SATURDAY, JULY 1, 1876.

No. 217, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

THE LAST DAYS OF MARY STUART.

Marie Stuart: son procès et son exécution, d'après le Journal inédit de Bourgoing.
Par M. R. Chantelauze. (Paris: E. Plon & Cie., 1876.)

THERE was found at Cluny some four years since a manuscript of the sixteenth century which there is every reason to believe is the Journal of Bourgoing, physician to Mary Queen of Scots during the latter years of her life. As her cousin, Claude de Guise, was abbot of the Benedictine monastery of Cluny at the time of her execution, the journal is supposed to have been deposited there, and to have found its way into private hands during the revolution of 1793. It contains a narrative of the last seven months of Mary's life—namely, from the arrest of her secretaries at Chartley, on the charge of their complicity with Babington, until her execution at Fotheringay. As she was kept a close prisoner during the whole of this time, and we know nothing of her except what her keepers have thought fit to tell, the Journal of Bourgoing throws much new and interesting light on the latter days of her unhappy life. M. Chantelauze, into whose hands the manuscript has fortunately fallen, is singularly well informed on the much-debated subject of Mary's history, and he has not only as a preface to the Journal presented his readers with a clear and concise account of the Babington plot, but has diligently compared the narrative of Bourgoing with every existing contemporary document. By a singular coincidence, about the very time of the discovery of Bourgoing's Journal the letter-books of Sir Amias Paulet were given to the public, and although Bourgoing was evidently a warm partisan of the Scottish Queen, and Paulet was one of her worst enemies, they mutually corroborate each other in a variety of material points. But as Bourgoing was in constant attendance upon the Queen he had much better opportunities for observation than Paulet, and as he kept a continuous narrative during the last seven months of her imprisonment he supplies us with much interesting information which is nowhere else to be found.

The Journal commences with an account of the removal of Mary from Chartley to Tixall and the arrest of her secretaries, Nam and Curle. The circumstances are well known. She was invited by Paulet to accompany him to see a buck-hunt in Sir Walter Aston's park, which was a few miles distant from Chartley; but instead of wit-

nessing a buck-hunt, she saw her two secretaries, whom she was never allowed to see again, arrested and hurried away to London, while she herself was kept a close prisoner at Tixall until all her papers at Chartley had been seized and carried off.

All these incidents are fully described in Paulet's correspondence, but we have now for the first time a description of the journey to Fotheringay. Mary, it appears, was apprehensive lest she should be attacked and slain under some pretext or other before she reached her destination. She rode in the coach which had been furnished to her by the French ambassador, and she sat, Bourgoing says, with her back to the horses, that she might more readily communicate with her coachman, and also that she might keep an eye on those who followed behind. Thomas Gorge, who had been employed by Walsingham to arrest Mary's secretaries, rode by her side, and he had under his orders 200 horsemen, all armed, one half of whom kept in front and one half in the rear of the royal captive. At Burton, where they stopped the first night, Gorge requested an interview with her, and made an earnest attempt, no doubt in pursuance of his orders, to draw from her a confession of her guilt. It is a circumstance strongly indicative of the weakness of their proofs against Mary that Elizabeth and her Ministers should again and again have sought to induce her to criminate herself. But these attempts invariably failed. In her interview with Gorge, which is described at length in the Journal before us, she avowed that in the utterly helpless condition to which she was reduced—being abandoned even by her son, who had made a separate treaty with Elizabeth—she had sought the intervention of foreign princes on her behalf. But she solemnly denied that she had ever directly or indirectly sought the life of the English Queen (Journal, pp. 491, 492). We may add that, from first to last, this was the substance of Mary's defence in answer to her alleged complicity in the Babington plot.

Mary reached Fotheringay on September 25, 1586, and some days after her arrival her keeper, Sir Amias Paulet, sent to say that he wished to say "five or six words" to her—his usual custom, says Bourgoing, when he had anything unpleasant to communicate. On the present occasion Paulet informed his prisoner that his mistress had heard with great pain of her crime, and that she was about to send certain lords and counsellors to Fotheringay to inquire into the matter. He earnestly advised her, therefore, as the case was so clear, to make a full confession, and ask pardon of her Majesty.

Mary, says the Journal, replied with a smile that they seemed to treat her as they treat little children when they have been guilty of some misconduct. She evidently saw that it was the object of her enemies to extort some admission from her that might justify her execution. Paulet insisted that the case was so clearly proved that it was in vain for her to deny it. But he succeeded no better than Gorge; and he finally took his leave, saying that he would communicate her answer to Elizabeth, by whose orders he had no doubt sought the interview.

These incidents are now made public for the first time. But the chief value of the Journal of Bourgoing is the account which it contains of the trial at Fotheringay. Our only sources of information respecting it have hitherto been Camden, the *State Trials* by Howell, and the *Hardwicke Papers*. But the Journal before us contains a much fuller narrative than any of these well-known authorities. It furnishes a variety of details that are not to be found elsewhere, and it contains many of Mary's speeches which are either omitted or much curtailed in Camden and Howell. The Journal agrees with them that Mary at first flatly refused to appear before Elizabeth's commissioners, but that she was finally induced to do so by the plausible but deceptive arguments of Sir Christopher Hatton. Bourgoing says that she spent the night before the trial in great perplexity, but she finally determined to appear, lest her refusal might be taken as a confession of her guilt. He himself attended her, along with Melvill, the Master of her Household, and four of her ladies. Renée Beauregard, the only French gentlewoman who accompanied her to Fotheringay, carried her train, and Gillis Mowbray, Jane Kennedy, and Elizabeth Curle followed, and took their places immediately behind the Queen.

The only piece of evidence produced against Mary to connect her with the conspiracy against Elizabeth was an intercepted letter alleged to have been addressed to Babington, who, along with his accomplices, had been by this time put to death. If Mary wrote this letter, she was unquestionably guilty. But the presumption is strong, if not irresistible, that it had been interpolated by the agents of Walsingham. The letter itself, which was originally in cipher, was not produced; nor was it stated at the trial by whom it had been deciphered. But we now know from the papers in the Record Office that the decipherer was the notorious Thomas Phillips, or Phellips, who by his own confession was an adept in the art of forgery as well as in that of deciphering. It is essential to note what Mary said when this letter was produced. According to the report in the *State Trials* and in Camden she said that "she knew not Babington; that she never received any letters from him, nor wrote any to him." But in the *Hardwicke Papers* we have a very different answer. According to them she said she had received "no such letter" from Babington, and had "written no such letter to him." When we turn to the Journal before us we find precisely the same language:—"Sa majesté desnia tout à plat d'avoir jamais veu telles lettres ny receu" (p. 523). She plainly meant that her correspondence had been tampered with, and she charged Walsingham to his face with having plotted both against her life and that of her son (Journal, p. 523).

Mary was not aware that by the then existing law (13 Eliz.) she could not be found guilty of high treason upon written evidence alone; nor did any one of her six-and-thirty judges think fit to inform her of this essential fact. But we now learn for the first time that when the alleged depositions of her two secretaries were produced

she stated that the signature of Nau did not appear to be genuine, and that it was not written in his ordinary hand (Journal, p. 526). As Nau was never examined in her presence, this statement throws additional suspicion on the whole proceedings.

Nothing could be more irregular than the mode in which the trial was conducted, if trial it could be called. The Lord Chancellor Bromley, the Queen's Serjeant, the Lord Treasurer, the Vice-Chamberlain Hatton, all took part indiscriminately in the proceedings, and all were alike eager to hunt to death the hapless Queen:—

"Her Majesty," says the Journal, "replied now to one, now to another, without any kind of order. For their sole object was to persuade the Lords that she was guilty, addressing always them, and no one asking a question on her behalf. So that the poor Princess said when she returned to her chamber that she was reminded, if she might venture on the comparison, of the Passion of our Lord and the clamour of his adversaries, '*tolle, tolle, crucifige*.' She added that she saw the Lords were not all hostile, but that those who were 'favourable to her' dared not avow their opinions" (p. 518).

On the second day, for the solemn farce lasted two whole days, Lord Burghley took upon himself the entire conduct of the trial. In the report published by his authority in the *State Trials* all his speeches are given in full and in the first person, while those of Mary are given in the third, as being comparatively unimportant. But in the Journal we have Mary's speeches reported in full, and it is easy to perceive why Burghley should have thought fit to curtail some, and wholly to suppress others. When taxed with aspiring to the English Crown she said she had never sought to deprive her sister of her just right; she only claimed, as her next heir, to be the second person in the realm; that she was the daughter of James V. of Scotland, and great-granddaughter of Henry VII., and that of the rights she derived through them she could be deprived by no law and no tribunal in the world; that it was on this account that her enemies, some of whom she was *prepared to name*, had sought her life, but that God in his infinite goodness had hitherto preserved her. Again, when allusion was made to her religion, she said that they knew well that in her own kingdom of Scotland she had never molested any one on account of his religion; she had even been censured for the toleration and clemency she had displayed, which, rendering her subjects turbulent and rebellious, had been the cause of her ruin; but that they had had good cause to rue the day when they exchanged her mild rule for the tyranny of Morton; that after his death their condition was in no way improved, for they were governed by a faction in the pay of England and traitors to their country (p. 533). It is easy to perceive why these and numerous other passages are only to be found in the Journal of Bourgoing.

As she was retiring on the second day she had to pass the table at which the lawyers sat, and turning to them with a cheerful countenance she made them the following farewell speech: "Gentlemen, you have treated somewhat rudely a person who is but little skilled in your laws of chicane.

But God forgive you, and God forbid that I should have anything more to do with you." The men of law, according to the Journal, exchanged smiling glances as Mary uttered these parting words, and thus the trial came to a close (p. 539). There is, or recently was, in the Bodleian an English contemporary manuscript which attributes words of a similar kind to Mary, but the author is unknown.

We learn from the Journal that after the trial another serious attempt was made to extort from Mary a confession of her guilt, but without effect (p. 543). Much of her time was now spent in reading English History, which she observed to Sir Amias Paulet was filled with scenes of blood. And when, a few weeks before her execution, she was deprived of the services both of her almoner and of the Master of her Household, Melvill, she said she was reminded of the fate of Richard II., who was deprived of one by one of his attendants before his murder.

The Journal extends to upwards of a hundred closely printed pages; and, assuming it to be genuine, we congratulate M. Chantelauze as well on his interesting discovery as on the satisfactory manner in which he has presented it to the public. JOHN HOSACK.

Pearls of the Pacific. By J. W. Boddam-Whetham. (London: Hurst & Blackett, 1876.)

Pearls of the Pacific, being interpreted, only means an account of a short visit to the Sandwich and Fiji Islands, with some of the intervening groups. It is "by the author of *Western Wanderings*," who must, therefore, we fear, be addicted to alliteration. It is useless to argue on a question of taste; still we confess to an instinctive misgiving about that of all persons who use such "conceits," from Fluellen downwards. But, having said thus much, we hasten to acquit our author of any grievous offences under this head. We regret, however, to find him too much given to little observations of a would-be funny but rather pointless order, which, even if passable in conversation, are hardly so as *litera scripta*. Some of them, perhaps, only mark the true British fear of being thought capable of any deep emotion, and perhaps a like fear of becoming pedantic leads him sometimes to use expressions hardly up to the level even of modern conversation. This is a pity in one who can on occasion express himself gracefully and well. He is, perhaps, too distrustful of his own powers, for he has "often envied the graphic powers of a certain author, of whom a lady once said to me, after reading a book of travels by him, 'It is so interesting that I really once or twice felt quite home-sick!'" He does not affect to go much below the surface of things, and thus treats sometimes of matters with which we are already sufficiently familiar. We have long ago had enough of the life on board a passenger ship: the quarrelling, dreaming, and flirting, the moonlight nights, and the phosphorescent sea. The only novelty is that in the piece of pork with which the shark's hook was baited a charge of dynamite was inserted; the re-

sult recalling the discharge of "vril" in the *Coming Race*. The same agent is employed with great but wasteful effect among the shoals of fish in the harbour of Levuka, Fiji. The author describes the great land-crab, which lives on cocoa-nuts, making its nest of the fibres, but he is mistaken in supposing it peculiar to that part of the Pacific, as it is at all events found in the Seychelles and in the Chagos Islands. That it climbs the trees and gathers the nuts has been disputed; but we hardly care to question the powers of a crab which can "dash a man to pieces" with a blow of its claw! A very strange phenomenon, vouched for by the author, is "a herd of cattle with the peculiarity of loose swinging horns, which resembled the immense ear-rings so fashionable a few years ago."

He had the good fortune to be present at Honolulu during the funeral of King Lunalilo and the election of his successor. The funeral was a picturesque combination of Christian rites grafted on national customs, with remains of the old superstitions. It lasted through the night, but was a tame affair compared with the horrible saturnalia which marked such events in former times. The author's descriptions of the luxuriant beauty of woodland and coast scenery, and of the desolate regions where volcanic action is seen on a grander scale than anywhere else in the world, are well written, and in good taste when not marred by a misplaced jocosity.

He lies under some disadvantage in traversing the ground so recently occupied by Miss Bird. It is not given to every man to carry away his readers with descriptive powers like hers—nor, we may add, to swim so many foaming torrents, or ride up and down such perpendicular mountains as did that enterprising, but withal modest, lady-traveller.

Our author did not appreciate the custom of "*lomi-lomi*," or shampooing, which it is a point of hospitality to perform upon a guest arriving after a journey. This "*lomi-lomi*" is also employed by Hawaiian gourmands at a heavy feast, to hasten digestion and enable them to return to the attack with fresh vigour. It is at least an advance in refinement on the old Roman practice.

The Hawaiians are described as a good-natured, happy race, intent on nothing but their amusements, into which they throw a good deal of energy, being admirable riders and swimmers. But they are rapidly dwindling away. This is attributed, very summarily, to that source of so much evil, the missionary, who, by forcing on a primitive people the unnatural restraints of civilised life, sapped their vigour and left them a prey to disease. But it was at least a natural mistake, finding a people equally devoid of clothing and of morality, to imagine some connexion, and to commence reform *ab extra*. Aesthetically no doubt the result is deplorable, and had the early missionaries been men of wider culture still more serious mistakes might have been avoided. It is easy, looking back, to criticise and condemn, but these men were daily called on to solve new and difficult questions, which they had never studied. Their frequent

assumption of lands and power was not necessarily wrong. These "Church lands" will not for many a day be a bar to progress, while their "temporal power" was anyhow a great advance in civilisation. It must not be forgotten that the present régime, however faulty, has within living memory replaced cannibalism, human sacrifices, and every sort of abomination and tyranny.

Mr. Boddam-Whetham discusses the origin of cannibalism, and attributes it partly to scarcity of food, which, especially where dependence is placed on a single staple, is a frequent source of great suffering. Superstition, he thinks, may also be a cause, as Fijian mothers rub their infants' lips with the flesh of a dead enemy. It is also a triumph over a foe to eat him; one thing only is more humiliating, viz., to refuse to eat him; and it is a further refinement of insult to cook him and then leave him un-eaten! The author believes that our annexation of Fiji will, among other advantages, lead to a general regulation of the labour-trade throughout the Pacific. At the same time he believes its abuses to be greatly exaggerated. The people are starving in many places, and willing to emigrate, so that, he argues, compulsion was needless. But this is something like the argument that slaves are never ill-treated, because it is against the masters' interest to do so.

The white settlers in Fiji are, we are told, by no means so black as they are painted; it was a comparatively small knot of rowdies who formed the "Government" under the late king, and it was high time for some Power to interfere in the interest of the respectable part of the community, both white and native.

A notable triumph of statesmanship is recorded from the Samoan Islands. Tax-paying is there actually a matter of rejoicing and festivity; a grand holiday is held, and free-will offerings even are sometimes added to the legal payment! And a new remedy for sleeplessness—a snake, imprisoned in a hollow bamboo, is placed under the pillow, and the hissing sound emitted is said to be highly soporific. COUTTS TROTTER.

Analysis of Religious Belief. By the late Viscount Amberley. (London: Trübner & Co., 1876.)

(Second Notice.)

WITH the fifth chapter of the first book, and the 190th page of the first volume, we enter on the largest section of the work—a summary account of the founders of historical religions, and the contents and character of sacred books. With regard to both we have some judicious general remarks. We are told that "prophets" always represent themselves as organs of a higher power, even when their message is as homely and naturalistic as that of Confucius, that the authority of the community they found is always conceived as subordinate to theirs, and that it is impossible for their followers to attribute to them a purely human personality. We are told that all sacred books are liable to be made the subjects of strained exegesis, that they are invested with a transcendental authority, that the mere act of

reading or hearing them is commonly regarded as meritorious, and that, lastly, their literary merit and attractiveness are seldom or never on a level with their authority. This is what might be expected: literary merit and attractiveness appeal to the "natural man;" a sacred literature establishes itself at a time when there is unusual interest in "the things of the spirit." At the same time it is to be remembered that sacred books differ very much as to their literary rank: some of the Hebrew and some of the Christian are to be placed on purely literary grounds among the classics of the world, and the sacred books of China are, to judge by the specimens of both hitherto translated, decidedly superior to the mass of Chinese literature. On the other hand, the best of the Iranian, and perhaps of the Arabic literature of Islam, is decidedly superior to the Koran, and the best parts of the Hindu epics and of the drama of the golden age have more literary interest than the Veda.

It is rather singular that neither Moses nor Abraham figures among the founders of religions; Abraham the writer might consistently refuse to recognise as an historical person, though it may be doubted whether the historical existence of Zarathustra is much better attested, and the latest investigations make the whole of Buddha's biography extremely problematical; but Moses is certainly historical, and upon the most sceptical hypothesis better known than Zarathustra, not to mention Lao-tze. Of course it would have been difficult to treat of Moses without coming to some decision on the criticism of the Pentateuch, which the writer naturally wished to avoid, as he was aware that it is hardly in a state to invite the adhesion of laymen to any particular view. On the same principle, he declines all mythological enquiries, and refers us to Cox's *Mythology of the Aryan Nations*; and here too the omission tells very much on the completeness of the work. In fact there is a point of view from which the whole laborious book is little better than a *missbegriff*. All civilised people are brought up to practise a certain religion, and to live under certain laws; it has not yet occurred to anybody to go through a course of comparative politics before deciding to obey the laws under which he was born: if his experience of them lead him to wish for a change, he proposes or supports the change he desires, and it is admitted that he is in his right, though he is expected to admit that, *ceteris paribus*, those who have an extensive acquaintance with other institutions are likely to be better judges of the changes proposed; but after all, the study of comparative politics has only a speculative interest. Perhaps the reason that so many people now-a-days are inclined to take more than a speculative interest in the study of comparative religion, is that they hardly feel that religion in any shape is altogether practical. Still we feel at every point how premature a comprehensive treatise on comparative religion is. For instance, it is clear that to a Chinese Mencius represents a substantial advance upon Confucius, but in the present state of Sinology the difference is hardly visible in Europe, and how until we are

better informed can we tell whether the religion of the Mandarins was capable of real progress? Again, is Ahura Mazda one of the Asuras who are devils in Hindostan? If so, it is obvious that a tolerably complete knowledge of the difference between the climate of Bactria and that of the Punjab and the north-west provinces three or four thousand years ago is needed to explain why the same personifications of natural powers are hateful in one region and adorable in another. Why, again, did the Mazda-worshippers take to tilling the ground at a time when the Deva-worshippers still claved to cattle-breeding and cattle-lifting? Why was Mitra alone of the Vedic deities retained with Homa as an object of worship in Iran? How much of the Avesta refers to the trials of the Mazda-worshippers at the time of the first separation? how much to the trials of the time which preceded the conquest of the snake-worshippers of Media, and of the idols of the Euphrates under Cyrus and Darius Hystaspes? How can we judge the Zend religion till we know? No doubt it will be long before we know: at present we have hardly got beyond the alphabet of mythology; we do not even know whether the heroes of nature-myths are personifications of natural objects or of natural processes, nor how much of floating fable has gathered round actual men and women who towered in their day above the herd as floating clouds gather round high mountains; and we hasten, and Lord Amberley among the foremost, to darken counsel by words without knowledge, and as soon as we decide to disbelieve most of the stories about a legendary hero or heroine, instead of saying so simply we call them mythical, and imply that they never lived. Considering how many fables are told of Charlemagne and St. Gregory the Great, it is probable that the fables told of Arthur and Viswamitra are really the measure of their historical greatness.

Lord Amberley succeeds better when he comes to deal with religions which are better known. The appreciation of Mohammed is very well balanced, generous, succinct, and just, in spite of one grave omission: it is clear that Mohammed, like Buddha, repudiated all miraculous powers: it can hardly be disputed (Lord Amberley fully admits it) that the Founder of Christianity habitually appealed to His miracles, while rebuking the demand for them: from every point of view the contrast deserves discussion. The treatment of the synoptic miracles is one of the best parts of the book. The writer does not allow himself to trifle with abstractions, but works out the rationalist thesis in a concrete, sensible way. According to him, there were many people whose overstrained, nervous condition resulted in madness or simulated other disorders to which a great spiritual teacher would naturally be able to give at least temporary relief, and he very fairly lays stress on the fact that the upper classes ignored the excitement of the uneducated, with its real basis if it had any, and whenever they were roused to attention demanded a "sign," i.e., a wonder announced beforehand. He is aware that the miracles of the Fourth Gospel will hardly yield to such solvents; upon the tra-

ditional theory of its origin they may very well have been selected to show that the magicians of Ephesus could not do so with their enchantments; but he rests his rejection of the Fourth Gospel exclusively upon the arguments rejected in Germany until they were reinforced by Baur. In fact, all his evangelical criticism is superficial, and not on a level with the latest researches. Whatever may be said of the first two synoptics, the third is in no intelligible sense an anonymous impersonal compilation; he has no sense of the weight of opinion counter to which he drifts towards the assumption that the second synoptic is the most primitive form of the tradition, and it has never occurred to him that when we have the opportunity of comparing perfectly authentic narratives of the same event it is generally found that the later add something to the earlier.

When we have made allowance for this, and for the point of view of a writer who can estimate the comparative excellence of Confucius, Buddha, and Jesus, Lord Amberley's Christology repays study. After all there is much more to be learnt from the Gospels than from what has been written about them, and Lord Amberley had read them diligently with an open mind. He gives the true unsophisticated account of the Kingdom of Heaven as a thorough change in the visible order of things, though he does not give quite their due weight to the parables where this change is represented as manifesting itself at first, and that gradually, in the spiritual order. He is right, too, in calling attention to the strong *prima facie* contrast between the tone in which the Scribes and Pharisees are denounced and the precept of universal love, though few readers will accept his explanation of the contrast as simply a degrading inconsistency. He is probably wrong in thinking that the conflict between Jesus and the Pharisees turned in the first instance upon His claim to be Messiah; it turned so far as we can see chiefly upon His resistance to some new obligations about the Sabbath and ablutions which the Pharisees were then in process of imposing, for though His claim to forgive sins startled them, they did not interpret this as an assertion of Messiahship. In fact, this claim was systematically kept in the background till after the confession of Peter, and probably was more offensive and alarming to the Temple aristocracy than to the Pharisees. Though the writer assumes a solidarity which did not exist between the two sections of the enemies of Jesus, his account of the case for the prosecution is instructive, for very few of us yet realise that people may be detestably wrong and still have a good deal to say for themselves and really think they are in the right. The criticism of the narratives of the Resurrection is less original, but the psychological explanation of the belief in the Resurrection and Ascension is very fine, both in feeling and expression. It turns upon the difficulty loving mourners always have in believing in their loss: as the writer says, it is quite conceivable that this difficulty should give rise to illusions, but it is hard to see how an illusion could last and leave sanity of judgment unimpaired and the practical efficiency

of its subjects heightened. There is a curious dissertation in the manner of the late Mr. Mill upon the limitations under which we may give a qualified acceptance to the morality of the Sermon on the Mount, which intelligent believers will read with a sigh of relief. Current morality at its best is one thing, and the morality of the Sermon on the Mount is another. When good kindly folk, anxious to make the best of both worlds, cling to the tradition that they are the same, that is touching and natural; it is nothing short of offensive when theologians who do believe in the morality of Confucius and do not believe in the morality of the Sermon on the Mount profess to reject the "supernatural dogmas" of the Gospel because they revere its "eternal morality." It is certainly a gain to be reminded of the way in which Lao-tze anticipates one of the most characteristic sides of Christianity by his perception of the power of self-abnegation, his attitude of dependence as a son who can do nothing of himself except what he sees the heavenly Mother do, and his recognition of the truth which, as Lord Amberley points out, is well expressed in the *Theaetetus*, that the children of this world are in their generation wiser than the children of light. Though Lord Amberley was not the first to observe that Buddha's passion for universal salvation is an anticipation of another side of Christianity, the observation is quite in place; but it is a mistake to cite the noble boast of Mencius, that his family affections and success as a teacher more than compensated him for his failure as a statesman, as a parallel to the rebuke to the disciples for striving for the first place. As might be expected, great prominence is given to the legend of the miraculous conception of Buddha, and no doubt orthodox theologians will be in a better position when they have a scientific theory of that legend and of its relation to their own belief. But the mere juxtaposition of the two does not settle the question as the writer supposes, for this reason, if for no other—the *Lalita Vistara* cannot be traced within a century of Buddha; the Apocryphal Gospels of the Infancy can be plausibly traced within a century of Christ.

We cannot follow the writer through his *précis* of the sacred books of the world, which is enlivened by well-chosen extracts. In the Old Testament he follows Ewald, and rather gratuitously commits himself to Goethe's clever theory that the Ten Commandments written on the tables of stone are to be sought for in Exodus xxxi. 18, *sqq.*; the treatment of the Psalms is strangely meagre; and, though the article on St. Paul is substantial, there is hardly a word on the essential antithesis between the works of the law and the righteousness of faith: it is characteristic that the writer fears that the Apostle carried condescension to the Jews too far. The chapters on "The God of Israel" and "The God of Christendom" are characteristic too; the standpoint is that of eighteenth-century Deism pure and simple, and this is really ominous—"the clouds return after the rain." The Deists asked, Does it become us to honour a Being of whom such things are said? and the question was adjourned rather than answered by the series of religious movements in England which, roughly

speaking, began with Wesley, and by the school of imaginative historical criticism initiated by Lessing and Herder in Germany, which Dr. Stanley has attempted to naturalise here. The latter school would perhaps have contributed more than they have to the answer which must be given soon, if at all, if they had maintained boldly that things may be virtues in a simple society which become vices in a complex one. There is much in the history of China and Israel to suggest that disinterested vindictiveness was once a distinctive characteristic of the superior man. China, too, suggests that the movement of opinion is not always an advance: most readers will think Confucius asking "does Heaven speak?" wiser than Lord Amberley complaining of a fact, the traces of which are not confined to the Bible, that sinners are punished with little or no warning.

"Under the touch of a comparative anatomy of creeds all that was imposing and magnificent in the edifice of theology crumbles into dust, systems of thought piled up with elaborate care, philosophies evolved by centuries of toilsome preparation, fall into shapeless ruin at our feet. And all this by the simple process of putting them side by side."

Here we have one side of the thesis of the second book, which deals, as we said, with the religious sentiment itself. It is curious that such a thesis can be put forward seriously, and that most readers will feel some inclination to accept it. What would be thought of a disputant who should argue from the fact of the diversity of the institutions under which civilised people live, to the proposition that all particular institutions must be worthless, and then go on to argue that some institutions in general are required by human nature, and may even have some foundation in the nature of things? Special rites and special institutions have their validity under special conditions, and this is not impaired by the fact that the appropriate institutions or rites may be mistaken or perverted, and that experience shows this is more likely to happen to rites of the two. No doubt social and religious traditions continually tend through the imperfection of our race to hamper the religious and the social sentiment; and the author is quite right in noting the reaction of the religious sentiment against this tendency as one of the most important factors in religious history, but he ignores another factor at least as important—the tendency of the religious sentiment while it retains its vigour to embody itself in ideals suggested by life and transcending it. In the greatest religions the later ideals presuppose acceptance of the earlier, and Lord Amberley has some good remarks upon the common tendency to interpose a lengthening hierarchy of mediators between the soul and the Most High. He also does well to point out that the intellect always co-operates with the emotions in the revolt against traditions which have become burdensome (as it co-operates with the emotions and the imagination in forming new ideals); he stops short of the question whether the co-operation of the intellect in the destructive process does not become more and more important as knowledge accumulates, till the religious

sentiment is likely to die out except among the minority who may be prepared to sacrifice all to it. Although Lord Amberley committed himself to the preposterous view that all embodiment of the religious sentiment is illegitimate, few modern writers have argued better in defence of the doctrine that both the objective and subjective elements of consciousness imply something which seems to lie outside the possibility of scientific analysis, which can hardly be better described than under the old names of God and the Soul. His reconciliation of Berkeley and Spencer is, to say the least, ingenious; and his criticism of Mill is instructive and fresh: we have only room for a single inadequate specimen:—

"To oppose to a necessary belief such a train of reasoning as this—

Necessary beliefs (so-called) have often proved false;

This is a necessary belief (so-called):

Therefore it may prove false,

is in reality to overthrow a strong conviction by a weak one; an intuition by a syllogism; a proposition felt immediately to be true by an inference open to discussion. Arguments like this resemble the procedure of a man who should tell us when we meet a friend that we cannot possibly be sure of his identity because on some previous occasion of our lives we mistook Jones for Thompson."

In spite of his resolute defence of the fundamental postulates of spiritual philosophy, it had occurred to the writer that an increasing number of his contemporaries would find a vague sentiment debarred from all definite expression unsatisfactory. It was not to be expected that he would recommend a return to the old doctrine that theology is the queen to which other sciences must bow. But short of this radical cure he gave the best possible advice, to cultivate by all means the sense of human brotherhood. If it could be extensively followed orthodoxy would have no reason to complain of the result; if we could escape from the sterilising influence of the egoism which divides and isolates us, old ideals would be lighted up and new ideals would come into sight. Nothing has happened yet to discredit the observation of an author whose simplicity rather than his depth had struck Lord Amberley. "He that dwelleth in love dwelleth in God and God in him."

G. A. SIMCOX.

The Tragedy of Israel. By George Francis Armstrong. Part I., *King Saul*. Part II., *King David*. Part III., *King Solomon*. (London: Longmans & Co., 1872-4-6.)

It is by no means an easy task to digest and arrange the critical impressions which are produced by a work of such magnitude as Mr. Armstrong's *Tragedy of Israel*. A play, or rather a series of plays, covering three generations of eventful history, occupying nearly 700 pages, and containing something like a hundred and fifty characters, many of them of great interest and intricacy, is no light matter to handle. And when it becomes evident, as it very soon must to any reader of Mr. Armstrong's volume, that to the energy of purpose necessary to approach and grapple with a theme so gigantic, there has been joined a patience in execution which has allowed of no

slovenly work to the best of its judgment, no mean skill in the mechanism of verse, a fancy fertile in conceptions which not seldom reach grandeur, and a remarkable descriptive faculty, it becomes still more necessary to gird up one's critical loins to tackle the question, How far have these good gifts been successfully used?

In order to answer this question it must be remembered that in the matter of the tragic drama the "total-impression" theory, which in respect of other branches of poetry is a theory and disputable, becomes indisputable and a fact. A tragedy which has not a central point of moral interest, round which all the subordinate incidents and characters are harmoniously grouped, may be whatever else it likes, but it is not a tragedy. Now the Biblical narrative of the first three kings of Israel does unquestionably provide a succession of such central points with the due retinue of subordinates to group around them. In the first place there is Saul, the keynote of whose character is distinctly the "pride of life." Masterfulness and impatience of control are obviously the moving springs of his actions, whether in the swift chastisement of the insolence of Nahash, the hasty sacrifice at Gilgal, the disobedient sparing of Amalek, or the stern discipline which would have sacrificed Jonathan. The wear and torture of ceaseless conflict between this independence and the resistless over-lordship of Jehovah, and the mental agony of feeling himself a king only in name (his successor being already appointed over his head), are as obviously the cause of his later madness, and of his capricious tyranny towards David.

In David, again, the master-motive is evidently the "lust of the flesh," in a wide and not offensive sense. A vivid appreciation of all the pleasures of living, sharp sorrows and sharp joys, a temper prone enough to err, but docile to repent, are characteristic of him in all his doings and sufferings, his prosperity and adversity, as is also throughout a remarkable simplicity and impulsiveness.

Both these characters are, it seems to us, given clearly in the narrative, and fit with great art and completeness into the circumstances under which they are evolved. The character of Solomon is not evolved in Holy Writ with equal clearness, the pen having apparently fallen into the hands of a less dramatically gifted writer, who took more pleasure in merely material gorgeousness. But enough of it is manifested to show that in Solomon the triad was completed, and that the "lust of the eyes" was his characteristic. A perpetual thirst for novelty, in knowledge, in pleasure, in religion, in art, in science, may be safely assigned to him.

Now, it may be said that, even granting that this is a just deciphering of the characters of these kings as given in Scripture, Mr. Armstrong was by no means bound to accept it. No doubt this is true; but if Mr. Armstrong, accepting the Biblical narrative as to facts (as he does), gives a rendering of the characters inconsistent with those facts, he has exposed himself to censure. In the first of these tragedies we have Saul presented to us in the guise of a morbid

humanitarian, horrified at the sanguinary character of the Divine commands, and determined to do justice and love mercy. We have no intention of raising the parrot-cry of anachronism against this: any poet has liberty, as far as we are concerned, to anachronise as much as it pleases him, yet so as that the laws of art be not broken. Here these laws are broken. Did Saul spare the Amalekites, or did he spare sheep and oxen? Did his commission to Doeg look much like aversion from bloodshed? Did his fitful persecution of David more resemble wounded pride or indignation at the favourite of an unworthy Deity?

Still more unfortunate is the presentation of David. We shall be content to let our disapproval of this rest on the scenes with Bathsheba and with Nathan. It does not require much perusal of Mr. Armstrong to see that he is not a passed master in the art of Love: but the crowning scene in David's wooing of Bathsheba shows it beyond a doubt. The monarch comes to the conclusion that in some mysterious way his realm and future welfare make it necessary for him to follow his inclinations; and Bathsheba says that she admires him so much that she shall be only too happy. Drinking tea by stratagem is simple and direct compared with this fashion of committing adultery! Compare the simplicity of the original: "And the woman was very beautiful, and David sent and took her." Again, there is perhaps no triumph of dramatic art in Holy Writ superior to the famous "Thou art the man" and its context. Mr. Armstrong has given us in its place twenty pages of endless verbiage about "mirrored microcosms," and what not.

King Solomon is in the portraiture of the hero the best of the three plays, though we cannot help regarding Mr. Armstrong's determination to account for the wise king's idolatry by a sort of anticipation of the Bolingbrokeian "Jehovah, Jove, or Lord" latitudinarianism, as a mistake, historically and poetically. It is also the best, in that the scores of characters introduced do not here, as in the earlier plays, fail entirely to form any effectual background or chorus to the central figures. Here and there, as with Agag in *Saul*, and Jonadab in *David*, are parts which "intend greatly." But the intention is almost all; nor is it difficult to account for this and other failures, strange as they may seem at first sight.

We think that Mr. Armstrong has been in some sort the victim (like another and greater poet of our time, to whom he owes much—the author of *Stratford*) of a fatal facility in versification and in thought. He has at his disposal a fertile imagination and a remarkable command of blank verse, not wanting in either dignity or flexibility. Forgetting, therefore, the great canon, "blank verse is not argument," he allows his characters to float themselves off anywhere and anyhow on an impetuous stream of declamation, which sometimes goes on till the bewildered reader loses himself utterly, and wonders what on earth it is all about. Dramatic propriety, coherence, central tendency, are too often all flung to the winds that this luxury of voluble utterance may be indulged in. It must, however, be ad-

mitted that *King Solomon*, which, as we have said, is the best in other respects, is also much more free from this great fault than its predecessors. It has not the grand choruses (choruses perhaps a little too *Atalantesque*) of *King Saul*, nor has it any passages quite so good as some of Samuel's and David's speeches in that play. But it is infinitely superior to *King David* as well in dramatic construction as in poetical beauty.

The first act in particular is composed of scenes the sketching and grouping of which are both very good. The flight of the Edomite patriot Hadad, the departure of the Queen of Sheba from Jerusalem, the journeying of Jeroboam to seek his unknown fortune, the questionings of Solomon with his wise men, the wild freedom of Rezon and his Syrian banditti, the hard slavery of the King's public works, and the magnificence of the greatest of those works related by its architect Hiram to the King of Tyre, are all excellently drawn and lead on cunningly to the last scene (a very powerful one) in which the aged prophet Nathan expresses to the King his vague fears, and rebukes beforehand the latter's hardly-purposed religious innovations by the recital of a dream. This dream is incomparably the best thing in the book; unfortunately it is seven pages long, and therefore, as is too often the case with Mr. Armstrong's best things, it is impossible to quote it. The later acts work out the problem and show how the purpose of introducing strange gods is fulfilled and followed by speedy retribution. The two following passages may perhaps give some idea of Mr. Armstrong's style. The first is a speech of Solomon's, delivered on the top of Hermon, whither he has retired to resolve finally on his plan of cosmopolitan worship:—

"See how the shadows lengthen in the vales,
Bearing sweet slumber to the forest birds
And coolness to the feet of wandering kine;
And yonder day goes down the purple sea,
Takes not the mountain now a lonelier air,
A deeper silence? And the Spirit of Earth
And the wide Heaven seem like a throbbing lute
To vibrate to the inward ear, and breathe
Music-like words. . . . O lone and mateless peak,
Whose brow shall lighten in the breezy dawns,
High-towering when the nations at thy feet
Shall be a misty memory, and empires
On empires' ashes strewn shall round thee lie
Coffined in dust,—far o'er the track of minds
Thou hast lifted me, and yielded to my heart
Something of thine own being, lone and proud,
And send'st me rich away!"

The second is the dying utterance of Hadad:—

"Set ye my face toward Israel.
I came too soon. The help of Egypt's hand
Hath not sufficed. Ye cannot multiply
Thin bands with gold, or spears, or promised aid.
I have fought a forlorn fight: yet have not failed.
I say I have not failed: for I have drawn
The Tribes asunder; I have help to set
Egypt 'gainst David's house; and when the strife
Comes which awaits the death of the lewd King,
And Israel with Judah shall make war,
Then shall frail Edom gather goodly strength
And spoil and trample Judah, and his kings
Dishonour, and make free our wasted hills.
Teach ye your sons to watch. . . . But thou, O
Land,
O Israel, cursed be thine habitants
For ever! Lo, thy day is wellnigh spent,
Thy glory like a leaf drops to the clay!
It is enough. Set me upon the ground
And let my mountains fold me in my rest. [Dies.]

It is impossible to express the total effect of Mr. Armstrong's work better than by one of the commonplaces of criticism. He would have achieved very much more if he had attempted less, and had more clearly defined his own attempt to himself.

GEORGE SAINTSBURY.

Old and New London: A Narrative of its History, its People and its Places. Vol. II. By Walter Thornbury. Vol. III. *Westminster and the Western Suburbs.* By Edward Walford. (London: Cassell, Petter & Galpin, 1874-75.)

A HISTORY of London is wanted that would give the reader a complete view of the various changes that have taken place in the town at different periods of its growth. This would be a help both to the painter and to the historian. Macaulay, when he commenced his *History*, felt keenly the want of such a book, and he has himself left us a model sketch of the state of London at the accession of James II.

The old books give the history of the City, with its companies and officers, but Westminster and the immense districts west of Temple Bar that make up our modern London have been very scurvily treated. Even these old books are more occupied with the various occurrences than with pictures of the changes of habits and the alteration in the configuration of the streets. What is required is a work in which the several histories of occurrences, of changes, and of celebrated inhabitants, should each find its proper place. At present almost all the books on London are chiefly occupied with anecdotes of the inhabitants. No master has arisen to reduce topography to system, and raise these books from the miscellanies they are to the helps to study that they ought to be. There is no reason why the history of a city should, any more than the history of a country, be a disconnected collection of anecdotes. The author should not merely tell what has occurred, but point out the causes that led to the occurrences. For instance, it is needful in tracing the history of London to point out the effect upon its prosperity of the foreign elements that were introduced at various times.

Charles Knight attempted to fill this large open ground, but failed from want of system. Peter Cunningham found the arrangement of his materials so difficult a matter that he was forced into adopting the alphabetical order, by which his book has become a most valuable work of reference, but not one for continuous reading.

There is reason to believe that the first Roman London extended over ground upon the south portion of which Thames Street was afterwards built, and that Dowgate was its western and Billingsgate its eastern gate. Outside the boundary of this small area signs of burial places have been discovered in Goodman Fields, Spitalfields, Bishopsgate, and St. Paul's Churchyard. During the several centuries that the Romans occupied this island London was greatly enlarged, and the walls were made to enclose some of these cemeteries. The area of the enlarged city remained the same for many centuries after Roman times, and was little different from

that enclosed by the later walls. Our records of Saxon London are very scant, and the larger part of its history is occupied by an account of the frequent incursions of the Danes. For a long period London seems to have held a somewhat analogous position to the Free towns of Germany, as though an important, it was not a capital, city. That position was held by York in the north, and by Winchester in the south. The fact that Edward the Confessor built a palace at Westminster is sometimes brought forward as an evidence of London having become a Royal residence, but Westminster at that time was as separate from London as Windsor is now. With the advent of the Normans a great change took place in the appearance and position of London, and William the Conqueror seems to have built the Tower in order to intimidate the refractory Londoners. Everywhere great architectural activity was apparent. Religious houses were founded, and these buildings were erected in stone. London, therefore, gradually grew into a fine city (called by some of our old poets "lovely London"), and in Henry the Fifth's reign our forefathers were so far civilised as to light their streets. Houses were not very closely packed, and there were orchards in such places as Paternoster Row and Ivy Lane. Outside the walls the roads were still more rural. Shakspeare tells us of the strawberries for which Hatton Garden was once famous, and long subsequently to Richard the Third's reign bushels of roses were gathered at the same place. Here and there were traces of the vineyards that the Romans had planted, and in Charles the First's reign melons thrived in Tothill Fields.

Tudor London is of great interest to us, because for the first time we learn from contemporary maps what it was really like. Our earliest view of the city is that by Van den Wyngerde, dated 1543. In Henry VIII.'s reign the great marsh of Moorfields was levelled, and the landholders of the hamlets of Islington, Hoxton, and Shoreditch fenced their lands and brought them into cultivation. In the middle of the sixteenth century Holborn and several other streets were paved. In Elizabeth's reign the walls still surrounded the chief part of London, but the roads that led from the principal gates were largely built upon.

Round the City were various little villages interspersed with large wooded districts. St. John's Wood was once a famous hunting ground, and the Lord Mayor and Corporation periodically hunted the hare and fox at Bayswater and Paddington. The dogs belonging to the city were kept in the fields westward of the village of St. Giles, from which originated the name of Soho, the old equivalent of "tally-ho."

The position of the centre of London has been shifted in different centuries, and gradually progressed westward, until at last the movement was stopped. The City and the West End became distinct centres for distinct objects, and the Bank remains the heart of the one, as Charing Cross is of the other. The first general emigration westward by the laity—for the bishops had long before settled in the Strand—was made in the reign of James I. Lord Herbert of Cherbury and

many others went to Great Queen Street, which was built about 1629, and called after Henrietta Maria. In the latter part of Charles the First's reign, and during the Commonwealth, Covent Garden became the fashionable quarter. At the Restoration St. James's started into favour, and has retained its position ever since. Grosvenor Square came into existence early in the eighteenth century, and Belgravia dates from the end of George the Fourth's reign. The first emigration of the London merchants westward was about the middle of the last century; and only those who had already secured large fortunes and possessed reputations beyond the shadow of a doubt ventured as far as Hatton Garden.

We have here only noted a few of the points that should be brought out by such a History as is wanted, and its author's greatest difficulty would be to weld into a whole the mass of materials at his disposal. Each of the London districts has a history distinct from that of the City, for the metropolis is so wanting in centre and unity, and has so feeble a digestion with its large appetite, that the author has to treat as a whole what never has been one.

The book before us does not fulfil the conditions we have sketched, although it is entertaining and full of anecdote. Information about the various changes may be found in it, but the instances are never brought together, and the reader therefore closes the book with no vivid impression left on his mind. The second volume by Mr. Thornbury completes the history of London east of Temple Bar, and contains, besides chapters on London Bridge, the Tower and several important streets, accounts of the districts of Stepney, Whitechapel, Bethnal Green, Spitalfields, Islington, Canonbury, Highbury, Pentonville, and Clerkenwell. The size of the book would not allow of the insertion of all that could be said of these places, but the author might have given some account of Sir Balthazar Gerbier and his academy at Bethnal Green in place of the two columns devoted to the Wallace collection of pictures. In 1642 Gerbier's enemies reported that he "had six brasse pieces in his house wherewith he might batter down all the houses on the greene." The book is largely made up of extracts from books and newspapers, and as most of the information is taken from second-hand sources the most unexpected persons often appear as authorities for the facts.

Mr. Walford enjoys an advantage over Mr. Thornbury in the comparative freshness of his subject, and in the third volume he makes good use of the abundant materials for a history of the West End which were at his command. Here are chapters on the Strand, with its churches, theatres, taverns, and shops; Whitehall, with its masques and revels, from the days when Wolsey lorded it at York Place to the destruction of the palace by fire; Westminster Abbey, with its monuments and waxworks; and Westminster Hall, with its trials and pageants. Soho and the French refugees; St. Giles's and the lepers; and Covent Garden and the players, are not forgotten; and we also see Charing Cross as it was when St. Martin's was really in the fields, and long before Trafalgar

Square was found to be "the finest site in Europe."

If this book does not answer our expectations of what a History of London should be, it still contains much interesting matter, and is especially valuable on account of the numerous engravings, which both illustrate the letter-press and help to save the relics of the past from entirely passing out of remembrance. HENRY B. WHEATLEY.

NEW NOVELS.

Lillian's Child. By M. H. L. Three Volumes. (London: Sampson Low & Co., 1876.)

Llanthony Cocklewigh. By the Rev. Stephen Shepherd Maguth, LL.B. Cantab. Three Volumes. (London: Samuel Tinsley, 1876.)

Lola, a Tale of the Rock. By Arthur Griffiths. Three Volumes. (London: Smith, Elder & Co., 1876.)

"LILLIAN'S CHILD" is a little girl who is unclaimed in a railway accident and is adopted by the daughter of a country squire. Lillian Jocelyn, her guardian, had been disappointed: her wedding-day had been fixed, but when she walked up the aisle of the church, "looking very lovely," she did not find the bridegroom waiting for her, but was handed a note from him, saying, "Forget and forgive me;" so she went home again and led an exemplary life, and adopted the little unclaimed girl, and the child of course turns out to be the daughter of the recreant lover who had early made an imprudent match and imagined his wife dead. When Helen, the adopted child, grows up beautiful and attractive, she is engaged to Cecil Jocelyn, a young sailor, who is brother to her guardian, and here the story might have pleasantly ended. But this only brings us to the end of the first volume, and we have two more to get through; therefore Helen meets her father at a ball, and, from an inexplicable feeling of duty, she leaves the man she has promised to marry, only consoling herself by "taking out her beautiful inlaid desk which Lillian had given her," and writing letters of farewell "on the paper, with the initials H. J., which had been a mark of the tender love showered upon her"—the love which she believes it right to sacrifice to the caprice of a man who has no reason that can be discovered for concealing his whereabouts. "At half-past six in the morning, being ready all but her bonnet, she fell on her knees and prayed for strength and guidance," and then having put on the bonnet, which is elaborately described, she stole out of the home where she had been treated with so much kindness, and fled to the Continent with her father, Lord Norrice, to whom it is questionable whether she owes either duty or gratitude. She completely ignores her former friends, and devotes herself to nursing her invalid mother till the third volume is nearly ended, when there comes a gleam of light—only too quickly followed by a melancholy and seemingly unnecessary catastrophe. The book is harmless, though it is not strong. We are told of "pet girls," "pet poor

people," and "pet pictures;" and the reader would imagine from the reckless and inaccurate manner in which duchesses and lords are introduced that the story had been originally written for a penny journal. No one can help smiling when the woman who has just condescended to accept a country clergyman consoles herself by saying to him, "I shall still be Sybella, Dowager Duchess of Haslewood."

When an author boldly avows in a pretentious preface that his book is the "living reflection of his own feelings and observations," and also that such "a mental creature, out of the archives of human thought, does more than all else to humanise and civilise mankind," the reader might without very high expectations be led to look for something better than that which the Rev. Stephen Maguth has produced, for the only words which can in any adequate way describe *Llanthony Cocklewigh* may be quoted from p. 252 of vol. iii.: "I have read an immense deal of fiction, and that's a fact; but I have never read any such fictitious rubbish as friend Soddy is inspired to utter." The book purports to relate in autobiographical form the experiences of a scapegrace tradesman, who through misfortune is brought to a knowledge of the error of his ways, and, after performing the part of a hairy man from America in a travelling theatre, and going through some experiences in a circus, finds himself heir to a comfortable fortune. To use no stronger terms, the confusion and weakness of the style baffle description.

Lola, a Tale of the Rock, is a spirited book. The "Rock" is of course Gibraltar, and the story will be popular in barrack-rooms and clubs. It is too much interlarded with Spanish words, but Lola herself is a charming young Spanish girl, and her adventures remind us of some ballad where the brave knight on a fiery steed carries off the distressed damsel from her prison-house. Lola is the grand-daughter of a money-lender, and is jealously guarded by him, but is seen at a bull-fight by Frank Wriottesley, a young English officer. Through the good offices of the duenna, the young people are engaged to each other, but when it comes to the ears of the money-lender Bellota, the old man in jealous rage sends his grandchild to the care of her maiden aunts in England. Thither Frank found his way, and so won the hearts of the old ladies that they would probably have consented to his marriage had not the grandfather again summoned Lola to Spain, where he committed her to the custody of some cousins, who kept her under lock and key. At this point the chief excitement of the story commences: Frank finds her out, and carries her off on his horse, but a certain Spaniard named Pepe, who owes him a grudge, stops their flight and leaves him senseless on the ground. It is rather surprising that, though Lola had been on his horse, Frank did not seem to trouble himself at all about her when he recovered. He looked for his horse, his watch, his money, his ring, but never for his lady-love. The author knows that she is safe, and takes it for granted that his hero does the same, which is a failure in dramatic skill. Lola is now kept a closer prisoner than

ever, but her persevering lover again carries her off on horseback, and the account of the flight over the wild stretches of upland is well given. However, the revengeful Pepe is at last successful, and Frank is shot and falls, while Lola is carried back again to her family, from whom she finally escapes to England by herself. It would not be fair to betray the happy *dénouement* of a story which depends so much on its wild and somewhat improbable plot; but as a whole the book is amusing, the descriptions of Spain are good, and the passionate southern character, with its influence for good and for evil, is well touched upon, though not elaborately worked out. F. M. OWEN.

SCHOOL BOOKS.

An Elementary English Grammar for the use of Schools. By R. G. Latham. New Edition. (Longmans.) The title of this well-known book is perhaps misleading; it is elementary only in so far as it serves as an introduction to larger works written from the stand-point of comparative philology. But it strikes us as an admirable book to put into the hands of boys in the highest forms, not only in order to teach them something about the formation of their own language, but also to set them thinking about general grammatical principles from a new point of view. It begins with an historical introduction, purposely limited in its range, as a full discussion of the subject is reserved for a larger work. Among the chief points treated are, the puzzling phrase *littus Saxonicum*; the grounds for preferring the horizontal division of English into Mercian, Northumbrian, and West Saxon, each of course with its several stages of development, to the vertical division into Anglo-Saxon, Semi-Saxon, Old English, &c.; and, lastly, the linguistic arguments for the now familiar truth that Englishmen are Englishmen, and not Welshmen or Frenchmen. In the strictly grammatical part we may notice as particularly interesting the article on abstract and concrete nouns, the examination of the participle and the gerund in *ing*, the distinction between which is, of course, now generally recognised, and, lastly, the very full discussion of the grounds for believing the strong and weak forms of the English Perfect to be survivals of distinct tenses.

Handbook of the History of the English Language. By A. H. Keane, B.A. New Edition. (Longmans.) Both as a compendium for the use of candidates for examination, and as presenting, in a popular form, much comparatively inaccessible information, this book has considerable merits. The author has gone to the best authorities, and has worked out some points carefully. He has, for example, exhibited very clearly the transition from classical Anglo-Saxon through a period of neglected grammar, which he calls broken Saxon (in preference to Semi-Saxon), to the less and less inflected language of succeeding centuries. But he is too much occupied in tracing the successive stages of the language to have kept constantly in mind the horizontal division, the division into dialects, which Dr. Latham has so clearly expounded. Thus he refers almost exclusively to processes of growth and decay the difference between Layamon's *Brut* and the *Ormulum*, without giving due weight to the fact that the one is a West Saxon, the other a Mercian production. The concluding chapter on Modern English hardly answers to its title; it contains some useful material that should have been worked up in the earlier part of the book, but leaves, perhaps intentionally, almost untouched the changes of style that have taken place in the last three centuries.

First Work in English, by A. M. Murison, M.A. (Longmans) is intended to teach English grammar, and to give some facility in composition by applying the principle of substitution. A pupil is required to replace an adverb by an adverbial sentence, a participle by a subordinate clause, an infinitive by a noun, and so on. The plan, which is substantially that of Dr. Abbott's *How to Parse*, is an excellent one, and is fully carried out with a very large stock of examples. Moreover, the book is so arranged that technical terms may be used or dropped at pleasure. It would add to the interest of the book if in some of the exercises detached sentences were replaced by short stories or continuous passages slightly altered. It should be added that the author, who is English master in the grammar school at Aberdeen, has followed Prof. Bain's classification, and worked out the details according to the spirit of his teaching.

A New English Grammar of School-Grammars, by C. Daxbury, Second Edition (W. Stewart and Co.), has, in spite of its pretentious title, but little to distinguish it from old-fashioned school grammars.

The Children's Treasury of English Song, Parts I. and II., by F. T. Palgrave (Macmillan), deserves to be to the younger generation what the *Golden Treasury* of the accomplished editor has been to many of their seniors. While not neglecting old favourites like "Casabianca" or "John Gilpin," it is rich in poems of Blake and Wordsworth that have not yet found their way into school-books; and, like the *Golden Treasury*, contains some extracts that will be new to most readers. One or two spirited pieces by Sir F. Doyle are also a welcome addition.

Grammar Land, by M. L. Nesbitt (Houlston and Sons), will no doubt be popular in Schoolroomshire. The parts of speech have to appear before Judge Grammar and his assessors, Dr. Syntax and Serjeant Parsing, and establish their title to the words they claim. Mr. Adjective, for example, is accused of stealing the first part of words like *beautiful*, *manly*, and so on, and retorts that rich Mr. Noun is equally guilty in appropriating *happiness*, *brightness*, and the like. No sooner is this dispute settled than Mr. Adjective begins a fresh quarrel with Mr. Pronoun, the devoted adherent of Mr. Noun. In this way the book runs on, and though perhaps children will hardly understand it at first, they will like the story well enough to return to it, and gradually pick up a good many ideas. The illustrations are quite worthy of the text.

We have before us several sets of reading books for primary schools. Messrs. Philips' *Series of Reading Books*, edited by the Rev. J. G. Cromwell (Philip and Son), consists of a primer, six graduated readers containing both prose and poetry, and a poetical reader. The earlier volumes go upon the principle, now established in the best English and German schools, that reading and writing should be taught simultaneously. The task of selection, by no means an easy one, is well performed, and has been much facilitated by the permission to print many passages from copyright works. When we get to the sixth and last reading book of the series, we confess to a misgiving which, we fancy, must have struck the editor too. Is not something more continuous wanted, such as Miss Yonge's *Cameos*, or the biographies of English statesmen and warriors now being prepared under Mr. Creighton's supervision? In the poetical volume we should suggest fuller notes, especially to the extracts from Shakespeare. Macmillan's *Reading Books for the New Code* are also excellent, but much less full in the earlier parts; whether full enough we must leave to teachers to decide. The extracts are purely literary, not interspersed, as in Mr. Cromwell's books, with passages inculcating ventilation, economy of fuel, and the like. To speak generally, an effort has obviously been made to keep clear of the common-place. Among other

extracts we would especially notice two or three from *Tom Brown's School Days*, and one from a speech of Mr. Bright's on National Morality. The sixth volume is really a *Chrestomathie*, well-selected, and preceded by a short, sensible sketch of the history of English literature.

Chambers's National Reading Book, vols. iv. and v., New Edition (W. and R. Chambers), strikes us as containing too little poetry, and that hardly taking enough. As in the case of the books noticed above, the selection of the prose passages is very good. It may, however, be questioned whether the short treatises, of some ten pages each, on the principles of mechanics, electricity, &c., which are introduced here and there, will be of much use in themselves. Perhaps they may help a pupil to revise what he has been taught more in detail *viva voce*. *The Girls' Reading Book*, by Mrs. Henry Sandford (W. and R. Chambers), is intended to supplement the above, and contains chapters on domestic life and duties.

The Fifth English Reading Book, by T. Turner, F.S.S. (Simpkin, Marshall, and Co.), differs from most of its class, inasmuch as the prose extracts are for the most part original. They consist of lessons on simple ethical subjects, lives of scientific men, and a short history of England to the end of the Wars of the Roses. The history is, for a short sketch, remarkably free from unnecessary names and dates, and will be read with interest.

Friends in Fur and Feathers, and *Masterman Ready* (G. Bell and Sons), are two volumes of a series of strongly-bound and well-printed reading books, which is to include *Our Village*, Grimm's *Tales*, and so on.

The Phonic Method of teaching Reading and Writing, by G. C. Mast (C. Bean), is an application of the principle noticed in speaking of Canon Cromwell's reading books. Reading and writing are taught simultaneously, and the sounds of the letters, not their names, are used.

Eminent English Writers, by W. Lawson (Collins, Son, and Co.), contains biographies of the chief English writers. Though evidently compiled with care, it does not seem to accomplish the very difficult task of fixing perfectly in a student's mind the personality of an author, and his place in literary history.

We have also received *The Training Examiner*, by W. B. Morgan (Longmans), a collection of questions adapted to the more technical method of teaching English grammar, which is gradually being superseded by a more rational system; *Gray's Elegy*, &c., edited by T. D. Hall (Manchester: Galt and Co.), the notes to which are chiefly etymological, and seem to us too learned for children of an age to read the poems themselves with advantage; *Shakespeare's Henry VIII.*, edited by W. Lawson (Collins), not a very scholarly edition.

NOTES AND NEWS.

THE death of Mrs. E. T. Esdaile should not pass without record in a literary journal. This lady was Ianthe Eliza Shelley, the firstborn of all Shelley's children. She died on June 16, at Clifton, being just sixty-three years of age. The poet had six children altogether; Ianthe and Charles by his first wife, Harriett Westbrook; William, Clara, Percy (the present baronet), and an infant who died very early, by his second wife, Mary Godwin. Save the eldest and the youngest, Ianthe and Percy, none of them reached adolescence; and now Percy alone remains. The Shelley family have hitherto professed reticence with regard to some passages in Shelley's life—the time for a full disclosure was "not yet come;" perhaps, as the representatives of his race diminish in number, the time approaches. But no right-feeling person would urge unseemly

haste, distasteful to survivors. Ianthe was, of course, one of the two children of his first marriage taken away from Shelley's custody in 1817 by decree of the Court of Chancery; she was then four years of age, was educated under the superintendence of a clergyman of the Church of England, and grew to womanhood, and even to advanced age, we believe, in almost total ignorance of her father's doings, personal and poetical. While the civilised world has become, as it were, a chamber irradiated by Shelley's sun-like genius, the one darkest corner of it to which no beam reached was occupied by his daughter.

THE *Glasgow News* of June 21 gives the following particulars with regard to the forthcoming meeting of the British Association at Glasgow:—

"On Tuesday, a meeting of the Executive Committee entrusted with the arrangements for the visit of the British Association to Glasgow in September took place in the City Chambers. The minutes of the various committees were read and approved. The total sum subscribed to the guarantee fund is now £6,559. 10s. The Museum Committee, consisting of the three divisions—geology, botany, and archaeology—have arranged as follows:—The Geological Exhibition will be accommodated in the Corporation Galleries, the Botanical in the Lower Queen's Rooms, and the Archaeological in the University. Those exhibitions will be large and complete, and arrangements have been made for keeping them open, if desired, for some time after the meeting of the Association. The Local Industries Committee has three sub-committees on machinery, chemicals, and textile fabrics, and the materials for a highly-instructive exhibition are being collected. The exhibition will be held in the Kelvingrove Museum, where there is already a general collection of considerable size and variety.

"Arrangements have been made with all the leading railway companies in England and Scotland to offer facilities to strangers in coming to Glasgow, as also in any tours they may make before leaving the city. A guide and handbook is being prepared, under the general editorship of Dr. Blackie, and will contain notices of the various subjects of interest connected with Glasgow and the west of Scotland. For the meetings of the Association there has been secured the University, in which all the sections except the Geological and Ethnological (Section E) will meet. Section E will meet in the large upper hall of the Queen's Rooms. At the University, reception and refreshment rooms are to be provided. In addition to these premises, the City Hall and the Botanic Gardens Palace have been secured for the use of the Association. It is further proposed to have a concert by the Choral Union on Wednesday, September 14. The meetings begin on the 6th of that month."

THE discovery by M. Albert Ménard is announced of two manuscripts of Bossuet, consisting of notes on Juvenal and Persius. They appear not to be wholly written by Bossuet's own hand, but to contain autograph corrections by him, and the style of the text is said to bear the unmistakable mark of the genius of the Bishop of Meaux.

M. MOLINIER, who is preparing a complete edition of Pascal for Messrs. Lemerre's Collection, has found two small theological treatises by the famous Jansenist.

M. AUGUSTE LONGNON is about to publish a work on Villon, in which he reveals the crime, hitherto unknown, for which he was condemned to death. He gives the precise text of the trial of his accomplices. Villon was affiliated to a band of robbers which had rifled the College of Navarre at Paris, and also carried its enterprises into the country. This discovery, combined with those previously made by M. Longnon with regard to Villon's companions, finally clears up the hitherto obscure biography of the first of the French fifteenth-century poets. M. Longnon is engaged on an edition of his works.

THE sitting of the French Academy on Thursday, June 22, was most brilliant. The *éloge* of M. de Rémusat by M. Jules Simon was remarkable for its eloquence and literary power, and contrasted honourably with the monotonous dis-

courses which for some time appear to have been the rule at the Academy.

THE number of the *Revue Historique* for July 1 contains: "F. Hotman, from his Unpublished Correspondence," by A. Dareste; "The Fronde in Provence," by P. Gaffarel; "Guibert de Nogent," by C. Thurot; "The Jewish War under Adrian," by E. Renan; "The *Homo Romanus* in the Frank laws," by J. Havet; "Note on a MS. of the Capitularies," by M. Thévenin; "Recent Publications relating to Michel Angelo," by C. Paoli; "Unpublished Fragments of Roman History," by Michelet; &c., &c.

AMONG the Greeks and Romans it appears to have been a common practice to stamp with a name or device the leaden sling-bolts for use in war, and in doing so the Greeks in particular often gave way to a grim sort of humour, stamping on their bolts such expressions as "Take this," or "I see you." Of these Greek sling-bolts a considerable collection may be seen in the second vase room of the British Museum. Roman bolts are very scarce in that collection. But, in remarkable contrast with the poverty of our national museum in this respect, it appears that the Berlin Museum has been invited to purchase a series of inscribed Roman bolts, numbering 1,396 specimens, all found in the neighbourhood of Ascoli (Asculum), and collected, it would seem, by a Count Arpini, of that district, after whose death they were sent to Paris for sale. A number of the inscriptions on them were published by M. Desjardins, whereupon M. Bergh declared them to be forgeries. Meantime a set of 609 of these bolts had been sent to Berlin for purchase, and, though the authorities in Paris were convinced of the genuineness of these objects, it was thought necessary to meet Bergh's charge by a thorough examination of them one by one. For this M. Zangemeister, of Heidelberg, was employed, and the conclusion he came to, as communicated to the Academy of Science in Berlin, July 5, 1875, was that Bergh's suspicions were in a great part due to the incorrect and imaginary readings of the inscriptions by M. Desjardins, Bergh not having seen the objects themselves; and that, though there were many problems which he could not solve among the inscriptions, there was yet no satisfactory reason for suspecting forgery. Thereafter a second set of 787 bolts, being part of the same collection at Ascoli, was sent from Paris to Berlin for sale, and was again subjected to the minute examination of Zangemeister, but this time with the result of convincing him that many of them were forgeries, and of creating a strong suspicion that many more were possibly modern productions, a suspicion which also attached itself now to the specimens of the former set which he had been unable to explain at the time. The grounds of this suspicion he communicated to the Academy of Berlin, January 31, 1876. Since then M. Longpérier, whose judgment in questions of antiquity *versus* forgery is held very high, has given his opinion that the collection is genuine, and M. Desjardins has lately maintained his view to the same effect before the Académie des Inscriptions of Paris, as reported in the *Temps*, June 12, where it is gently stated that the Berlin authorities, having been so completely deceived by the Moabite forgeries, now have their suspicions in a highly strung state of excitement. No material takes on the appearance of age so readily as lead.

THE *Schweizerische Kunstverein* celebrated its seventieth anniversary on June 11, at Zolingen. The delegates from the different cantonal sections came to a unanimous resolution to take in hand, with the concurrence of the canton of Uri, the restoration of the famous chapel on the Tellsplatte, which has been so long in a disgraceful condition, the frescoes being half obliterated by the countless names of tourists of all nations which are written or scratched upon their surface. Even the altar and its ornaments have not been spared from this barbarous handling.

EDUARD SIEVERS's short essay, *Der Heliand und die Angelsächsische Genesis* (Halle), is of the highest interest to all students of the oldest English poetry. It is well known that the authorship of the poem—or rather collection of poems—commonly ascribed to Caedmon is very dubious. Indeed, the contrast between the splendid poetry of the narrative of the fall of the rebellious angels (which was, beyond a doubt, the direct source of Milton's inspiration) and the dull prosiness of the rest of the *Genesis* is so glaring as to make it highly probable that they are by different poets. Sievers's explanation is that the narrative of the fall and temptation is nothing but an Anglo-Saxon translation of an Old-Saxon original, which he supposes, with great probability, to have formed part of a paraphrase of the Old Testament, composed by the unknown author of the *Heliand*. The Latin preface to the *Heliand* states distinctly that such a paraphrase of the Old Testament was made by the author of the *Heliand*. The argument is based chiefly on the extraordinary resemblance between the language and style of the *Heliand* and that of the supposed Caedmon passage, which contains many words and phrases which occur nowhere else in the Anglo-Saxon poetry, but are common in the *Heliand*. Such a word as *wær* (true), evidently preserved only on account of the alliteration, which would have been sacrificed by the substitution of the genuine English *sōð*, is alone enough to prove the Germanic origin of the whole passage, *wær* being the regular Old-Saxon equivalent for *sōð*. Other Old-Saxonisms are *geýngorscipe*, *geýngordim*, *strið*, *hearnscearu*, &c. These conclusions, unwelcome as they will be to English scholars, must be accepted, although they deprive English poetry of what has hitherto been considered one of its noblest productions, and oblige us to fall back on the fragment preserved in Alfred's *Bede* as the only authentic remains of Caedmon's poetry we possess.

In a pamphlet *Ueber den Ursprung des Lingakultus in Indien* (Triebner and Co.), the Rev. F. Kittel, of the Basel Missionary Society, maintains in opposition to Dr. Muir and others that "Lingaworship" formed no part of the Dravidian religion before the influence of Brahminism in South India; but that, on the contrary, it arose among the Saivites, north of the Vindhya mountains, and is entirely, so far as regards India, of Aryan origin. The first of these propositions is fairly established; as to the second most readers may still have doubts, and the suggestion (pp. 46-7) that Linga-worship came from the Greeks seems almost entirely without foundation. But the argument is conducted throughout in a scholarly spirit, and throws much light on the history of this curious form of religious belief, which has played so predominant a part in post-Buddhist Hinduism, especially, but by no means exclusively, in South India.

M. THUREAU DANGIN has just published with Messrs. Plon a volume entitled *Les Libéraux sous la Restauration*, which, in combination with his previous book *Royalistes et Républicains*, forms the most complete and impartial work in existence on the political history of the Restoration.

WE have received *An Introductory Hebrew Grammar*, by A. B. Davidson, second edition (Edinburgh: T. and T. Clark); *The Argonaut*, edited by George Gladstone (Hodder and Stoughton); *An Account of the Proceedings at Keble College on St. Mark's Day, 1876* (Parker); *Lectures delivered at St. Margaret's Lothbury*, by the late Canon Melvill, new edition (Rivingtons); *Horses and Harness*, by E. F. Flower (Ridgway); *Church Innovations*, by the Rev. W. F. Hobson (Pickering); *Union or Dismemberment of Turkey*, by Stefanos Xenos (Wertheimer, Lea, and Co.); *Staat oder Papst?* hrsg. v. Arnold Ruge (Elberfeld: Loll); *Ueber Zweck und Mittel der Germanischen Rechtsgeschichte*, von Dr. K. v. Amira (München: Ackermann); *Die hundertjährige Re-*

publik, von John H. Becker (Augsburg: Lampart); *Truth in Extremis: a Plea against the Murder of Science by the Gold-poison*, by a Searcher (Oxford: Slatter & Rose); *Religiös-philosophische Zeitfragen in zusammenhängenden Aufsätzen besprochen*, von Dr. M. Joël (Breslau: Franck); *The Vicar of Morwenstow*, by S. Baring-Gould, new and revised edition (Henry S. King & Co.).

NOTES OF TRAVEL.

THE June number of *Petermann's Mittheilungen* contains an important contribution to Arctic geography, in the finished map and description of Franz-Josef Land, discovered by the second Austro-Hungarian Polar Expedition in 1873, after a year of weary drifting in the ice. Hitherto only an outline sketch of these discoveries had been published; this one is based on the final results of the working out of Lieutenant Payer's barometric observations for elevation. The land, as far as it has been seen, may be compared to Spitzbergen in extent, and comprises several large groups of islands. Wilczek-land is the largest eastern, Zichy-land the western mass. The broad Austria Sound divides these masses longitudinally, bifurcating in the north, in $81^{\circ} 40'$, at Prince Rudolf Land, where it throws off the north-easterly arm to which the name of Rawlinson Sound has been given. In contrast with the less severely Arctic character of Spitzbergen and Novaia Zemlia, Franz-Josef Land exhibits the full rigour of the high polar latitudes. In the beginning of spring, especially, all nature appears the most lifeless and frozen. Everywhere vast glacier curtains hang down from the higher snow-wastes of the mountains, the buttresses of which rise in bold crags and peaks. Everything is then covered up in blinding whiteness, even the steepest rock-walls being covered with ice. It is known that north-east Greenland, Novaia Zemlia, and northern Siberia give indications of a slow process of rising from the sea; it was, therefore, very interesting to the voyagers to observe proofs of elevation on the coasts of Austria Sound, in well-marked drift-terraces surrounding the shores in hypsometric curves. The vegetation proved to be very scanty, and far beneath that of Greenland or Spitzbergen in scale. The land is quite uninhabited and is without a trace of former occupation by man: the southern portion is also without animal life, excepting a few bears and passing birds; but to northward of 81° the snow was found to be crossed by many tracks of the fox, numbers of seals lay on the ice, and the cliffs were covered with thousands of sea-birds. The results of Lieutenant Weyprecht's meteorological observations during the voyage conclude this article. Another paper is given to Dr. Oscar Loew's interesting discoveries in the region of New Mexico, which formed the original seat of the Aztecs; the substance of this has, however, already been published in Lieutenant Wheeler's report to the Chief of Engineers, U.S., for 1875. The concluding part of Dr. Couto de Magalhães' diary while descending the river Araguaya to the Tocantins is also given.

ACCORDING to the *Turkestan News* the occupation of the Khanat of Kokand by the Russians and the pacification of the country, which had been so long a prey to bloody factions, are already producing beneficial results. The people are returning to their peaceful avocations, and the early spring has not been lost for agricultural pursuits. The coldness of the past winter and the quantity of snow-water on the mountains give promise of

an abundant harvest, circumstances which will aid the population to recover from the destitution to which they had been reduced by such adventurers and fanatics as Pulad-Beg, Abdur-Rahman Aftabeji (holder of the washing-can) and others. The latter years of Hudoyar's reign were extremely oppressive to the merchants as well as to the people, owing to the exorbitant taxation levied by him. As soon as the Russians had occupied the Ferghana valley, a reaction set in, and full liberty was given to agriculture and the arts of peace. In the interim, before a regular system of taxation can be organised, a *ziaket* commission holds its sittings in the town of Kokand, the members of the administration being for the most part chosen from the most trustworthy of the natives. Upon the occupation of this town by the Russians, the remains of the archives which had escaped the Kipchaks were found in the Khan's palace. These consist of rolls of paper some hundreds of feet long, containing information on the collection and assessment of the poll-tax and land-tax in different parts of the Khanat, together with the extent of arable land. Nearly a thousand of these rolls have been collected, the oldest of which date only ten years back, and it is anticipated that they will be useful in the future organisation of the country.

WE have received from Messrs. Cassell the fourth and concluding volume of Dr. Robert Brown's work on "*The Races of Mankind*," being a Popular Description of the Characteristics, Manners, and Customs of the Principal Varieties of the Human Family." This section is devoted to the Asiatic races, the aborigines of India, the Hindoos and Singhalese, the Mongolian family, the Chinese and Turanians. Pretending to be nothing more than a popularly descriptive account of the habits, customs, and religious observances of some of the chief families of the human race, the work carries out this intention admirably. It is perfectly free from the technicalities of a purely ethnological treatise, conveying information in the most pleasant and lively form, yet with strictly critical accuracy, and combines Dr. Brown's widely-gathered knowledge of men and manners with the results of search through a host of authors. The book is richly illustrated with about 130 fine wood-engravings, and even if we are right in thinking that we have seen a good many of these before, they are none the less appropriate here. In an appendix Dr. Brown touches again upon some of those tribes towards whom recent events have directed public interest, and in regard to whom newer information has been obtained; especially the Eskimo, on whose history Dr. Rink's recent work has thrown so much light, the Fiji Islanders, and the people of New Guinea.

FOREIGN REVIEWS OF ENGLISH BOOKS.

THE EDITOR will be greatly obliged if the Publishers of foreign Journals will send him copies of those numbers which contain Reviews of English Books.

CHILDERS, R. C. A Dictionary of the Pali Language. (Trübner.) *Jenaer Literaturzeitung*, June 24. By E. W. A. Kuhn.

 WRIGHT, T. The Celt, the Roman, and the Saxon, 3rd edition. (Trübner.) *Literarisches Centralblatt*, June 10.

PANZANI AT THE COURT OF CHARLES I.

AMONG the causes which led to the Puritan Revolution, one of the most conspicuous was the suspicion, widely entertained, that there was a conspiracy on foot at Court to bring the Church of England again under subjection to the Pope. Hitherto, with the exception of a Report which has found its way to England among the copies of Con's despatches, the only accessible information

upon the facts which gave rise to this suspicion has been contained in the *Memoirs of Panzani*, published by Berington early in this century. Memoirs however, at the best, can only be received with hesitation, and in this case it is probable that the work was drawn up by some second person from Panzani's papers. It is, therefore, with the greatest satisfaction that every student of history will learn that transcripts of Panzani's own despatches have recently been made by the Rev. Joseph Stevenson from the originals in the Vatican, and that they are now deposited in the Public Record Office.

The result of an examination of these papers has been to confirm the trustworthiness of the *Memoirs*, while, as might be expected, many details are brought to light which the *Memoirs* left unnoticed. The progress of the intrigue for the reunion can be clearly traced from week to week. Laud stands entirely free from all share in the matter, and Juxon, with whom Panzani sought an interview, politely declined to see him. The three men who were foremost on the English side in forwarding the scheme were Windebank, Cottington, and Bishop Mountagu of *Appello Cæsarem* celebrity. The characters of the three men stand as distinctly before us as they do in history. Windebank, if he does not obtain our respect, at least has a claim upon our pity. We watch him without clearness of ideas or firmness of principle drifting aimlessly towards the gulf which is to swallow him in the end. He sighs for unity of doctrine, for authority to silence self-opinionated and noisy talkers, for quiet in Church and State, which will make Puritans less troublesome to govern. But he has not quite thrown off the influences of his old English teaching, and he tries hard to persuade Panzani and himself that it is possible to induce the Church of Rome to make one step forward if he will make nine to meet it. Of course it is not possible, and he has to make the ten steps himself at last. In the mean time his struggles are sad enough. "It it were not for the Jesuits and the Puritans," he said to Panzani, almost at the beginning of their intercourse, "perhaps we might come to terms with Rome." The terms which he proposed were, as we have already learned from the memoirs, communion in both kinds, the Mass in English, and a married clergy. "Oh, the great judgments of God," he said on another occasion—

"who always punishes through those means by which the offence came. That pig of a Henry VIII. (*quel porc d' Enrico VIII.*) committed so many sacrileges, and profaned so many benefices, in order to give those estates to persons who having received them from the Crown might, as members of the House of Commons, assure it always for the king; and now the king's greatest enemies are those who have been enriched by these benefices."

At another time other feelings prevailed. "It is very difficult," he said, to leave the religion in which one is born. If only," he murmured, "there were a little charity in Rome."

Cottington is far away from all these agitations of the distressed conscience. He has a clear idea that it would not be a prudent thing to die a Protestant. But he has no idea that it mattered much how he lived. This, indeed, seems to have been a prevalent state of mind among the English nobility. Panzani notices with reprobation the frequent practice of keeping a priest in the house of nominal Protestants, in order that he might come to effect the needful reconciliation in the hour of death. A conspicuous instance was Lord Treasurer Portland. Till the last Panzani did not know of what religion—if the word may be so prostituted—the leading Minister was. When all was over, the dead man's physician hurried to the emissary of the Pope and whispered in his ear that he might pray for his soul.

Bishop Mountagu approached the subject of reunion with Rome with more decision. He was quite ready to accept the Pope's jurisdiction and

doctrine, though Panzani was of opinion that when these doctrines came to be discussed in detail difficulties would arise for which he had not provided.

In the background of all this the figure of Charles is constantly appearing, handling the idea of reunion as a possibility, but doing nothing to realise it, and of course meaning by a reunion an arrangement by which the Pope should come to him, and not he to the Pope.

On the whole, the impression produced by these despatches is that, though nothing serious was intended by Charles, there was quite enough to create alarm. Large numbers of persons about the Court were tending to a change of religion, or had secretly adopted a religion at variance with their public profession. The young Prince was taken by his mother to her chapel, and learned, as a child easily would learn, to admire the lights and splendour of the ceremonial. The few conversions which were afterwards announced would have been of little moment if the nation had had its destinies in its own hands. They caused not unreasonable alarm at a time when it was inculcated that the religion of the people was to be settled by the Government and not by the people themselves.

SAMUEL R. GARDINER.

PARIS LETTER.

Paris: June 26, 1876.

The surest sign of the decline of literature, properly so-called, in France is the sensation the posthumous works of men of the generation of 1830 create now when they are published. A few weeks ago Ste.-Beuve's *Chroniques Parisiennes* were the event of the day; now the *Lettres de M. Doudan* (2 vols., Lévy) are being universally read and admired as masterpieces of graceful style and delicate judgment. Had these books made their appearance between 1830 and 1840, when G. Sand and Palzac were publishing their novels, when Aug. Thierry and Guizot were recording the history of the Merovingian times, or analysing the civilisation of ancient France, when Hugo, Lamartine, Villain, Cousin, Thiers, Mignet were in the prime of their youth and talent, they would, no doubt, hardly have received more than a few moments' attention. But men of letters are few now; we have writers of scientific books and learned books, and these are often ably written, but letters are not cultivated now for their own sake, for the mere pleasure of couching fine thoughts in fine language; and when we come across some waif of the grand literary epoch which has just come to a close, we are both charmed and surprised as by some unexpected and extraordinary discovery. M. Doudan, as M. Silvestre de Sacy tells us in his preface—which preface also would seem to have been written at that distant period when the worship of letters was the ruling passion of distinguished intellects—was St.-Marc Girardin's as also his own (M. de Sacy's) companion in study. Appointed tutor to the son of the Duc de Broglie, he remained in the family of which he had temporarily become a member as private secretary and friend. From that time forward he formed one of the household somewhat after the fashion of those Abbés of the eighteenth century who held intellectual office in the houses of the great lords. In this position he dispensed his intellectual activity in light and brilliant conversation; he was bound to read and know and have an opinion upon everything, so as to be a species of daily chronicle and walking newspaper to his hosts, and the most competent and refined member of the whole party. With the exception of two or three articles inserted in the first of the above-mentioned volumes, M. Doudan's correspondence was the most solid literary work he ever achieved. Upon it he bestowed the utmost pains, even to the verge of affectation. His letters give one the impression of having been written, not

merely to satisfy the requirements of friendship or for purposes of intellectual intercourse, but as slowly-elaborated compositions, intended to be read in society, jealously preserved, and possibly one day published, as they now, in fact, have been. And they deserved it. M. Doudan was not a great intellectual light; the lofty problems of philosophy, the strong emotions stirred by social questions, the sublime flights of poetry, were not in his line. He is moderate and temperate in all things; has exquisite but rather narrow taste, and the scepticism appertaining to good company which made him able to live with devout persons without scandalising them, yet without at the same time being himself disturbed by their ways and their superstitions: above all he is witty, judging every thing with a shrewdness which amounts at times to depth, but wearisome by dint of trying to be witty, of affecting to make jokes in the midst of the greatest public misfortunes. These misfortunes still further narrowed a mind which by nature was neither large nor sympathetic. After the Commune the reactionary sentiments of a *bourgeois* beside himself with fright begin to come out in the old Liberal and sceptic of Louis Philippe's times. These letters, dating from 1827 to 1872, addressed, all of them, to very distinguished people (to mention only M. Guizot, M. and Mme. d'Haussonville, M. A. de Broglie, M. Raulin, &c.), form a most curious document for the study of the moral and literary history of the nineteenth century.

Another book introduced to us as the posthumous work of one of the great writers of the first half of the century is *L'Histoire d'Angleterre: racontée à mes Petits Enfants*, by M. Guizot, compiled by Mme. de Witt (Hachette). Unfortunately, there is more of Mme. de Witt in it than of M. Guizot; we do not feel the lion's claw. As the work of a distinguished painstaking woman this History of England is most estimable, but, regarded in the light of a posthumous work of M. Guizot's, it is worthless, and we are sorry that the great sale of his History of France should have led to the publication of the above, which will in no way add to the great historian's renown. We are afraid it will be very severely criticised in England.

A historical work of far greater value, at present in course of preparation, is *L'Histoire de la Formation territoriale des Etats de l'Europe centrale* (Hachette), by M. Himly. M. Himly is Professor at the Faculty of Letters in Paris, and, to the great regret of all who are acquainted with his profound learning and rare talent for exposition, had written nothing since his *Wala et Louis Débonnaire*. The work he is now about to publish is both historical and geographical: interesting, moreover, from a political point of view in face of the serious questions which are now agitating Central Europe.

L'Histoire de Florence, down to the time of Dante, by M. Perrens, the most important work the history of the famous Republic has ever yet given rise to, will also be published at Hachette's. The author has not merely condensed and summed up in his book all the works of detail hitherto existing on the subject, but furnishes us with a number of new documents, with original views, based on a thorough knowledge of the texts; and, lastly, with a very striking picture of Florentine life in the twelfth, thirteenth, and fourteenth centuries. The same publishers are to bring out the fifth volume of M. Duruy's *Histoire Romaine*, which carries us down to the end of the Antonines. It treats of institutions, studies, and manners, and passes in review successively the State, the City, and the Family. This likewise will be a comprehensive work on a subject never yet treated with such fullness of detail. M. Duruy, formerly Minister of the Empire, instead of endeavouring to console himself for the disappointments of politics by fruitless and unprincipled intrigue, betook himself with a dignity universally admired to soli-

tude and hard work. He returned to his *Histoire Romaine*, which had been unfinished for years, and he has been rewarded; the last volumes are far superior to the first in the eyes of all competent judges, on account of the solid scientific basis on which they rest, and their literary merit of form.

Besides this fine work, embracing the general history of all the Antonines, M. C. de la Berge, attached to the medal room of the Bibliothèque Nationale, is going to present us with a special study on one of them in the shape of a monograph entitled *Trajan*. By the help of archaeology and epigraphy, light is thrown on the unfortunately few historical texts of that date, and M. de la Berge's work will, we think, serve as a model of what works on the Empire should be.

The second volume of M. Aubé's *Histoire des Persécutions* is also forthcoming (Didier). Although his studies are conducted in a literary rather than a scientific spirit, and his scepticism takes, perhaps, rather too exaggerated a form, his researches are most interesting, and the second volume, in which he has endeavoured to reconstruct the leading features of the polemics of the Pagans and the Christians, promises to be worthy of the first.

One other publication belonging to this same epoch of the Antonines remains to be noticed—M. Barthélemy St.-Hilaire's admirable *Traduction de Marc Aurèle* (Germer-Baillière), furnished with philosophical notes, which form a kind of continuous commentary to the text, and such we might have expected from the translator and commentator of Aristotle.

The firm of Germer-Baillière has for some time past been the centre of the whole French philosophical movement; we might, indeed, add of the foreign likewise, for there is not a single important work, English or German, published but it shortly appears here in the form of a translation, and by this means Mill, Bain, Spencer, Hartmann, Lotze, are as widely diffused in France as are her national works. The representatives of all the schools jostle each other in friendly companionship at M. Baillière's, from M. Levêque and M. Bouillier to Buchner and Littré. A very important work has just made its appearance in this eclectic company—*Les Causes Finales*, by M. P. Janet, the most solid and remarkable representative of the spiritualist school as it at present stands. We have already drawn attention to his sincerity and impartiality as displayed in philosophical discussion—qualities which his new book still further proves him to be possessed of. One by one, with admirable thoroughness, he investigates all the problems and difficulties raised by the question of final causes, the central question, if I may venture to say so, of philosophy. Is there an intelligent order in the world, and is the succession of phenomena determined by a goal towards which nature and humanity are tending? The whole of metaphysics is implicated in this single question. If we may be allowed to express an opinion on so serious a subject, we should say that in our opinion M. Janet has amply proved the first part of his thesis—namely, that there is a reason, a meaning, an end in nature—but has been less successful in proving his second point, that this reason and this end which exist in nature prove the working of a conscious and creative understanding. The last chapter, *L'Idée pure et l'Activité créatrice*, raises a host of objections at every step, and it seems to us that M. Janet often falls into the error of assimilating the divine action to the human, and of drawing arguments from essentially inaccurate comparisons. Whether this be so or not, M. Janet's book is a noble and powerful attempt, and one calculated to awaken numberless and most salutary meditations on the vast subject he has undertaken to treat.

In the field of pure literature we must mention the verses of two young poets who seem to have striven to earn a reputation by stirring up scandal. M. Richepin sings us the *Chanson des Gueux* (Librairie Illustrée). In order to give the

wretched creatures in town and country a voice, he echoes their sufferings, their simple or brutal joys, their violent desires, their savage passions. He even speaks their tongue, and writes several of his pieces in thieves' slang. The book displays considerable talent, wonderful knowledge in the art of verse-making, a brilliant imagination, real power; but produces, it must be owned, a painful and unhealthy impression, and that not so much on account of the coarseness and indecencies of which it is full, but because we are conscious throughout of a want of sincerity. The author does not feel the sufferings, the passions, the joys he sings of: as a *virtuoso* he works out the theme he had selected as a lettered man and an artist. Infinitely harder it is to weep real tears and utter real griefs. The true poet is stopped every moment in his work by the fear of overreaching his thought and the longing to give it full expression, whereas when the poem is merely an intellectual pastime or a freak of the imagination, the writer is not hindered by any such scruples, and the task is comparatively an easy one. M. Richepin gives the secret of his system in the lines addressed to Maurice Bouchor: a poet, he says, must scandalise and scare his readers, play the mountebank and the clown, if the crowd is to listen to him. As soon as a man is known he can afford to be serious and sincere. M. Richepin is in the first stage; let us hope that, when he reaches the second, his talent will not be found to have declined, and that he will show that his lyre can be attuned to higher themes than thieves, drunkards, beggars, incendiaries, and dissolute characters. Lamartine, when he began his poetical career with *Les Méditations*; Victor Hugo, when he published the *Odes et Ballades*, did not think it necessary to besmear the muse with lees that she might find favour in the eyes of the public; they clothed her in purple and gold. We prefer their plan. Moreover, some of M. Richepin's notes have in them a sound of envy and hatred, reminding us of all that was most brutal in the feelings which brought about and attended the movement of the Commune—memories and feelings, those, which it would have been better never to have re-awakened.

M. Bouchor, M. Richepin's friend, has reached the second stage. Last year he wrote the songs of a drunkard; this year in his *Poèmes de la Mer et de l'Amour* (Charpentier) he shows himself in a far nobler aspect. His spirit and vivacity are always delightful; his ease and freedom amount to contempt for the most ordinary laws of prosody; he has a fresh and brilliant imagination, but—as in M. Richepin's case—we are always inclined to doubt his sincerity. The drunkard of last year has become a dreamer, and grown sentimental. Which is the real man? You wore a mask then; what tells me that you show your real face now.

If you are in want of a pretty novel for the vacation, get *Un Coin du Monde* (Lévy); a slight production, but a charming little bit of psychology which reveals a woman's hand.

Those who wish, just now that G. Sand, our greatest novelist, has passed away, to form some idea of the value of French novel-literature will find a faithful and agreeable picture given of it in M. Marius Topin's new book, *Les Romanciers Contemporains*. He reviews all our novelists, and judges them with a wise discrimination, and, with a tendency towards over-indulgence, quotes some well-chosen passages from their works.

Since my last, the Academy has made its final choice. MM. Ch. Blanc and G. Boissier are the successful two. Some people would have preferred M. Fromentin to M. Blanc, but the literary world unanimously approves M. Boissier's nomination, and was only surprised that M. Arsène Houssaye, some of whose novels can hardly be mentioned in decent society, should have had eleven votes. The excuse the Academicians plead is that no doubt those who gave them had not read his novels.

CORRESPONDENCE.

A SONG BY BISHOP PERCY.

1 Chalcot Terrace, N.W.: June 26, 1876.

Will you allow me space to point out a mistake relating to the date of Bishop Percy's song, "O Nanny, wilt thou go with me," which has found its way into books of some authority? Miss L. M. Hawkins (the daughter of Sir John Hawkins) stated in her *Memoirs, Anecdotes, Facts, and Opinions*, 1824 (vol. i. p. 271), that it was Percy's "invitation to his charming wife, on her release from her twelve-months' confinement in the royal nursery in attendance on her charge, Prince Edward, the late Duke of Kent," and the Rev. John Pickford in his *Life of Percy* prefixed to the print of the folio MS. follows Miss Hawkins in this identification, but makes the additional mistake of fixing the date of Mrs. Percy's employment as nurse in 1771, when the Duke of Kent was really born in 1767. Any one who has read the song through will see the inappropriateness of its language to such an occasion—for instance, the address in the first stanza would be foolish in the extreme if written by a husband to a wife just returning to her own home and children. The fact is that the song was addressed by Percy to Miss Anne Gutteridge a short time before his marriage with that lady in 1759. That this is a correct statement of the matter can be proved by an examination of the sixth volume of Dodsley's *Collection of Poems*, published in 1758, where the poem occurs at page 233 as "A Song by T. P...cy."

Many attempts have been made to deprive Percy of the credit of his work. First of all it was Scotticised into "O Nanny, wilt thou gang with me," after which it was claimed as a Scotch song. This claim Burns stigmatised as "an impudent absurdity," but still the critics tried to depreciate Percy's originality. Stenhouse sup-

poses that he may have had in view the Scottish song inserted in Ramsay's *Tea-Table Miscellany*, entitled "The Young Laird and Edinburgh Kate," the second stanza of which commences:—

"O Katy, wiltu gang wi' me,
And leave the dinsome town awhile,"

and Charles Kirkpatrick Sharpe suggests that both the author of "The Young Laird and Edinburgh Kate" and Percy took their ideas from a song in Lee's tragedy of *Theodosius, or the Force of Love*, beginning:—

"Can'st thou, Marina, leave the world,
The world that is devotion's bane?"

The quoted stanzas of all these songs are somewhat alike, but the opening address of each is commonplace enough to have occurred to several minds. The real beauty of Percy's song, which consists in its picture of a wife's duties, is entirely his own.

HENRY B. WHEATLEY.

ON "DOUBLE" AND "JEWEL" IN "MIDSUMMER NIGHT'S DREAM," ACT IV. SC. I.

Northampton: June 21, 1876.

In the play of *Midsummer Night's Dream*, act iv. sc. 1, we find:—

"Demetrius. These things seem small and undistinguishable,

Like far off mountains turned into clouds.

Hermia. Methinks I see these things with parted eye,

When every thing seems DOUBLE.

Helena. So methinks,

And I have found Demetrius like a JEWEL,

Mine own, and not mine own."

On the above passage Warburton has observed (*Variorum*, v. 302, note):—

"Hermia had observed that things appeared double to her. Helena replies 'so methinks,' and then subjoins that Demetrius was like a *jewel*, her own and not her own. He is here then compared to something which had the property of appearing to be one thing when it was another, not the property sure of a jewel, or, if you will, of none but a false one."

Now, the perusal of the above note has led me to believe that the passage in question is an instance of the play upon words of which there are many instances in the works of our author, and that Helena, in the use of the word *jewel*, really says—"And I have found Demetrius like a 'double,'" which in the jewellery trade means "a counterfeit stone composed of two pieces of crystal, with a piece of foil between them, so that they have the same appearance as if the whole substance of the crystal were coloured."

Of course the use of the word in this sense would require the knowledge of an expert, and this Shakspeare had, as is evident from his frequent use of the word *foil*, one instance of which is sufficient—viz., *Richard III.*, act v. scene 3, line 250:—

"A base foul stone made precious by the foil."

The words "mine own and not mine own" seem to convey the idea that Helena seemed to regard Demetrius as her own when he was true to her, and not her own when he was false to her.

CHARLES BATTEN.

HARPSFIELD'S TREATISE ON THE DIVORCE.

Kendal: June 26, 1876.

Mr. Pocock, in his second notice of the above work, writes: "As regards Cardinal Pole's conduct at Paris in the matter of the divorce," "there is not a hint . . . in any historical work that he (Pole) had ever taken any active part for the king in collecting votes favourable to the divorce." Again, "Till the appearance of the *Records of the Reformation*" (which Mr. Pocock says was printed at Oxford in 1870) "no evidence to implicate Pole was producible."

Mr. Pocock is mistaken in these assertions. Mr. Froude (*History of England*, vol. i. pp.

275-7; 3rd ed., 1802) had already described the part taken by Pole at Paris, and had printed Pole's letter to the king. JOSEPH BROWN.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, July 1.—3 P.M. Mr. Walter Macfarren's Concert, St. James's Hall.
 MONDAY, July 3.—2 P.M. Royal Institution: General Monthly Meeting.
 4.30 P.M. Asiatic (at the South Kensington Museum): "Account of the Amravati Sculptures," by J. Ferguson.
 WEDNESDAY, July 5.—7 P.M. Entomological.
 FRIDAY, July 7.—4 P.M. Archaeological Institute.
 8 P.M. Geologists' Association.

SCIENCE.

A Glossary of the Lancashire Dialect. By J. H. Nodal and George Milner. Part I. Words from A to E inclusive. (London: Trübner & Co., 1875.)

PERHAPS there are few things so little understood by critics as the requirements and rules to be observed for the construction of a county glossary. It is one of those subjects on which theoretical reasoning throws very little light; and, whilst many imagine they can tell how such books "ought" to be written, only those who have a practical acquaintance with the subject can tell how they "can" be written. The wisest rules are of little use if they are impractical, and the study of glossaries that have been already made is really a safer guide than the most careful description of such as might, or should, or ought to have been made if the makers of them had gone to work on the highest scientific principles.

These remarks have been suggested by a notice of Mr. Parish's *Glossary of the Sussex Dialect* which appeared in the *Saturday Review* of January 1 in the present year. The writer seems to have been dissatisfied with some expressions in the Preface, and thence to have drawn conclusions that the whole book is not so good as it should have been; putting little distinction between the work itself and the introductory remarks which were, no doubt, written afterwards, and contain some expressions which can be controverted, if rigidly judged from an historical point of view. Omitting the consideration of these, which form no part of the present subject, the remarks upon the glossary itself are singularly at variance with the practical working rules laid down by the English Dialect Society as a basis of their labours. The glossary was condemned as being one of those "old-fashioned glossaries, the use of which is not easy to understand, in which a man undertakes to set down the dialectal peculiarities of a certain district, and then goes and puts down every word in that district which differs from high-polite book English, whether it is in any way characteristic of that particular district or not." Such condemnation is really the highest praise, if the matter be rightly considered, and it is precisely these "old-fashioned" glossaries that are of the highest value to the student of language, and the use of which it is very easy for some of us, at least, not only to understand, but to appreciate. The whole question is, of course, how is a list to be made?

On this point the writer kindly gave us the best help he was capable of; and his rules turn out to be just the very ones which critics have repeated before, almost *ad nau-*

seam, but to which no glossary-writer has ever paid the slightest attention in practice, though many of them have so far deceived themselves as to imagine that they were, to some extent, doing so. The right course, it seems, is to "sift" the collection, to see "what does and what does not illustrate the dialect of the district." The real answer to this is, that a little sifting may do good, and there certainly are words which our glossary-makers have inserted needlessly, and a little too often. But it should be done with a very gentle hand, and no sifting at all is infinitely preferable to too much of it. The notion of "sifting" rests ultimately on the fallacious notion that there are many words which are really peculiar to a county, and characteristic of a county. This is precisely the notion to which we are prepared to give an unqualified denial. No doubt such a fallacy has been assumed over and over again, since otherwise no county glossaries would ever have seen the light; but a little thought ought to dispel such an illusion for ever. The reason why glossarists have generally taken counties as the supposed basis of their operations is solely that it was practically convenient to do so. The county is a fairly definite name for a certain district of England; it is a sufficiently large area for a glossary to range over; and to say that such or such a word is used in Norfolk is to give a first rough approximation to its real locality. Beyond this, there is not, in general, any real virtue in the word. It may be the case that some counties are bounded, on some sides at least, by natural boundaries which are, to some extent, boundaries of speech, but very often this is not the case. If the areas of words were rigidly conterminous with counties, it would of course follow that, when a small portion of one county happens to be situate, as is the case, within another one, then the speech of that portion differs from the speech of the surrounding neighbourhood; which is a *reductio ad absurdum* of the county limit. The divisions of dialects and of counties are, of course, widely different. For example, Sternberg, in his excellent little work on the Dialect of Northamptonshire, brings out the most interesting fact that a clear line of demarcation of dialects runs right across the county. Whether the county division was the best that could have been imagined, is not now worth discussion. It has already been adopted by so many different writers that it is now too late in the day to dream of any other system. All that is at present required is that a good account of each county shall be rendered in due order.

We are therefore glad to welcome this latest addition to our stock of provincial glossaries; and the more so, as the county of Lancashire is one of great importance. We are not at all surprised to find the editors saying that "the further we have progressed in the work, the less reason have we seen for treating Lancashire on a plan at variance with that adopted in regard to other counties." The fact is, simply, that practice is a better guide than theory in this matter; and that if a critic wishes to ascertain how a glossary "ought" to be made, he has only to try and make one for

himself, and he will soon settle down into doing in practice almost all that his theories would forbid him to do. We are glad, moreover, to be able to say that the Lancashire Glossary does not materially differ in principle from the "old-fashioned" glossaries of former days, for the simple reason that it could not do so.

The chief argument of those who have really given but small attention to the subject is that there are, at any rate, *some* words used in one county, let us say Sussex, which are absolutely unused elsewhere. This is the same idea as before, but narrowed in extent; yet equally fallacious, and perhaps even more pernicious, because more specious. Speaking generally, we deny the supposition emphatically, and for a very good reason, viz., practical experience. Let any man who has made a list of county words follow the advice given by such as tell him to "sift" it. Let him do this, not tenderly and reasonably, but thoroughly and scientifically. Let him keep his list by him for several years (the only fair way), and strike out one by one every word which turns out to be known in Kent, or Hampshire, or (which is not at all improbable) in Lincolnshire, Cornwall, or even the Lowlands of Scotland. At the end of the time, the list will assume proportions so ridiculously diminutive as not be worth publishing; though this is the very process which is, we suppose, "new-fashioned" and "scientific." We have been informed, on good authority, that the experiment has been tried; that a list of some 200 words thus selected dwindled down, in two years, to only *two*; and that of these *one* stood the test, and, if we could learn what it was, and if it were worth while, we have no doubt that we could have found it elsewhere. We make bold to say that we will undertake to utterly demolish and annihilate any county-list that can be made, if allowed to use the "scientific" principle of marking out what we know to be, or to have lately been, current elsewhere. The whole notion is a dream, and a rather silly one.

Putting aside all unreasonable theories, let us rather consider what we *do* want. What we want, in reason, is pretty much what we find in the majority of the existing glossaries.

There is, besides, another consideration that should be adopted by reasonable students, viz., that all such work ought, on no account, to be judged by a very high standard of excellence. We do not want etymologies, as a rule, because they may err, and have erred; and they often give an awkward twist to the definition of the word; for when the etymology and the definition are at all at variance, it is the unlucky definition (which should be rigidly correct) that has to bow to the etymology (which is, in such cases, mostly wrong). We want a full, long, sufficient list of all the words that can be had that are at all out-of-the-way; good definitions of them; and, above all, good illustrations of their use. And those who know most of the matter will expect least in the way of "scientific" handling, which is not always to be had. Judging from a practical and reasonable point of view, we are very well satisfied with the Lancashire

Glossary; and can only say that if an equally good one were to be had of every county in England, we could *then* do what we cannot quite do now, and construct from such materials a *general* provincial glossary of all England, superior, perhaps, to any that now exists. At the same time we take leave to say that the more Halliwell's Dictionary is used, the more it improves upon acquaintance, and that we are very fortunate in having, in that work, so good a beginning.

We do not say that the Lancashire Glossary is faultless; it is, however, carefully executed, and may take its place beside the well-known glossaries of Atkinson, Forby, Miss Baker, Barnes, and the rest. No doubt constant use of it may suggest some alterations, corrections, and improvements, such as we hope the authors will give us in a supplement. In particular, there will very likely be a few words to add. In comparing it with an old glossary in *Tim Bobbin*, we find several words which might have been inserted, on the authority of *Tim Bobbin*; or, at any rate, we hope to be told, hereafter, what reasons there were for omitting them. If obsolete, they might have been marked as such; but some account is required of them. In the edition of 1818, we find, for example, *dawntle*, to fondle, *deceavely*, lovely, *doytch-backs*, fences, *durn*, that piece of wood or stone by which gates hang, all words which ought to be recorded somewhere; the more so, perhaps, because Bamford ignores them, with the exception of "*durn*, a gate-stump." We would suggest that a list of such words, which cannot perhaps be now recognised as in very common use, should appear, hereafter, in an Appendix. If there is no authority for them beyond that of *Tim Bobbin*, it would be easy to say so. The editors seem to have intended to insert all words found in previously existing dictionaries, but we could easily add several to their list.

The most valuable part of the work lies in the illustrations from books written in the dialect and from colloquial usage. The Preface tells us that "when not obtainable from books, an example is given, wherever practicable, of the current colloquial usage of the word." We heartily wish the editors would take into consideration the advisability of reversing their plan, and endeavour to give, in the first place, examples of the current colloquial usage, and examples from books only (or chiefly) where colloquial examples are not obtainable. The colloquialisms are far the best. Even among the quotations, we could well spare some of the examples from older English, if only we could have in their place more quotations from books of the present day. The glossary is, in the main, a glossary of the dialect as it now exists, and it is therefore obvious that modern examples should have the place of honour. If not given now, they can never well be supplied hereafter; whereas any one who possesses Stratmann's Dictionary and the Early English Text Society's publications can, at his leisure, find quotations for himself from our older authors. We trust this hint may not be lost sight of.

The work was originally intended to be published by the Manchester Literary Club only; but arrangements have been made by

which it has been published by that Club and the English Dialect Society conjointly. We congratulate that Society on this result, and trust that its members may appreciate this last addition to their materials. We think that, while the labours of the compilers of such works should not be judged of too rigidly, there is a great temptation to a critic to do so. Yet the labour of compiling them is much greater than might be supposed. They contain much information that is not to be had elsewhere. The very fact that a word is recorded in them often throws a new light on what may be called the *area* of a word; and it is by no means uninteresting to find that even some common words which a Londoner would put down as mere cockneyisms are in familiar use in valleys whither the sound of Bow Bells has never penetrated. All this, and more, we may learn if the "old-fashioned" ways be persisted in with sufficient perseverance, and the advice of the *Saturday Review*, in this particular instance, be sufficiently disregarded.

WALTER W. SKEAT.

Timber and Timber Trees, Native and Foreign.

By Thomas Laslett, Timber Inspector to the Admiralty. (London: Macmillan & Co., 1875.)

MR. LASLETT has had so much experience in the forests of widely distant parts of the world, and not only of the living trees, but also of timber under every conceivable condition, that the announcement of a work from his pen devoted to the consideration of Timber and Timber Trees naturally awakened great expectations. That his book perfectly realises some of the expectations formed regarding it is as certain as that in other particulars it falls short of what was looked for, and what should and might easily have been effected. But it would obviously be unfair to criticise a work because it does not embrace or treat so fully of certain branches of a subject as one might wish. The author set himself a certain task, and the question is, has he performed it reasonably well? In his preface he says:—

"A handy book on home and foreign timber, for ship and house-building purposes, is, in the opinion of many, much required. The botanical treatises which are accessible are too strictly scientific in their form and treatment to interest the general reader, and they lack that practical application of knowledge to the wants of the shipwright and carpenter which it is one of the aims of this book to give. Hence, I have endeavoured to concentrate into one form all the information which books and long experience could give, and so to arrange the materials as to make them intelligible and acceptable alike to the master builder and apprentice."

And further on he adds, "I am not without hope that the results will be of service to many who are engaged in carpentry, shipbuilding, and engineering."

From a practical point of view the author has doubtless succeeded, if not wholly, at least to a great extent, so far as present requirements are concerned. Moreover, the work embodies the results of a vast number of valuable experiments on the qualities and properties of different timbers; and it is of

high scientific as well as purely practical interest to have these on record. Indeed, the figures relating to weight, strength, &c., of timbers would alone be sufficient to entitle it to our commendation. The chapters on the defects found in trees, hints on the selection, felling, storing, and most economical working up of timber, are also satisfactory. But in this place it is our duty to examine its general merits, and we feel bound to say that its defects in scientific (botanical) details are so numerous and so glaring that the book is almost useless to the "general reader," whom Mr. Laslett seeks to instruct, and even misleading to those who possess little knowledge of the geographical distribution of plants and systematic botany.

It might have been supposed that the position of Inspector to the Admiralty offered great facilities for the identification of the best kinds of timbers with their botanical species, but in Mr. Laslett's book we find great confusion even in the nomenclature of well-known timbers. Unfortunately, there is a general tendency to underrate the importance of botanical studies; but sooner or later it will become necessary to ascertain the species which furnish the most valuable timbers, just as it has already in the case of many almost indispensable drugs, for the natural supply cannot be regarded as inexhaustible. Closely allied and very similar species are often of very unequal economic value. Mr. Laslett does not seem to have consulted trustworthy books for his botanical names, or to have drawn upon the resources of the fine national collection of woods at Kew, which would have afforded him much information. As an illustration of practical utility combined with scientific accuracy, we may mention Brandis's *Forest Flora of India*, and Flückiger and Hanbury's *Pharmacographia*. Of course, if Mr. Laslett had disregarded the botanical side of his subject altogether, he would not have laid himself open to criticism, and his book would certainly have been under the circumstances far more satisfactory as a whole.

The first chapter is devoted to the growth and structure of trees, and anything more vague and confused we have seldom read. In the succeeding chapter the age and rate of growth of trees come under consideration; and the fabulous age of five thousand years attributed to the Baobab of tropical Africa is repeated without any qualification. The table at pages 17 and 18 of the number of concentric circles, or annual layers of wood, in given diameters of stem, presents some extraordinary figures. Thus the average number of layers in ten English oak trees, four feet in diameter, is given as seventy-six; and one of the same diameter had only forty-nine rings! These trees, it is stated, were of magnificent growth and of the first quality. Passing to the chapter on the oak tree generically considered, we are treated to some very hazy remarks on distribution. Confining ourselves to those respecting English oaks, we find Mr. Laslett saying, "The botanical names of those which are indigenous to this country are the *Quercus Robur pedunculata*, the *Quercus Robur sessiliflora*, and the *Quercus*

pubescens, or Durmast oak." Now, so far as we know, or the works on British botany we have at hand inform us, the last does not exist, in a wild state at least, in this country. There is a *Quercus pubescens* found in the south of Switzerland, Austria, &c. *Q. sessiliflora* is sometimes called Durmast. Altogether the chapters on oaks are unsatisfactory in regard to nomenclature, though otherwise interesting and instructive. Chapter xxi. treats of Burmah woods, and the *Pyinkado* or iron-wood tree is said to be the *Ingazylocarva* of botanists; and this same name is twisted into *Juga xylocropha* a little further on. *Inga xylocarpa*, or *Xylia dolabriliformis*, as it is now called, is the tree intended. In the next chapter, African oak or teak is said to be the *Swietenia Senegalensis*; but we are under the impression that *Oldfieldia Africana* furnishes the timber in question. It is quite possible, however, that the former may be known in commerce under the same popular name. For instance, the different kinds of rosewood of commerce are furnished not only by *Triptolemaea* (not *Triptolomea*, as printed), but also by various species of *Dalbergia* and *Machaerium*.

The chapter on Australian timber is rather more satisfactory, though only six species are described in detail. This is followed by one on miscellaneous trees, in which it is stated that the beech, *Fagus sylvatica*, "is extensively spread over the middle and south of Europe, and varieties of this species are to be met with in America and Australia." The North American form may possibly be no more than a variety or race of the same species, but the Australian forms are evergreen species, with small thick leaves. We can readily suppose that this statement is due to a loose notion as to what constitutes a genus, species, or variety; and we believe that it is a fair illustration of the popular conception, but it is none the less misleading. On the same principle we are told that *Buzus sempervirens* "is also found in the West Indies;" and the thirty-second chapter is devoted to "Cedars." This heading includes the true cedars (*Coniferae*) and *Cedrela odorata*! Under the cedar of Lebanon it is stated that the rapid growth of the cedar tree is borne out by the careful examination of some logs brought from Honduras, which were found to exhibit a rate of growth showing that one inch of wood diameter was made in rather less than two years. This, of course, refers to the genus *Cedrela*, which is as different from *Cedrus* as a kangaroo is from an elephant. We might go on with these criticisms, but we have given sufficient proof of its scientific inaccuracy to show how faulty the book is in this respect. However, as already stated, this detracts little from its real value to the practical timber-merchant and engineer, so far as the different timbers in the market are concerned. We have only to add that it is surprising that no mention is made of the principal Indian timbers, such as the *Säl*, *Tün*, and *Sissoo*, because so much has been done of late towards the conservation and management of Indian forests.

W. B. HEMSLEY.

SCIENCE NOTES.

METEOROLOGY.

Meteorology of the Atlantic near the Equator.—Captain Toynbee read a paper on this subject before the British Association at Bristol last year, which has just been published by the Meteorological Committee. It is a summary of the work of the Meteorological Office for the region extending from 10° S. to 20° N., and from 10° to 40° W., the detailed materials for which are announced as in the press, in the form of monthly charts, tables and explanatory text. The present paper, however, is especially welcome, as it anticipates the larger publication and furnishes the reader in a handy pamphlet with the main results to which the general discussion has led. It is illustrated by a series of the actual monthly charts of prevailing winds, currents, &c., &c., which will form part of the complete work. The notice of each month occupies about two pages, so that the paper is far more convenient for consultation than the larger form of the detailed discussion. We should notice a very valuable appendix by Prof. Stokes on the observation of wave-motion in connexion with the rollers by which Ascension and St. Helena are occasionally visited. Captain Toynbee has shown, almost to demonstration, that these are produced by the winter northerly gales off the American coast.

The Value of the Aneroid.—Prof. Jelinek has published, in the *Sitzungsberichte* of the Vienna Academy, a valuable paper on "The Constants of the Aneroid, and on the Application of a Scale of Heights to the Instrument." He takes up the entire history of the aneroid experiments which have been made, and arrives at the result that the instrument is capable of rendering very good service, even for ordinary observations, if properly managed and protected against rough usage. As regards the use of a scale of heights he points out a consideration which is often forgotten by tourists, that the heights marked on the instrumental scale correspond to the *normal* conditions of pressure, and that if you want to know what the precise elevation has been for any given day on which an observation was made, it is necessary subsequently to consult a telegraphic weather-report in order to see what the difference was between the *observed* sea-level pressure at the place on the day in question and its *normal* value. The actual scale-indication should then be corrected accordingly. Prof. Jelinek in conclusion criticises Field's engineering aneroid, showing that the principles on which the temperature-correction is applied by him are inexact, and that consequently the instrument as constructed by him can only be used for very moderate elevations. The paper concludes with some very useful tables.

Barometrical Maxima.—In the *Austrian Journal* for May 1, Prof. Hann gives a very interesting discussion of the phenomena observed in Central Europe during the period of high pressure and intense cold which was experienced at the end of January. He shows that this was accompanied by relatively very high temperature at mountain stations, and that the cold was experienced in isolated valley basins which were covered with a layer of fog. The same phenomenon of an increase of temperature in a vertical direction during intense frost has frequently been noticed before, especially at Pike's Peak in April, 1874. It appears, therefore, that the severe cold below is regularly associated with abnormal warmth and dryness at the upper stations, so that the conditions are much the same as in the case of the Föhn. The elevation of temperature in the descending mass of air is produced by its descent, and as soon as the air has reached a certain level its downward motion is checked and is converted into a horizontal motion, when the temperature begins to fall, owing to radiation, until eventually it sinks very low close to the surface of the earth. The result clearly shows that the tempo-

rary increase of pressure at the earth's surface is not accompanied by a corresponding decrease of pressure above, and the local barometrical maxima are, according to Prof. Hann, dynamical phenomena, in contradistinction to the regular increase of pressure over continents in winter, which is attributable to thermal causes.

Winds of Spitzbergen.—In the *Austrian Journal* for May 15 we have an abstract of a paper by Dr. Wijkander, published in the *Öfversigten* of the Swedish Academy. He points out that the most remarkable phenomena of the storms in the Arctic seas is their irregularity, vessels on different sides of a large floe having different winds, all blowing hard, while inside there is calm. The Swedes at Polhem had few storms in spring, the Germans at Pendulum Island had as many as in winter, owing to the proximity of open water. The path of the storms was generally southerly, and one remarkable feature was the warmth and dryness of the southerly winds at Polhem, partly due to the fact that the air must have passed over the high land of Spitzbergen, and warmed itself in descending to the sea-level. The same circumstances are noticed with the warm south-east winds of Greenland.

Winds over the Atlantic.—M. Brault, whose new wind-charts were noticed in the *ACADEMY* for November 6, 1875, and January 1, 1876, has printed in a late number of the *Comptes Rendus* the conceptions as to atmospherical circulation to which he has been led by the consideration of 650,000 observations, and which naturally differ in some degree from those which Maury formed on the discussion of material only one-fifth as copious as that now available. M. Brault's views, in their main features, accord with modern ideas as to the relation between wind and the distribution of barometrical pressure. We have a diagram chart, drawn for the month July—September, which shows the immense anticyclonic whirl round the Azores, while M. Brault makes the Doldrums a central space whence the currents diverge, the eastern portions of both trade winds being diverted towards the African coast to form the West Monsoons of the Line, while the western portion flows on to the American continent. He appears to consider that the south-east trade does not pass the Line at all.

Periodicity of Hurricanes.—Vice-Admiral Fleuriot de Langle has published in the two last numbers of the *Revue Maritime et Coloniale* a long discussion on the periodicity of cyclones in all parts of the world. The paper seems to have been first read at the Geographical Conference in Paris last autumn. M. de Langle seeks to connect these storms directly with astronomical phenomena, as will be seen from the conclusions which he gives in the following sentences:—

"We may deduce from the preceding investigations that when the latitude of the place, the declination of the sun or the moon resume the same values respectively, and these phenomena coincide with an eclipse of the sun or the moon, or with a phase of the moon, on its approach to its apogee or perigee, there is danger of a hurricane. If at these critical periods there is any unsteadiness in the winds, extra caution is required when the apogee or perigee occurs near the time of full or new moon."

Of course, the statements are corroborated by a copious array of diagrams and tables, but after a careful study of the paper we fail to find that much has been added to our knowledge of the subject. There seems to be one radical defect in the reasoning, which influences all discussions of the relation between the moon and the weather. The hour of occurrence of a phenomenon at one station is taken, and the relation of that occurrence to the moon's age and position is investigated; but it is persistently ignored that the hurricane moves over the earth's surface, so that if its occurrence at A coincides with the period of any other phenomenon, it must necessarily fail to coincide with it at B.

Colliery Explosions and Weather.—Mr. W. Galloway has published, in No. 168 of the *Proceedings of the Royal Society*, a paper on the influence of coal-dust in producing explosions. It hardly falls within the scope of meteorology to follow out the whole of the reasoning; but the final result is of importance to our science. In dry mines there is constantly a quantity of dust in the workings, and if the atmosphere be exceptionally dry this dust will be the more likely to be blown about and so disseminated through the air-currents. Now, Mr. Galloway finds that the slightest trace of fire-damp is enough to render a dusty atmosphere explosive, and so if in a dry mine any small disturbance, like the blowing out of a shot, occurs, this may raise the dust and cause an explosion in parts of the workings which would otherwise have been perfectly safe. Mr. Galloway attributes many of the more extensive accidents to this cause, and considers that they are most frequent in cold weather, thirty-two out of forty-nine recorded being in the winter half-year. M. Vital, in France, has also paid attention to the same question. The remedy for this cause of explosion is, of course, watering the ways of the mine.

GEOLOGY.

ANOTHER Decade illustrating the organic remains of Victoria has been prepared by Professor McCoy, the Government Palaeontologist, and has recently been issued by the Geological Survey of the colony. As this is the third decade of the series, we are now in possession of thirty plates containing figures of some of the most interesting fossils yet known in Victoria. The original specimens here figured are deposited in the National Museum at Melbourne, an institution of which Professor McCoy is director. In the present decade the first plate illustrates an important specimen of Professor Owen's "Marsupial Lion" (*Thylacoele carnifera*). This curious animal has been the subject of much discussion, Professor Owen having assigned to it predaceous habits, while Professor Flower and the late Dr. Falconer have argued in favour of its having been a vegetarian. By abrupt transition we pass from this Tertiary mammal to some Silurian trilobites. Here it is curious to meet with our familiar *Phacops caudatus*, and it is yet more notable that the Victorian and the Welsh specimens are said to present exactly the same range of variations. The remainder of the decade is devoted to descriptions of Tertiary mollusca. Among these the most interesting is a new species of *Pleurotomaria*, from Upper Miocene deposits, described under the name of *P. tertiaria*. The genus was abundant in Oolitic times, and is represented, though feebly, in recent seas; yet we find scarcely any of its species continuing the succession through the Tertiary period.

In examining some fragmentary remains embedded in blocks of rock which had been obtained from the Karoo lacustrine deposits of South Africa, Prof. Owen has recently procured evidence of the existence in Triassic or Permian times of a carnivorous reptile, about the size of a lion, to which he has given the name of *Cynodraco major*. The material on which the evidence is based comprises the upper canine teeth, a part of the lower jaw with teeth, and the humerus or arm-bone. The teeth closely resemble those of the extinct feline animal known as the *Machairodus*, while the humerus presents characters hitherto known only in the class of mammals, and pre-eminently in the feline family; yet in certain other respects the bone is essentially reptilian. Prof. Owen proposes to form the extinct carnivorous saurians into a distinct order of reptiles to be denominated the *Theriodontia*. The paper, which is printed in the last number of the *Journal of the Geological Society*, concludes with some philosophical remarks on the relation of extinct reptiles to existing mammals.

At a recent meeting of the Academy of Natural Sciences at Philadelphia, Prof. Cope presented a synopsis of the vertebrate faunas of the Eocene rocks of New Mexico. He has also described the tarsometatarsus of a bird, which he discovered in these deposits. (One end of the bone suggests affinities with the *Cursores*, while the other extremity resembles that of the *Gastornis* of the Paris basin. The bone in question indicates a species having feet twice as large as those of the ostrich. From this discovery we learn that North America has not been destitute of the gigantic birds hitherto found chiefly in the faunas of the Southern Hemisphere.

UNDER the title of *The Ice Age in Britain*, Mr. Ralph Richardson has published an interesting pamphlet, setting forth views which were recently submitted to the Edinburgh Geological Society, of which the author is honorary secretary. Deep-sea soundings, such as those of the *Valorous*, show that the North Atlantic sea-bed between Britain and Greenland is comparatively shallow, and that a broad tract, stretching between the two places by way of the Faroes and Iceland, nowhere exceeds five hundred fathoms in depth. Mr. Richardson suggests that in the early part of the Glacial period the sea-bed was elevated to such an extent that land-communication was established between Northern Europe and the Arctic Regions. By such a junction the polar land-ice might gain access to Europe, while the course of the Gulf Stream would be diverted, and its warming effects cut off. Mr. Richardson ingeniously follows out the results until he is led to suggest that such an elevation, co-operating probably with other causes, might bring about a Glacial epoch.

SOME notes on the mineralogical and physical properties of certain rocks of Savoy have been communicated to the Geological Society of France by M. Jannettaz. The author has paid especial attention to the thermal conductivity of the rocks in different directions, and insists on the value of observing this physical characteristic as an aid to crystallographic determinations. Thus he finds that the unaltered crystals of leucite from Rocca Monfina, when cut into cubes parallel to the primitive form and tested for conductivity, exhibit on all faces perfect circles, showing, of course, that the heat is equally conducted in all directions, and thus suggesting the regular or monometric character of these disputed crystals.

ON May 1 of last year Mr. C. F. Hartt was appointed chief of the Commission charged with undertaking a geological survey of Brazil. The first-fruits of this work have appeared in the June number of the *American Journal of Science*, in the shape of Mr. Hartt's preliminary report on an auriferous district in Minas Geraes.

A PAPER on the Cretaceous Ammonites, containing an analysis of the *Ammonitidae*, has been contributed to the *Zeitschrift der deutschen geologischen Gesellschaft*, by Dr. Neumayr, of Vienna. The following new genera of Ammonites are formed by the author:—*Schloenbachia*, *Hoplites*, *Olcostephanus*, *Acanthoceras*, and *Stoliczkaia*.

PERHAPS the Geological Notes will be the fittest place for brief reference to a recently-published work entitled *Man; Palaeolithic, Neolithic, and several other Races, not inconsistent with Scripture*, by Nemo (Dublin: Hodges, Foster, and Co.). After examining the six days of Genesis by the light of geological science, the author seeks to harmonise the results of modern discovery with the literal interpretation of Scripture. Placing the first appearance of man in the Pliocene, or as far back as may be required by the science of the future, he maintains that there were several successive creations of human beings prior to that of the special Adam. It would be, perhaps, unfair to criticise a book of this character from the stand-point of strict science.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY.—(Tuesday, June 6.)

PROF. WESTWOOD, President, in the Chair. Mr. Douglas made some further remarks on the "Corozonuts," known as "vegetable ivory," exhibited by him at the last meeting, which were attacked by a beetle of the genus *Caryoborus*. The officials of the Dock Company were anxious to ascertain whether there was any mode of arresting their depredations, and whether the beetles lived and bored among dried nuts, or entered the kernel in an earlier stage. It was suggested that the mischief originated in the parent beetles laying their eggs in the nuts when still in a green or soft state, the metamorphosis taking place inside the nuts. Mr. McLachlan, in connexion with the above, exhibited the nuts of a species of *Caryoborus* (*C. bactris*), forwarded to him by Prof. Dyer. In this case each nut served as food for a single larva only, which bored in it a cylindrical hole of considerable size and depth; whereas the former nuts were infested with several larvae in each nut.—The President exhibited the larva of an Australian species of *Hepialus*, from Queensland, having a singular fungus, with four or five different branches, issuing from the back of the neck and the tail; also a fungus growing out of the back of a *Noctua* pupa.—Mr. McLachlan, on behalf of Dr. Atherstone, of South Africa, exhibited a couple of very singular Orthopterous insects (belonging to the *Acrydiidae*) which, in colour and in the granulated texture, so exactly mimicked the sand of the district as to render it almost impossible to detect them when in a quiescent state. The insect was supposed to approach the *Trachyptera scutellaris*, Walker. Also some very peculiar cases, one belonging to a beetle of the genus *Paralichas* (one of the *Dascillidae*), and another belonging to a species of *Oiketicus*. To the latter were attached a number of small angular pebbles, which added considerably to its weight.—The President read descriptions and exhibited drawings of two very singular forms of Coleoptera from Mr. A. R. Wallace's private collection. For the first, which belonged to the *Telephoridae*, he proposed the generic term *Astychina*, remarkable for the form of the terminal joints of the antennae in one sex, which were modified into what appeared to be a prehensile apparatus, differing from anything known in the insect world, but of which some analogous forms were found to occur among certain Entomostreous Crustacea. The other pertained to the *Clavidae*, and was named *Anisophyllus*, differing from all known beetles by the extremely elongated branch of the ninth joint of the antennae.—Mr. Smith read descriptions of new species of Hymenopterous insects from New Zealand, collected by Mr. C. M. Wakefield.—Mr. J. S. Raly communicated descriptions of new genera and species of *Halticinae*.—Dr. Sharp communicated descriptions of a new genus and some new species of *Staphylinidae* from Mexico and Central America, collected by Mr. Salvin, Mr. Flohr, and Mr. Belt.—Part I. of the *Transactions* for 1876 was on the table.

ZOOLOGICAL SOCIETY OF LONDON.—(Tuesday, June 20.)

PROF. FLOWER, F.R.S., in the Chair. Mr. Sclater read extracts from letters received from Signor L. M. D'Albertis and Dr. George Bennett. Dr. A. Günther read a letter from Commander W. E. Cookson, R.N., respecting the large tortoises obtained in the Galapagos Islands which had been recently deposited in the Society's gardens by Commander Cookson. Mr. G. E. Dobson read a paper on peculiar structures in the feet of certain species of mammals by which they are enabled to walk on smooth perpendicular surfaces, especially alluding to *Hyrax* and the bats of the genus *Thyroptera*. A communication was read from the Rev. O. P. Cambridge, containing a catalogue of a collection of spiders made in Egypt, with descriptions of new species and characters of a new genus. A communication was read from Mr. W. T. Blanford containing remarks on the views of A. von Pelzel as to the connexion of the faunas of India and Africa, and on the Mammalian fauna of Tibet. A second communication from Mr. W. T. Blanford contained remarks on some of the specific identifications in Dr. Günther's second Report on collections of Indian reptiles obtained by the British Museum. Mr. Howard Saunders read a paper on the *Sterninae* or Terns, with descriptions of three new species, which he proposed to call *Sterna tibetana*, *Sterna eurygnatha*, and *Gygis microrhyncha*. Dr. Cunningham, of the

University of Edinburgh, described a young specimen of a dolphin, caught off Great Grimsby in September, 1875. A communication was read from Mr. R. B. Sharpe, F.Z.S., containing the description of an apparently new species of owl from the Solomon Islands, which he proposed to call *Ninox Solomonis*. Dr. A. Günther read some notes on a small collection of animals brought by Lieutenant V. L. Cameron, C.B., from Angola. A communication was read from Lieutenant R. Wardlaw Ramsay, giving the description of a fine new species of Nuthatch, from Karen-nee, which he proposed to call *Sitta magna*.

METEOROLOGICAL SOCIETY.—(Wednesday, June 21.)

THE last ordinary meeting of the present session was held on Wednesday, June 21, at the Institution of Civil Engineers; H. S. Eaton, M.A., President, in the Chair. The following papers were read: "On the Climate of Scarborough," by F. Shaw, F.M.S.; "Notice of Upward Currents during the Formation and Passage of Cumulus and Cumulo-stratus Clouds," by the Rev. Joseph Crompton, M.A., F.M.S. On November 1, 1866, the day after the visit of the Prince and Princess of Wales to Norwich, when the city was profusely decorated with flags, the author, when walking close to the cathedral, was struck with the unusual fluttering of the flags on the top of the spire, which is 300 feet high. They were streaming with a strained, quivering motion perpendicularly upwards. A heavy cloud was passing overhead at the moment, and as it passed the flags followed the cloud and then gradually dropped into comparative quietness. The same phenomenon was noticed several times. As the cloud approached, the upper banners began to feel its influence and streamed towards it, against the direction of the wind, which still blew as before steadily on all below; as the cloud came nearer the vehement quivering and straining motion of the flags increased, they began to take an upward perpendicular direction right into the cloud, and seemed almost tearing themselves from the staves to which they were fastened; again, as the cloud passed, they followed it as they had previously streamed to meet its approach, and then dropped away as before, one or two actually folding over their staves. All the other flags at a lower elevation did not show the least symptom of disturbance. "Suggestions on certain Variations, Annual and Diurnal, in the Relation of the Barometric Gradient to the Force of the Wind," by the Rev. W. Clement Ley, M.A., F.M.S. The author finds that the mean velocity of the wind corresponding to each gradient is much higher in summer than in winter. This is the case at all stations (though not equally), with all winds, with all lengths of values of radius of isobaric curvature, and with all values of actual barometric pressure. The general character of the mean diurnal variations of velocity, as these occur at the stations in the British Isles, may be fairly inferred from mean hourly velocity curves, and may be thus described: At the inland stations, in summer, a slight increment of velocity occurs about midnight. This is succeeded by the morning minimum, which takes place, in most of the months examined, a little after sunrise. The mean velocity then rises until 1 P.M., when the diurnal maximum is sometimes attained. A slight subsidence then commonly occurs, but the mean velocity rises again at 3 or 4 P.M., and this second increment frequently forms the diurnal maximum. A great fall then takes place, which is more rapid than the rise in the morning; and the evening minimum, which is in most months the diurnal minimum, is attained about 10 P.M. The mean velocity at 1 P.M. is, in fine and hot weather, more than double the 10 P.M. velocity in miles per hour, and exceeds the diurnal mean by about one-third. In winter the inflexions are very greatly modified. The midnight rise is not in all months traceable, and the subsequent diminution is not very great. The morning maximum occurs about sunrise. The diurnal maximum takes place about 1 P.M., is less than double the minimum in miles per hour, and exceeds the mean of the day by about one-fifth only. "Average Weekly Temperature of Thirty Years (1846-75) at Cardington," by John McLaren, F.M.S.; "De la Vulgarisation par la Presse des Observations Météorologiques," by M. Harold Tarry, F.M.S.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—(Wednesday, June 21.)

STEE CUMING, Esq., F.S.A. Scot., in the Chair. Attention was called to the ancient walling of St.

Mary Aldermary, London, now exposed by the restoration in progress, and showing the extent of the damage to the building by the great fire of 1666, and the amount of the work executed afterwards by Sir C. Wren. The ancient objects exhibited consisted of the results of several excavations in the metropolis, and included many examples of fictile vessels of great beauty, several perfect specimens of mediæval pottery, and other objects pronounced to be of Roman date by the members present. These were exhibited by the Chairman, the Rev. S. M. Mayhew, and others. A series of interesting drawings of the Saxon church at Boarhunt were exhibited by Mr. Irvine. The paper of the evening was by Mr. Thos. Morgan, and treated of the date of the erection of the various cromlechs and kindred structures of England. An animated discussion followed, in which Dr. Phene, Mr. Lewis, and others took part. The discovery of ancient Roman material forming the walls of Tollesbury Church, Essex, was reported by Mr. Brock, who exhibited drawings of an interior arch formed entirely of Roman bricks. It was announced that the council had ordered the preparation of plans of the ancient vaults at the junction of Jewry Street with Aldgate, now about to be demolished.

SOCIETY OF ANTIQUARIES.—(Thursday, June 22.)

CHAS. F. HAYWARD, Esq., exhibited a set of drawings of the restoration of ancient wall-paintings discovered in Copford Church, Essex. The church is of early Norman work, and consists of a nave, south aisle, and transept. In the chancel Roman bricks are found. Some portions of the painting, especially the architectural ornament, may belong to the eleventh century; but the chief part was probably restored in the fourteenth century. The scheme of the painting is as follows. In the arch of the chancel over the window is a Majesty. Christ is represented seated on a throne, with a rainbow behind it and clouds beneath His feet. His right hand is in the attitude of benediction, and His left arm rests on a book. The wounds are visible in His hands and feet. Below the Majesty are angels, and in the background the towers of the New Jerusalem. On each side of the window stand four apostles under canopies. Along the main soffit of the chancel arch are represented the signs of the Zodiac, with the sun and moon at the ends. Only a few of the original figures were found, and the rest are fancy restorations. Among the former was Virgo with a nimbus, representing the Mother of our Lord. These paintings were discovered by the plaster which had hidden them peeling off the wall. Exact tracings were taken at the time, and served as a basis for the restoration; but Mr. Hayward was not able to exhibit these.—W. H. Weale, Esq., exhibited rubbings of eight incised sepulchral slabs from the Low Countries. The earliest slab bearing a date is of 1262, and represents a knight in mail with a linen surcoat, and one small ailette on the right shoulder. The arms are three *fleur de lys*. In this and in another figure the eyes are visible through the slits of the helmet. In two others, dated 1296 and 1307, the ailettes are of very large size, and bear the arms of the wearers, in one case a simple chief, and in the other a cinquefoil. One effigy is in civil dress, that of John Doyssen, who died in 1334. His gown is ornamented with parrots, and he bears for his arms two lions *passant*, in token of his descent from William the Conqueror. The character of these effigies is very similar to that of brasses of the same period.—J. Turtle Wood, Esq., gave an account of an inscription discovered by him in part of the wall of the peribolus of the Temple of Artemis at Ephesus. The subject of the inscription was a record of the setting up of the stones (*στῆλαι*) which marked the boundary of the sanctuary. It seems that this did not entirely surround the temple, but was a continuation of the peribolus on the sides nearest the city.

PHYSICAL SOCIETY.—(Saturday, June 24.)

PROF. G. C. FOSTER, President, in the Chair. Prof. Guthrie showed the action of Prof. Mach's apparatus for exhibiting to an audience the effect of lenses on a beam of light passed through them. It consists of a long rectangular box, with glass sides, in which are several moveable lenses. A parallel beam of light falls on a grating at one end of this box, and is thus split up into a number of small beams, which are rendered visible by filling the box with smoke. After

passing through the first lens the rays fall on a moveable white rod, which may be placed to indicate the focus. The light then falls on another lens, partly covered with red and partly with blue glass, in order to more precisely exhibit the paths of the rays.—Baron Wrangell exhibited the apparatus employed by Petrochovsky in his magnetic experiments. These experiments had reference to (1) normal magnetisation; (2) the measurement of the distance of the poles of a magnet from its ends; and (3) a thermoelectric apparatus.—Prof. Barrett made a communication on the magnetisation of cobalt and nickel. He has recently made some experiments on these metals with a view to ascertain whether they undergo any elongation or contraction similar to that experienced by iron during magnetisation. From his first experiments he concluded that cobalt elongates slightly, but that there is no effect on nickel; this latter result, however, may have been due to the fact that the metal was not absolutely pure. He has, however, obtained through Mr. Gore a fine bar of pure nickel about two feet in length, and now finds that it contracts, and that the amount of this contraction is about the same as the expansion of a like iron bar when similarly treated.—Prof. Guthrie described some experiments on the freezing of aqueous solutions of colloid substances, which he has been studying in connexion with his recent investigations on cryshydrates, &c. If a solution of sugar be gradually cooled, the temperature at which ice separates out is always below 0° Cent., and the extent below increases with the amount of sugar in solution; but he finds that in a solution of gum having exactly the same chemical formula the ice always separates at 0° Cent., whatever be the amount of gum present. Thus, while every crystalline substance forms a freezing mixture when mixed with ice or snow, colloids are incapable of doing so. The gum and the water do not recognise each other; and similar results were obtained in the case of gelatine and albumen. These facts are strictly in accordance with the results of Prof. Graham's classical researches. It almost follows that, when heated, similar effects are observed, and Prof. Guthrie has found that solutions of gum in varying proportions always boil at 100° Cent.—Prof. Guthrie showed the experiment by which Dr. Kerr has recently proved that glass, resin, and certain other substances exhibit a depolarising effect when under the influence of a powerful electrical tension.

ROYAL GEOGRAPHICAL SOCIETY.—(Monday, June 26.)

THE last general meeting of the session was held under the presidency of Sir Rutherford Alcock. A communication was read from General Stone, chief of the Staff at Cairo, detailing the circumnavigation of Lake Albert by Signor Gessi, one of Colonel Gordon's party, who started on his trip from Magungo on April 12. He has discovered the lake to be 140 miles long, and fifty miles wide; the southern end is very shallow, and the western side very mountainous. The lake proves thus to be of about the same size as conjectured by Speke when he inserted it in his map in 1862, under the name of Luta Nzige. A detailed report and map are promised. A letter from Sir Samuel Baker was read, containing some remarks on the survey of the lake, and another letter from the Foreign Office, giving some information which had reached Cairo respecting Gordon's movements, who, it appears, had reached the river Somerset, and had established a station at Masindi. The surrounding country is reported to be quiet and submissive. Gordon has occupied Magungo, and established communication with Duffle, a station on the White Nile, where the iron vessels and a steamboat have arrived. He hopes within a year or two to render the territories surrounding the Victoria and Albert Lakes perfectly safe for merchants and travellers. After some remarks from Lieutenant Cameron, who related the information which had been supplied to him when at Nyangwe respecting the Lake Mwutan Nzige (Albert), the President congratulated the society on the discovery that Lake Albert was a closed basin at its southern end, and that it thus formed one of the sources of the Nile.

A paper was read by Captain Hay on the district of Akim, in Western Africa, the principal point of interest in which was his description of a curious enlargement of the cheek-bones, resembling horns, which was noticeable in several of the inhabitants.

The last paper was an abstract of an old native account of Eastern Turkestan, and the routes leading

from thence into Kokand, across the Pamir and in other directions, communicated by Mr. R. B. Shaw.

During the evening announcement was made by the President that the Government had agreed to contribute 3,000*l.* towards defraying the expenses of Lieutenant Cameron.

FINE ART.

Three Hundred French Portraits, representing Personages of the Courts of Francis I., Henry II., and Francis II., by Clouet. Autolithographed from the Originals at Castle Howard, Yorkshire, by Lord Ronald Gower. Two Vols. (London: Sampson Low & Co., 1875.)

THESE two volumes contain three hundred reproductions in autolithography of chalk drawings—portraits, for the most part, of distinguished personages who figured at the Court of France during the sixteenth century. The reproductions are printed on good paper, and although the margins in some cases are somewhat insufficient, and this detracts from the general appearance of the pages, yet the book is an unusually handsome and costly production for the present day; and Lord Ronald Gower has shown great courage, enterprise, and industry in carrying through so considerable an undertaking. The originals, vaguely described on the title-page as by "Clouet," are at Castle Howard, which Lord Ronald politely calls the Versailles of Yorkshire. They are executed mostly in black, red, and yellow chalks, and, as the copyist says, much of their picturesque character is necessarily lost in his monochrome lithographs. He has, however, been so careful to observe and follow differences of handling that, in spite of the loss of colour, many of his reproductions might actually be made use of for purposes of comparison and collation. Though not of great artistic value, they have the rare merit of being copies which afford some trustworthy information to the expert, and as a gallery of contemporary portraits have a great attraction for those interested in the history and literature of the day.

In the preface Lord Ronald has briefly abridged those facts concerning the pedigree of the Clouet family (for there were three painters of this name) which were for the most part gathered together by the unwearied diligence in research of the late Comte de Laborde, and by him published in his work on the *Renaissance des Arts à la Cour de France*. Lord Ronald does not, however, refer to M. de Laborde as his authority (the main facts have, indeed, been reprinted in the Louvre catalogue), and, though he mentions the visit which this distinguished critic paid to Yorkshire expressly that he might examine the collection of French portraits at Castle Howard, he does not indicate that de Laborde's remarks on this special subject have a weight which cannot attach to those of Dibdin, or even of Passavant and Waagen. It must, however, be supposed that Lord Ronald has made use of M. de Laborde's notice of the collection, if not in compiling his preface, at least in making out the list of the portraits which follows it.

Eighty-eight only out of the entire collection of portraits were shown to M. de Laborde, but something more than that

number were examined by myself on a more recent visit. The names inscribed on these drawings in most cases were somewhat illegible, and often where they could be read it was not easy to identify the person meant. M. de Laborde, on his return to Paris, was obliged to have recourse to the assistance of two other authorities, M. Niel and M. Lacabanne, and with their help a large proportion of the eighty-eight were satisfactorily made out. On comparing the list given in the second volume of the *Renaissance des Arts* with the more lengthy catalogue of Lord Ronald, it will be found that all the important elucidations given by him are derived from de Laborde, although he has neglected to avail himself of several useful indications, and in some cases has so curtailed those quoted that they will furnish little or no information to those who may consult the catalogue for antiquarian purposes. For instance, take No. 52, the portrait of a woman which bears the word "Motignac." The three French experts made a conjectural emendation of this word to Montejan, and added that, if this could stand, the subject would be a certain "Philippe de Montespedon, veuve de René seigneur de Montejan, et remariée avec le prince de la Roche sur Yon." Here Lord Ronald prints the inscription Motignac, then simply brackets after it Philippe de Montespedon, omitting not only to tell us who the said Philippe could be, but omitting also to give the hypothesis on which her identification as Princesse de Motignac is alone possible.

Francis Clouet, painter to Francis I., was a naturalised French subject; his father was a John Clouet, who had also been in the service of the French king, and a second John Clouet, known to have worked in the pay of Charles the Bold, Duke of Burgundy, is supposed to have been perhaps his grandfather. It is, says Lord Ronald, to Francis Clouet that we "undoubtedly owe the greater portion" of the drawings which he has reproduced; and again he speaks of "Francis Clouet, the largest collection of whose drawings in England, if not in Europe," is at Castle Howard. If there were seven, if there were five, if there were even three, drawings by Francis Clouet in this assemblage of three hundred French portraits, it would be the largest collection of his drawings in England, and indeed in Europe. But are there three? Is there even one? M. de Laborde, speaking of the eighty-eight seen by him, a number which included the best of those now reproduced by Lord Ronald, does not in a single instance attribute their execution to Francis Clouet. Throughout his work he only mentions one drawing (then in the possession of M. Reiset) as pretty surely the work of this painter. There is a fine drawing (No. 682) by him in the Louvre, and another by the same hand in the Albertina at Vienna, and no one who has seen these two portraits would hesitate to say that not one of the drawings in the Castle Howard collection could possibly be by the same person.

Lord Ronald next goes on to state that there "can be little doubt that these are the original studies taken from life." This is, in any case, highly improbable. Every ex-

amination of similar collections (and that of the Bibliothèque Nationale not only rivals but outnumbers that at Castle Howard) serves to show the probable correctness of the theory started by M. de Laborde, that French coloured-chalk drawings up to about 1560 were made, not from life with the intention of painting from them, but from portraits already painted, and for the purpose of reproduction. It was the fashion—a fashion to which Brantôme makes many allusions—to possess a cabinet of portraits, and drawings were within the means of those who could not afford paintings. The Castle Howard collection noticeably illustrates this position. M. de Laborde thought that the eighty-eight he saw had formed a single series "composé tout d'une pièce," but he also observed that some showed traces of having been reproduced from miniatures, while others had evidently been copied from large pictures. But M. de Laborde saw only a part, and a small part, of the whole. The collection as seen by myself, though not amounting to the number, three hundred, reproduced by Lord Ronald, was evidently not formed "tout d'une pièce." It was a congeries in part of several collections, the drawings for which had been made by three or four different hands, and Lord Ronald's own reproductions are quite faithful enough to show their more evident peculiarities. In several cases, moreover—take for example Nos. 64, 69, and 79, portraits of Beatrix Pacheco, one of the women of Eleanor, sister to Charles IX. and wife to Francis I.; and, again, Nos. 66 and 88, portraits of the Duchesse d'Etampes—we get repetitions from some one original picture; and similar instances occur many times over in these volumes. There will be in each, perhaps, slight variations which indicate something beyond the mere variations of touch and method induced by varying hands. The chain of gold which lies across the breast in one portrait of M^{de} d'Etampes will be replaced by a chain of pearls in another; but the lines are the same, the curves of the chain are identical in both. The difference of workmanship is not such that either of these two drawings could well pretend to be the original of the other, but it is just such as would naturally arise in the work of two men interpreting each after his own fashion a common model, that model having been executed in a totally different material from that employed in the task of reproduction.

In spite of imperfections, this Gallery of French Portraits, as reproduced in these volumes, is a valuable contribution to the literature of the subject. It is so important to know where things are, what they are, and in what number, that day by day catalogues, and above all illustrated catalogues, increase in value and interest. A little more skill, or a little more knowledge, would have made the present work of the first importance. As it is, the intention is good, but the reproductions, though careful and conscientious, are just not quite excellent enough to have an independent artistic value, while from an historical or antiquarian point of view the text must be considered meagre, and the critical portion is simply misleading.

E. F. S. PARTISON.

THE BLACK-AND-WHITE EXHIBITION.

(Second Notice.)

WE have to conclude our critique of this collection, and shall do so without pausing much upon individual works.

Drawings.—Legros, *Les Bords de l'Ouche près de Dijon*, a fine drawing, free and simple, and elegant too in its general result. Richmond, *Hercules and Prometheus, Study for a Picture*, in red chalk: the most important contribution here for size and theme. Hercules has just shot off an upward arrow—it may be supposed, against the vulture which has so long been the executioner of Jupiter's revenge upon Prometheus: he, now unchained, shifts himself along his rock-ledge with something of the rigid unreadiness which tells of long confinement. His figure comes all included within the line of the rock-contours: so that the semi-pyramidal crag-summit, and the frame of Hercules tapering vertically from the feet, make up the entire form of the design, taken in its primary impression on the eye. This is a vigorous and striking performance: when we acknowledge that it falls short of inspiration, we feel that there is not much else to be objected to it. Lhermitte, *Vieille Bourguignonne*, a study of unmitigated naturalism, grandly true. Mme. Cazin, *A Windmill on the French Coast*, excellent. Mrs. Hopkins, *The Stepping-Stones*, with a female infant at a nonplus how to cross them; the best of this lady's amusing fantasias on the theme of babyhood. Guillon, *Old Street at Vézelay, Yonne*, noticeable for its strong linear streaks of sun-shadow. Cave Thomas, *Studies*: a head of an aged man with a long beard, and another of a lady with steadfast and vivid eyes; fine red-chalk drawings, the latter especially a covetable specimen from a most highly trained hand. Henriette Corkran, *Portrait of Mrs. C.*, a countenance striking in mould and mien, somewhat Tennysonian; the artist has worked with a true feeling for the opportunities of her subject-matter. Andrews, *Portrait of Thomas Carlyle*, red chalk; sufficiently impressive at a cursory glance, but probably not very exact to the details; founded, it might seem, on a good photograph which has been engraved in one of the volumes of the illustrious author. Fyfe, *A Good Catholic; Hangin' out the clothes; The Day of Rest*; three rather large single figures, distinguished for sure-handed solidity and uniform robustness of effect—a little too uniform and methodical. The first is a figure of a small Italian girl, which has been carried out and exhibited as an oil-picture; the second is perhaps the best of the trio. E. R. Taylor, *Nearing Home*, the design for an excellent picture of three seamen which we had occasion to praise in the present Academy exhibition. J. Moyr Smith, *A Lesbian Lyric Singer in Mitylene*, B. C. 600. This is hung high up, and we scarcely follow the artist through all the details of his rather thronged composition; he combines humorous with classical elements into a somewhat noticeable whole. Arthur Severn, *The Sea at Brighton, March 12, 1876*; a heavy swell of waves, the surf blown forwards with angry puffs off their crests; here is a good deal of particular study, without loss of generalism. Rudolph Blind, *A Reading*; three women and a girl, in the costume of the beginning of our century, under the spell of a book, romance or poem, which they are perusing in a garden; a certain German largeness of form and style mixes, but hardly fuses, with the more domestic quality of expression natural to such a subject in English art. *The Sands of Dee* is another work by the same designer. Arthur Hopkins, *An Old Recipe for a Sleeping Draught*; a drawing of sheep, cleverly treated; we do not understand the application of the title. J. W. Waterhouse, *Remorse of Nero*. The youthful tyrant lies half-procumbent on a couch; a mortuary inscription to Agrippina in the background of the chamber emphasises the meaning of the artist. The face is not by any means a recognisable portrait of Nero; the general

treatment is of more than average ability. Pille, *A Midsummer Night's Dream*. Here again is a title which seems to have little relevancy to the subject-matter, which is a lord and lady of the close of the fifteenth century, about to go out hawking with their hounds. There is plenty of pictorial dexterity in this design, with little further to engage the attention. Allongé, *Autumn*; an alley of trees in a park, thinning as the year wanes to the light of steadily-brooding sun-rays; a brace of deer trip forward into the road; the whole executed with skill and appropriate feeling. Penstone, *Harvest-tide*; a reaper, and a girl beside her corn-sheaves, resting for a minute as they stand, and evidently with their thoughts bent the one on the other; very simple in the disposal of the figures, yet none the less with a good quality of design. Laville, *Retour du Culvaire*. The eye-witnesses of the crucifixion are wending homewards, heart-wrung and dazed from the cruel spectacle. The subject is finely chosen, and capably invented too, with something of the emotional realism which Delaroche developed in similar subjects, but in a comparatively commonplace style. G. Peplow Brown, *Rebekah and Abraham's Servant*. We do not remember having encountered this designer before. His drawing is of more than average size, noticeable for the grand and consentaneous posing of the camels (a very prominent element in the design), and generally characterised by freshness and boldness: we shall look to see fine things from the same hand, if, as we presume, the artist is at the opening of his career.

Among other works deserving of attention we may name—Henry Keene, *Wych Street, London*; C. O. Murray, *A Nereid, decorative panel*; Gosset, *Pen-and-Ink Drawings*; Mossy, *Mont Can, près de Nice*; H. H. Johnstone, *A Lanner Falcon*; M. Alice Tapson, *Nellie*; Joanna Samworth, *A Quiet Nook*; A. G. Bell, *Hampstead*; Harper, *A Portrait*; Yeats, *The Lute-player*; F. E. Cox, *Down-hill*; Montbard, *Le Sauvetage*; Hamon, *Tête de Jeune Femme*; L. L. Pocock, *Sans Souci*; Tom Pyne, *The Chapel of St. Werner, Oberwesel*; Frank Murray, *Old Doorway, Bloomsbury, Summer Morning*; Bonnat, *Italienne*; Dardoize, *Solitude*; Fairer, *Rosebuds*; Louis Fagan, *Madonna and Child after Raphael*.

Etchings, &c.—Several of the leading examples in this class were mentioned in our previous notice. On the present occasion we need not enter into detailed description or specification of the residue; but must mention as observable, and mostly as praiseworthy, Messrs. Fantin, Bradley, Meyer, Mallock, Bellenger, Pilotell, and Lacrete. The collection, in glass cases, of implements &c. illustrating the processes of Etching, Line-engraving, and Wood-engraving, may be examined with profit, and with much curious interest. To these are added some Decorative Tiles painted by Mr. Marks.

W. M. ROSSETTI.

THÉOPHILE SILVESTRE.

Paris: June 22, 1876.

Yesterday, June 21, at noon, Théophile Silvestre, the original and powerful critic of French art, was seized, at the end of a hurried breakfast, with congestion of the brain. He died an hour afterwards, conscious of what had happened, but not thinking that the danger was so imminent. The news which had just reached him of his friend M. Bruyas, of Montpellier, having been nominated to the Legion of Honour had affected him deeply.

I mentioned M. Bruyas's name some months ago in connexion with an album of lithographs executed by M. Jules Laurens from the principal pictures in his collection. The collection, I then told you, showed singular taste and independence of character; it contains specimens of the work of the chief colourists and romantic painters of the day—Eugène Delacroix, Courbet, Diaz, Millet,

Théodore Rousseau, Corot, &c. Valued at a considerable sum, it was generously offered by M. Bruyas to the Museum of Montpellier, his native town. Not content with delivering over these masterpieces, long ignored or insulted by official schools, to the public to study and admire, and having them multiplied by means of the clever and faithful pencil of M. Jules Laurens, he was anxious also to perpetuate their history and nature, and requested Silvestre to make a catalogue of them. Silvestre had been engaged on the work for some years, writing an historical description of each picture, giving precise details about each master, and recording everything that from a technical or critical point of view could enhance the interest of the several works. He had just despatched the last proofs, signed for press, to Quentin, the printer (who a few days ago succeeded the celebrated J. Claye). But death takes no notice of little details of this kind. Hungry and fierce, like an eagle on a rabbit, he pounces down on his victim.

Théophile Silvestre dies at an unfortunate time, as regards both his fame and himself. I have no business to talk politics here, but I cannot hide from you that he received the advances of the Empire in a way much to be regretted. He had been appointed commissary of the Republic in the Ariège, his native department, in 1848, and signalled himself by his hasty and fiery proclamations. But this splendid zeal did not last long, and the publication of the Tuileries papers has but too well proved the extent to which he had allowed himself to be taken into the confidence of Napoleon III. The newspapers he started and edited, with more ardour than wisdom, bore the unpardonable stamp of being secretly subsidised.

Théophile Silvestre was born in 1823, in the Ariège, one of the departments of France where the blood of the people is most fiery. He was short and stumpy in figure, with broad stooping shoulders, a brown olive-complexioned face, large sensual mouth, and powerfully-modelled brow. He wore his hair, which was black, cut short like a monk's. His black eye-brows stood out from the superciliary arch like brushwood on the edge of a precipice scorched by the sun, and almost concealed the round, black, restless eyes, eyes which were full of fire and irony, of boldness, curiosity, and childlike naïveté. He looked like one of the Spanish priests who accompanied Don Carlos, a crucifix at their girdle, a torch or a musket in their hand. But his fervid, picturesque, sonorous utterance, when intent on explaining some picture or convincing a hearer, soon revealed intelligence of an unusual order.

His book entitled *Histoire des Artistes vivants et étrangers, Etudes d'après nature*, is unique of its kind in French contemporary criticism, on account of the truth of its portraits and its shrewd judgments, its well-chosen examples and forcible language. It was published in 1856, in large 8vo, by E. Blanchard, and contained eleven portraits, which Masson, showing a desire for exactness novel in those days, had engraved from daguerreotypes. To each of the several studies on the painters and sculptors was added a catalogue of their most important productions. The work had no success, nor the small duodecimo edition either, which came out a little later. Only a few weeks ago, at a shop where remainders form the staple article of trade, it was to be had for five or six francs!

And yet it is the most vigorous, the clearest, the most impassioned and most profound account that exists of the chiefs of the contemporary school, those at least, both painters and sculptors, who so brilliantly distinguished themselves at the Exposition Universelle of 1855—Horace Vernet, Ingres, Eugène Delacroix, Corot, Chenavard, Decamps, Barye, Diaz, Courbet, Préault, and Rude. The list, to be sure, is incomplete. Silvestre, who could not have foreseen such disgraceful indifference on the part of the public, would have fulfilled the

promise of his title in a second volume. He had even had some of the portraits engraved beforehand, among others that of the German painter Cornelius. But his book excited the most violent animosity. It was stifled by the combined action of the accusations to which his want of decorum in his social relations gave rise, and the silence with which the higher criticism, which saw in it the most revolutionary of rivals, received it.

He had adopted the system of personal information in all its rigour, which allows us to judge the artist by apparently the most indifferent of his actions as a man. As diplomatic as an Italian cardinal, and as patient as a sportsman on the watch for wild ducks, as cunning as a Red Indian and as sober as a peasant of the South, he shunned no trouble in order to gain access to the artists themselves, sit by their firesides and roam about their studios, follow them to the country, get them to tell him their histories, listen to their theories, scrutinise their several methods of painting, drawing and engraving, of kneading their clay and rasping their marble. His greatest achievement in that line was taming Barye, the shyest of men, so shy and taciturn that several of his intimate friends never exactly knew how many children he had! Silvestre rescued him from great difficulties, and enabled him, without the public knowing anything about it, to buy back all the models of his bronzes which had been swallowed up in a failure.

He succeeded in getting Eugène Delacroix, in spite of his being such a consummate diplomatist, to show him those precious note-books in which he every evening jotted down his opinions on the men and the events of the day. He made Gustave Courbet dictate peasant-songs to him, songs guiltless of rhyme or metre but full of wonderful feeling. He noted down all the *mots* of Préault the sculptor, witty and biting as a journalist of the eighteenth century. He copied and published—thereby entangling himself in a law-suit—the letters wherein Horace Vernet describes his travels in the East, and they give one the impression of having been edited by a subaltern of the African army.

These materials, the fruit of such careful study both of the models and works, he then condensed into a short but intensely effective notice. His concise sentences, the absolute precision of his substantives, the picturesqueness, the variety and boldness of his adjectives, a taste of a classical style enriched by all the movement and the licence of the romantic style, constitute him a writer of the first order, not so spontaneous, perhaps, as Théophile Gautier, but more condensed. He had the French understanding. He was the first to attack Ingres and his school openly—doing full justice to his energetic draughtsmanship, but protesting against his abuse of Italian formulas, and his haughty contempt for living life. He is sometimes wanting, not in absolute justice, but in seasonableness. He wrote slowly and laboriously, and his newspaper articles, inferior as they are to his book, drew down upon him some vigorous attacks.

He leaves an unfinished work behind, which will no doubt be put together by his family or friends. He published, besides, a small volume on Eugène Delacroix at the time of the posthumous sale of his studio; also a lecture on the English school, delivered in London in the rooms of the Royal Academy, which I believe met with no great success. He wrote some criticisms on the Salons in the *Nain-jaune* and *Le Figaro*. But work of that kind, wearisome and childish as it is, did not suit him. His pen was not clever at improvising. His mind was too positive, his criticism too cutting. He used a club to crush flies.

He is seen at his best in the articles he published after the deaths of Théodore Rousseau and J. F. Millet. There he displays his extensive learning, great power of analysis, and unrivalled skill in describing with the pen what the master had felt and expressed with the brush or the pencil.

Silvestre had lived near these two painters for the last two years at Barbizon, the village which lies on the border of the fertile plains of La Brie and the most solemn and poetical shades of the forest of Fontainebleau. From day to day, and season to season, he had looked with Rousseau and Millet upon the earth, the air, the verdure, the farms, and the cottages they preferred to all others, and on the people, with their strongly-marked nationality, that inhabit them. He also paid several visits to Gréville, J. F. Millet's native village, on the shores of the Channel. Thus he knew him from the cradle to the grave.

As one critic dies another springs up. M. Fromentin, tired of being a painter, takes to writing. He was supposed to be aiming at the Institute, and is standing for the French Academy. We do not complain. M. Fromentin's elegant and superficial painting could not withstand the effect of time, and lost its charm. His writing, on the contrary, gains in power. The pictures he sent to the last Salon are laboured and dull, whereas the volume of criticism, *Les Maîtres d'autrefois, Belgique et Hollande* (E. Plon), is lively, ingenious, and carefully worked out, and altogether well worth the notice of every one who is interested in the unusual art of being a good judge and of saying what you have to say well.

I drew your attention, at the beginning of last year, to A. Lemerre's reprint in two octavo volumes of M. Fromentin's two studies, *Un Été dans le Sahara* and *Une Année dans le Sahel*. They are recollections of a visit to Africa, describing in a wonderfully realistic manner—the first more especially—the sensations of an impressionable observer with an artistic eye.

M. Fromentin is now devoting his rare and exquisite faculty of observation to the study of the works of the masters, more especially Rubens and Rembrandt. His style is distinguished for its great elegance. His judgments are those of a painter—that is to say, they are based on the explanation of technical processes. This is realising the ideal. M. Fromentin has, it seems to me, understood Rubens better than Rembrandt. The fact is that Rubens is a master of dash and *verve*; Rembrandt's genius deals rather with the homely and familiar. With the former the outward guise is everything, with the latter the inner sentiment.

PH. BURT.

THE NATIONAL GALLERY.

THE ninety-four pictures selected by the Director of the National Gallery to form the Wynn Ellis bequest are now arranged on the walls of the room which was previously occupied by the works of Rubens. They form a most interesting series, chiefly illustrative of the art of the Dutch and Flemish schools, but comprising, nevertheless, one or two examples of Italian art that demand attention. The most noticeable of these is a small tempera picture of an angel with bent head and joined hands, in the act of adoration. This work is attributed, we believe, to Filippo Lippi, but there is small intrinsic evidence to support the attribution. It is, however, a most exquisite example, recalling by the tender beauty of the face the type of feminine character that may be found in some of the later frescoes by Filippino Lippi. But, whoever may have been the author of the work, there is enough in the face alone with its drooping eyelids and tenderly-closed lips to proclaim the hand of a veritable master. A small picture of *Apollo and Daphne*, by Pollaiuolo, is also to be reckoned among the interesting works of the collection, which includes besides a large replica of the Bridgewater Madonna of Raphael, said to be by Innocenzo da Imola, and an idyllic scene assigned to Giorgione by its former possessor. This last-named work has considerable attractions of colour, and there are two figures in the centre of the landscape that are grouped with some power of expression in design, but we may

conclude from the position it occupies on the wall no less than from an examination of the picture itself, especially in all that concerns the drawing of the principal figures, that the Director of the gallery does not claim for it more than the attention due to an interesting example of the school. Among other Italian pictures is a large portrait of a man with a red head-dress, formerly attributed to Sebastian del Piombo; several examples of Canaletti, one of them a masterpiece in its kind, representing the procession of Maundy Thursday, with a crowd of brilliantly-dressed figures painted in by Tiepolo; and a carefully-arranged composition graced with the name of Paul Veronese. We may mention some of the chief examples of the other schools in the order in which they are arranged upon the walls. Starting from the right-hand side of the door leading to the new galleries are two examples of Ruysdael, the larger of which is a masterpiece in its kind. There is a grand movement in the clouds, and a corresponding variation of tone in the landscape, with here and there a gleam of sinister sunlight breaking the sombre colouring of the scene. On the other side of the room there is a third example of Ruysdael, small in size but very exquisite in quality, of a group of trees massed against the sky. A large landscape by Hobbema, not so simple or original in composition as the one in the Peel collection but no less delicate in execution, and a large peasant-feast by Teniers are the principal features that remain to be noticed on this wall. The latter of the two used commonly to be regarded as a repetition by the master of a picture of the same subject in the possession of the Duke of Bedford; but it is now discovered that the picture bequeathed by Mr. Wynn Ellis is dated three years earlier, so that the Duke of Bedford's picture must be regarded as the replica. On the next wall we have two large rustic subjects by the elder Teniers, a fine portrait attributed to Vandyck, and a carefully-finished architectural study by Dirck Van Deelen, a master but little represented in public galleries. There is also a very perfect little half-length portrait, probably by Mabuse, and two examples of Greuze of more simple sentiment than is common with this master. A stag-hunt by Wouvermans serves to lead the way to the third wall, which is rich in examples of Cuyp. The National Gallery has made choice of three pictures by this master—one a magnificent example, with four cows couching on the grass and a peasant woman engaged in emptying the milk into the large copper vessels. This picture, both in the simplicity of its design and the force of the execution, bears a stronger impress of nature than is to be found in all of Cuyp's pictures, though it shares with them all the characteristic beauties of distributed sunlight sustained throughout the entire composition. The prominence of the cows, which are of larger scale than usual, gives unusual richness to the general scheme of colour. Further on we come to a very beautiful example of Claude, a good Van der Velde, and an admirable view of quiet sea with shipping by Jan Van de Capella, while as a worthy conclusion we have a truly exquisite portrait of himself by Memling. The remaining wall is occupied by various works, including a large landscape by Both, and a fine example of Metsu.

ART SALES.

MESSRS. CHRISTIE, MANSON, AND WOODS had three china sales last week, containing many specimens of great interest. From the prices given for the Oriental china, it would appear to be regaining its proper value. The sale of the 21st ult. contained the small but valuable collection of the late Mr. Mainwaring. A Chelsea plate, with flowers on gold ground, sold for 24*l.*, and a vase, 9*½* in. high, turquoise ground, with grapes in relief, 62*l.* A number of Dresden animals and

birds sold for high prices: a bird and squirrel on a tree, 25 gs.; a pair of birds on trees, 68 gs.; pair of swans, 80l.; cock, 75l.; harlequin and pug dog, with branches for lights, 58l.; and a pair of Louis XVI. wall lights, with Dresden flowers, 95 gs. A Sèvres dessert-service, given by Napoleon I. to his mother, gros-bleu ground, with flowers and butterflies in medallions, 200 gs. Urn-shaped vase, turquoise ground, with pastoral scene after Boucher on one side and flowers on the other, 890 gs. But it was to Oriental china that Mr. Mainwaring gave his special attention, and some of the jars and dishes were of unusual size and extreme beauty. Fourteen plates, with crimson and black borders, ranged in prices from 23 to 30 gs. the pair; a fine dish, enamelled with flowers and landscapes, in brilliant colours, 22½ in. diameter, 122 gs.; and another, with a row of medallions of kyilins round the central ornament, 22 in., 180l.; an old Japan dish, 19½ in., with bustard and hawk in gold and fan-shaped ornaments, 128 gs.; pair of Japan bowls, 146 gs.; blue bowl, mounted in ormoulu, 90 gs.; pair of large jars, enamelled with flowers and figures and ormoulu mountings, 280 gs.; another, 100 gs.; a pair of oviform vases, with flowers on black ground, enamelled with foliage, and medallions of flowers and poultry, 305 gs.; another, also on black ground, with white trellis ornaments in high relief, with medallions of flowers, 250 gs.; a pair of jars, 4 ft. 6 in. high, deep-blue ground, with large medallions of birds and flowers in brilliant colours, 420 gs.

On the 22nd ult. was sold the collection of Mr. Dunn Gardner and others. Pair of Chelsea candlesticks, fox and grapes, and death of fox, 29l. 10s.; plates, with exotic birds and deep blue border, 30l. the pair; two-handled cup, pink ground and birds in medallions, 51l.; a cup, deep-blue, with Chinese children in medallions, 46l. Palissy ware obtained little favour: dish, subject Abraham's sacrifice, 16l.; tazza, Perseus and Andromeda, 17l.; oval dish, Flora, 15l.—all three from the Bernal sale. Luca della Robbia, the Virgin and Child, white on blue ground, 16½ gs.; two Louis XIV. chased ormoulu chandeliers for eight lights, 65l. 10s. each. Belonging to different owners were: oval miniature in ivory, by Cosway, of Georgiana, Duchess of Devonshire, 315 gs., and enamel, by Bone, of her mother Countess Spencer, 47 gs., both authentic, having been given by the Countess to the well-known authoress, Mrs. Trimmer; a lady, by Cosway, 70 gs.

On the 23rd ult. were sold the decorative objects of the late Comte de Jarnac, removed from Thomas-town Castle. Two Oriental cisterns of unusual size, one deep-blue ground with curious domestic scene of figures and children in medallions, and the inside enamelled with fish, 101l.; the other smaller, on white ground, red fish inside, 120 gs.; old Sèvres vase and cover, 16 inches high, green ground, with cartouches and painting after Berghem, a band of turquoise knobs round the mouth, 1,000 gs.; a Sèvres vase and cover, 12 inches high, gros-bleu, of oval form, with white and gold strap-handles and raised festoons of gilt foliage, medallion after Berghem, 1,250l.; flat vase, with heartseases in pale-blue *œil de perdrix* borders, and raised turquoise ornaments, 43 gs. There were also—a different property—pair of Sèvres tulip-shaped vases, 7½ inches high, the neck and feet rose du Barry, the bodies white, with sprays of flowers and spiral rose du Barry and gold flutings, given by Louis XV. to Hyder Ali, and taken at the siege of Seringapatam, 1,500 gs.; an old Chelsea service, with bouquets of flowers and white and gold scroll-pattern borders, painted with birds,

by no less a person than himself. It is several years later than the National Gallery portrait, and is far bolder and more vigorous in style. The painter is represented as holding in his hand a palette splashed with colours; his massive face looks straight out of the picture under a waving mass of hair; there is no background but cloud and sky. The history of the portrait is as interesting as itself. It was painted by Turner for Miss Day, of Bristol, to whom he was engaged to be married. This lady kept it all her life, and when she died at a ripe age it passed into the possession of a Rev. Mr. Llewellyn, from whom, or from its next owner, it was bought by Mr. John Collic, of Clifton, whose it now is. That the story is not too good to be true is proved to the satisfaction of most persons by the written testimony of Mr. Ruskin (which Mr. Palmer is glad to show to any one), that "this picture is unquestionably Turner, unquestionably by himself." The National Gallery ought to buy it; or, failing that, some one who owns a gallery not likely to be sold at Christie's. The price asked is moderate.

A PARAGRAPH of the ACADEMY's, in reference to a "knock-out" at Christie's, on the sale of the Hume collection of Rembrandt's etchings, appears to have been misunderstood. There was, of course, no intention to charge the majority of English dealers of repute with joining in that disreputable undertaking. Indeed, report, which may probably be relied on, says that only one London dealer of known position joined in the "knock out," which was mainly supported by some foreign brethren in the trade.

MR. ARTHUR ARNOLD requests us to state that Mr. Woolner, R.A., has nearly completed the full-size model for the statue of John Stuart Mill.

AN exhibition of works in black and white is now being held at the galleries of M. Durand-Ruel in Paris. It will remain open until July 31.

IN the first weeks in August the Union Centrale des Beaux-Arts appliqués à l'Industrie will, as we have already announced, open an exhibition illustrating the history of tapestry. We understand that the examples collected will be very numerous and of the highest artistic interest.

COMMENTING upon the present fashion of erecting statues in honour of public characters, a writer in *L'Art* recalls the origin of the practice. The first statue raised in France in honour of a private citizen was that to Descartes at the end of the last century. Previously the honour of reproduction in marble in public places had been exclusively reserved to the kings, but in 1775 Louis XVI., recognising the absurdity of this rule, decreed that every two years four statues of eminent persons might be erected. This measure excited a lively interest at the time, and aroused considerable discussion as to the individuals most worthy of the honour. After Descartes, Fénelon was selected; and Voltaire and Bossuet followed.

M. FELIX DUPUIS is now exhibiting at his studio in Fitzroy Street a collection of his works in the department of history, portrait and landscape.

ON July 10 Messrs. Sotheby, Wilkinson and Co. will offer for sale a small but interesting collection of the engraved works of the Early German and Dutch masters. The catalogue states that the plates are "duplicates from a celebrated public collection," and we believe we are not doing wrong in saying that they are from the Fitzwilliam Museum at Cambridge. Israel van Meekenen, Martin Schongauer, Albrecht Dürer, and Lukas van Leyden, are among the masters represented.

A PLEASANT "Exhibition of Paintings on China, Plates and Plaques, of original designs, by Artists and Amateurs," has been got up at Messrs. Howell and James's Art-Pottery Galleries, 5 Regent Street. Prizes and medals were offered,

to be adjudged by the painters Messrs. Cooke and Poynter; several hundred works came in in competition, and a selection of them is now on private view. This arrangement will last till July 15, after which admission will for a short while be allowed upon presentation of address-card. It is suggested by Messrs. Howell and James, and very truly suggested, that painting of this kind would be a means "of employing profitably the artistic faculties of ladies and gentlewomen." The recipients of prizes are (among professional candidates) Miss Linnie Watt (chief prize of 15l. 15s.), Mrs. Sparkes, Misses E. Turck, Faulkner, C. H. Spiers, Edith Cowper, and Butler, and Messrs. Ryland, Slater, Holiday, Gravier, Ellis, and Day; and (among amateurs) Mrs. George Stapleton (chief prize of 10l. 10s.), Lady Rawlinson, Mesdames Wilbraham, A. H. Lee, and Lawley, Misses M. E. Crawhall, Cosserat, Vivian, and F. E. Jameson, Messrs. Rogers and Crawhall, Jun., and Sir Richard Brooke. Thus, it will be observed, both of the chief prizes have gone to ladies. In the case of the amateur, Mrs. George Stapleton (yellow azaleas on brown ground), we should be little disposed to dissent from the award. We may not, however, say as much for the professional lady, Miss Linnie Watt: for, without disparaging the very considerable skill of her prize-work (a landscape with figures), we cannot hesitate to say that neither in style of design nor in executive appropriateness does it match some other less favoured specimens—in especial, *The Arts, Poetry, Painting, Architecture, Sculpture, and Music*, by Mr. Holiday. But doctors will always differ; and a sheep's-eye turned towards a lady's contribution is a venial obliquity of vision. We observe agreeable, and sometimes excellent, specimens from Misses J. Merry and C. A. Lee, the Hon. Mary Henniker, and Messrs. Shepherd and Charranton: many others might be named with hardly less claims. Lambeth Faience, of which numerous examples (not forming part of the present exhibition) are to be seen at Messrs. Howell and James's, shows forth to great advantage, and reflects real credit on the country as a producer of art-manufacture.

AT South Kensington, amid the costly and dazzling splendours of the Prince of Wales's collection, may be observed some of the water-colour sketches taken during H.R.H.'s tour by Mr. Sydney P. Hall. Figure-subjects are numerous among these sketches, and they are not seldom agreeable in colour and generally spirited.

MR. MATTHEW NOBLE, one of the few English sculptors who have gained a high position in art, died on the 23rd inst., at his house in Bruton Street. He was born in 1820, and at an early age acquired a certain distinction in his profession. One of his first commissions was for the Manchester "Wellington Monument," inaugurated in 1856, for which his design of a colossal statue of the Duke standing on a granite pedestal, around which were grouped four figures personifying Wisdom, Valour, Victory, and Peace, gained the award over many competitors. Other of his early works were: a monument in Ashley Church, Staffordshire, typifying Life, Death, and Resurrection; a fine statue of Dr. Isaac Barrow, in the chapel of Trinity College, Cambridge; and a statue of Lord Canning, executed in 1864 for the City of London. Among his more recent works may be mentioned the statue to Sir John Franklin in Waterloo Place, the statue of the Queen executed for St. Thomas's Hospital, and the statue of the late Lord Derby recently set up in Parliament Square. Mr. Noble was a constant exhibitor at the Royal Academy, although he never gained any of its honours. He has two portrait busts in the present exhibition.

ACCORDING to the latest official report of the German excavations at Olympia, it appears that a series of forty photographs, including all the most important pieces of sculpture and architecture,

NOTES AND NEWS.

MR. PALMER, of Duke Street, St. James's, has now in his possession an extremely interesting portrait of no less a person than J. M. W. Turner,

along with views of the ruins, will be in the hands of the booksellers for general sale in a week or two. Moulds have been made from all the chief pieces of sculpture, and are no doubt by this time in Berlin, where we are assured that no time will be lost in preparing casts from them for sale to museums, or other institutions where they may be desired. It is hard that the want of space at the British Museum renders impossible the exhibition of such casts there in the one place of all others where they could best be judged by comparison with other Greek sculptures. Up to now these excavations have yielded results which cannot but be regarded as a splendid justification of the enterprise, and while the public interest in them continues it should not be forgotten that Germany has done all this from the simple and pure love of Greek art, with no wish to carry off whatever was found, and no desire but to find, and so to extend our knowledge.

THE Royal Austrian Museum for Art and Industry has just published a photolithographic facsimile edition of Wilhelm Hoffmann's *Pattern-Book of Lace* (*Spitzen-Musterbuch*), taken from a copy of the original work in the possession of the museum. The plates contain a series of designs for lace-work, extending from simple running patterns to the most elaborate decoration with flowers, birds, and fantastic animal forms. The writer of the preface to the present edition points out several patterns that have an Italian and especially a Venetian character, but these are exceptions. The general style of the designs is thoroughly German, and many of them are applicable not only to lace-work but to embroidery of all kinds, and even, as the author points out in his title-page, to "wood-carving, stone-carving, and other artistic work." Hoffmann's original book, published in 1807, is now extremely rare. Mrs. Bury Palliser does not even mention it in her *History of Lace*. Its republication will, therefore, be very welcome to students of the subject, as well as useful for the practical instruction of those who are engaged or interested in this branch of art-industry. It is published in quarto form, for the small sum of one florin eighty kreutzer, by the Austrian Museum at Vienna.

TEN large cases, filled with a magnificent collection of Peruvian antiquities, have, according to the *Chronique*, just arrived at the Louvre. They are sent by M. Charles Wiener, an Austrian explorer, and are addressed to the Minister of Public Instruction. Among the principal objects are large vases ornamented with symbolic figures, tablets covered with inscriptions, monstrous idols, and other similar antiquities.

THE number of entries by payment at the Salon this year is stated to be 55,000 more than last year.

M. CLÉMENT DE RIS, a well-known art-critic, has been appointed Conservator of the Museum of Versailles, in place of the late M. Eudore Soulié.

M. CHARLES BLANC, the eminent art-critic and historian, has lately been elected a member of the French Academy. M. Charles Blanc is well known to English as well as to French students of art by his eloquent teaching of the philosophy of art and his clear enunciation of its principles. His definition of art as "the interpretation of Nature" is about the most concise, and at the same time the most profound, exposition of the nature of its office that any teacher has set forth. M. Charles Blanc, who has been from the first one of the most constant contributors to the *Gazette des Beaux-Arts*, is at present continuing in that journal his *Grammaire des Arts du Dessin*, published in 1867, by a series of chapters on "La Grammaire des Arts Décoratifs." In the last two numbers he has treated of the decoration of vases with his usual clearness of view. His election to the Academy completes the number of its members.

THE STAGE.

MR. BUCHANAN'S *Corinne*—brought out at the Lyceum on Monday—is not a satisfactory play, for it promises in the first act more than it performs in the last. Among the ills of the pre-Revolution period in France Mr. Buchanan considers as worthy of illustration the denial to an actress of the right of decent sepulture and of the right of marriage. *Corinne*, the actress, who fails to be married in the second act, is introduced to us, in the first, mourning over a professional sister who has failed to be piously buried. These are the especial wrongs for which our attention is besought. But there are really very considerable grounds, not only for sympathising with *Corinne*, but for liking her. She is an honest artist, and she dislikes receiving gifts from wealthy and priestly strangers almost as much as Mr. Buchanan, it would appear, dislikes receiving criticisms from the newspapers. He has gone, it may be, rather out of his way to make *Corinne*, in the eighteenth century, express her slight estimation of dramatic criticism; but, if the fitness of the episode in which she expresses this opinion may be questioned, her refusal of gifts that carry an ignoble meaning is of assistance to the interest of the drama. It leads to her making an enemy of her vicious would-be lover, the Abbé de Larose; and the enmity of the Abbé leads to the denial of the right to be married. Thus *Corinne* and her once honest lover, Victor de Beauvoir, come to be divided. He is eventually false to her. The Revolution comes, and he—an aristocrat—is to be swept away. Only by a clever ruse of *Corinne*'s can he be saved. She saves him, but dies of disappointed hopes and violent emotion. Among the other characters are, on the one part, the relatives of Victor, who express a horror at the thought of his union with an actress, and, on the other, Raoul, the brother of *Corinne*, who expresses a horror at the thought of her union with an aristocrat. The character of Marat, too, is introduced, and he is sketched not without vigour and precision. But otherwise the characters, save *Corinne* and the calm ruffian of the piece—the Abbé—are but little individualised, and they gain little help—it may be, even little justice—from the actors who interpret them. Raoul, the revolutionary brother of *Corinne*, is at best an embittered and disagreeable personage, but Mr. Forrester, with the deep bass voice that the gallery recognises as inevitably belonging to such a character, does not assist us to find in him many natural qualities. Altogether, after the first two acts, the play drags, except, indeed, towards the very end, when the clever contrivance of *Corinne* in apparently denouncing to the infuriated mob the lover whose life she is plotting to save has a genuine if brief interest. Moreover, another moment in the last act is made noteworthy by the acting of Mr. Forbes Robertson, who illustrates the demeanour of the Abbé de Larose before the tribunal in the prison of the Abbaye. But generally the more dramatic or romantic situations of the play—the last two acts in the main—suffer much from the performers, and *Corinne* herself will perhaps have to be impersonated by an actress capable of giving individual expression to scenes of high emotion before it can be definitely said that Mr. Buchanan's play falls off as much as it appears to do. Mrs. Fairfax, who plays *Corinne*, makes a most favourable impression in the earlier acts with a pleasant face, a sympathetic voice, and a very graceful bearing. The quietude and self-control of her refusal of the Abbé and his indignities is wholly praiseworthy; but for the passion of the later acts this lady is, as yet, quite unprepared. The other ladies appear as representatives of the French aristocracy, with no distinction of manner whatever. Victor is not a part that suits Mr. Charles Warner, who should return to the domestic comedy, in which his qualities are of service.

MDME. THÉO has been playing this week at the Opéra Comique in *Madame L'Archiduc*. She has not much voice, nor much power of characterisation in acting; but as her own personality pleases her admirers so much, she might doubtless ask why she should be expected to pass outside of it. Mdme. Théo is a lively and pretty person, who fills the stalls of a theatre when a long dinner is well over. She has wit of a kind for the *boulevardiers* who can understand it, and for the fashionable public she has that which does as well as wit—the reputation for it.

At the Royalty Theatre, this week, *Gavaut, Minard, et Compagnie* has been played, but as we write the theatre is announced to be closing.

MR. IRVING'S benefit on Friday in last week was, of course, fully attended, but the one night's performance of *King René's Daughter* does not call for detailed criticism. On Saturday Mr. Irving appeared as Hamlet, and said a few words to the audience at the end of the play. He went much into statistics, but the most gratifying announcement he made was to the effect that after December next, when he and Miss Bateman will reappear at the Lyceum, he will undertake the impersonation of Louis the Eleventh in Mr. Boucicault's revised version of the great play by Casimir De la Vigne. He will also play Richard the Third.

MUSIC.

VERDI'S "AIDA."

BY the production of Wagner's *Tannhäuser* last month at the Royal Italian Opera, Mr. Gye redeemed one of the chief promises of his prospectus. He has now fulfilled a second—one which for average opera-goers (whatever may be the case with musicians) would probably be even more attractive and interesting—by bringing forward on Thursday week, the 22nd ult., Verdi's latest opera *Aida*.

It would be difficult to imagine two styles of composition more widely differing from one another than those of the great German and Italian masters, who may unquestionably be termed the two most distinguished living writers for the theatre. Let any one compare *Lohengrin* with the *Trova-tore*, and he will see at once that the two works have scarcely a point of affinity. Each is in its own way a masterpiece; but they are constructed upon such different systems as to belong to entirely separate departments of art. In *Aida*, however, the influence of Wagner's music upon Verdi is to some slight extent perceptible, though I cannot help thinking that this influence has been considerably over-estimated by some writers. It is confined chiefly to the occasional employment of the system of "Leit-motive" which plays so conspicuous a part in Wagner's recent works. Verdi does not use them to the same extent; but in the course of the opera there are to be found some examples of their introduction with an evident dramatic intention, reminding us of *Lohengrin*. On the other hand, though the movements are frequently continuous, instead of being divided by pauses, the conventional operatic forms are neither given up nor essentially modified. We meet with the customary airs, duets, finales, &c., and also (though to a less extent than in some other operas) with frequent repetitions of the text.

Aida was written for the Viceroy of Egypt, and was first produced at the opera in Cairo, on December 24, 1871. It was given at Milan early in the following year, and has since made its way to all the principal theatres of the Continent. Among other places at which it has been heard may be named Vienna, Berlin, Hamburg, St. Petersburg, Moscow, and Paris, its first performance in the last-named city having preceded that at Covent Garden by exactly two months.

There can be no doubt that the composer, in the choice of his subject, has been influenced by the circumstances under which the opera was written. The libretto was at first in French, and the work of M. Du Locle; but the Italian version in which it has been performed is from the pen of M. Ghislanzoni. Before proceeding to speak of the music, it will be desirable to give an outline of the plot.

The action of the opera takes place in Egypt, and at its commencement we find that Aïda, the daughter of Amonasro, King of Ethiopia, has been captured by the Egyptians and is a slave in attendance upon Amneris, the daughter of the King of Egypt. She is beloved by Radames, the captain of the King's guards, and returns his passion. Matters are complicated by the fact that Amneris herself is secretly in love with Radames; and the rivalry of the two women is the main-spring of the action. News arrives of the invasion of Egypt by the Ethiopians under Amonasro, and Radames is appointed commander of the Egyptian forces. Amneris, who suspects that in her slave she has a rival, determines to discover whether her suspicions are well grounded, and therefore falsely informs Aïda that Radames has fallen in battle. The young girl's anguish, and her subsequent joy when the Princess tells her that she was merely testing her, reveal her secret; and from this moment Amneris resolves to crush her rival. Meanwhile Radames returns victorious, bringing with him Ethiopian prisoners, among whom Aïda recognises her father, disguised as an officer. It should be said that the Egyptians are not aware that their captive is the daughter of the Ethiopian king. At the request of Radames, the prisoners are set at liberty, but Aïda and her father are retained as hostages. The King, moreover, gives the hand of Amneris to Radames, whom he designates as his successor on the throne. The young general, though unwilling to accept, dares not openly refuse the proffered favour.

At the beginning of the third act, which takes place by moonlight on the banks of the Nile, Amneris, attended by Ramphis, the chief priest, comes to the temple of Isis to pass the night preceding her wedding in prayer. As soon as she has entered the temple Aïda comes stealthily forward: she has an assignation with Radames at the same place. While she is waiting for him she employs her time, according to the manner of *prime donne* in general, in singing about the "cieli azzurri," "verdi colli," &c., of her native land. To her enters, not the lover whom she awaits, but her father, who has discovered her secret, and endeavours to persuade her to use her influence over Radames to induce him to divulge his military plans. Aïda recoils from the suggestion, but ultimately, when threatened with her father's curse, consents. Radames is now seen approaching, and Amonasro conceals himself. The young general implores Aïda to fly with him, and, quite unaware of any treachery, reveals the road to be taken by the army, in saying that they can escape that way, as it will be deserted till the morrow. Amonasro comes forward and declares himself, and almost at the same moment Amneris comes out of the temple, and on seeing Radames accuses him of having betrayed his country. The priests rush forward to seize all three. Radames surrenders at once, but in the confusion Amonasro and Aïda escape.

In the last act, Radames is in prison awaiting his trial. Amneris, torn by conflicting emotions, is willing, if possible, to save him, and in an interview with him offers to do so if he will promise to renounce Aïda. The young general firmly refuses, and is led off to trial. When asked by the chief priest to defend himself, he preserves an obstinate silence, and is consequently condemned to be buried alive beneath the altar of the offended deity. The final scene shows the stage divided into two parts; above we see the temple of Vulcan, resplendent with gold and light; we hear the hymns of the priests and

priestesses, while Amneris is kneeling in despair against the stone which closes the entrance to the subterranean dungeon. The lower part of the stage shows the dungeon itself. Radames is there awaiting death, and Aïda, who has secretly made her way there also, has come to join him. Their farewell songs blend with the hymns resounding above, while Amneris breathes a prayer for the dying warrior.

It will be seen from this outline of the libretto, that, while not equal to those of Wagner, or to the best of Scribe or Jules Barbier, the poem of *Aïda* is by no means deficient in good situations. The charge has indeed been brought against it, and not without justice, that the passion is continually at too high a tension. Aïda herself is in trouble throughout the whole work, and Amneris is constantly raging under the pangs of jealousy and unrequited love, to which in the last act are added the tortures of remorse. This is no doubt true; but from a musical point of view we ought scarcely to complain, because it is in depicting the more violent passions that Verdi excels, and some of the most striking movements of the present opera are those in which the mental emotions are most strongly portrayed. Such are the great duet between Aïda and her father in the third act, in which Amonasro urges his daughter to discover from Radames the plans of the Egyptian troops, and the scene in the last act in which Amneris implores the priests for mercy on Radames, whom they have condemned, and when they turn a deaf ear to her entreaties, invokes the vengeance of heaven upon them. In other parts of the work the composer appears more conventional. Radames' romance in the first act, "Celeste Aïda," while full of genuine Italian melody, and written most gratefully for the singer, has a strong family likeness to many other operatic tenor songs; and the martial chorus, "Su del Nilo al sacro lido," though possessing the quality of tunefulness in an eminently "ear-catching" degree, is also somewhat commonplace. Our space will not allow a detailed notice of each number of the work; among the best pieces, in addition to those already specified, may be named the duet in the first act between Amneris and Radames, with the succeeding trio in which Aïda also takes part, the passionate duet between Aïda and Amneris in the second act, in which the princess discovers that her slave is her rival, and the entire third act, which must, as a whole, be pronounced the finest of the four. The finale of the second act—the most elaborate piece of concerted music in the opera—should also be mentioned, though more for the skill of the workmanship than for the intrinsic value of the musical ideas. This part of the work is somewhat suggestive of the style of Meyerbeer.

One feature of the music remains to be noted. With a view, doubtless, of giving "local colour" to the opera, Verdi has employed in the hymns of the priests, and also in the ballet-airs introduced in the first and second acts of the work, some peculiar and unusual forms of the scale. In these movements we find the second degree of the scale flattened, and sometimes also the sixth and seventh degrees. Whether or not this is a genuine peculiarity of Egyptian music, I have not been able to ascertain. The effect is curious, even *bizarre*, especially in the invocation of the god Phtha.

The cast of the work, as presented at Covent Garden, could hardly have been improved. Mdme. Patti, as Aïda, added another to the long list of triumphs with which her name is associated, and both in singing and acting showed herself fully equal to all the demands made upon her. As Amneris, Mdle. Gindele, from Vienna, appeared for the first time in London. This lady has a fine mezzo-soprano voice, and an excellent style, and is moreover an admirable actress. Signor Nicolini, one of the best tenors of the Covent Garden company, was highly efficient as Radames, and the parts of Amonasro, the King, and Ram-

phis, the chief priest, were excellently sustained by Signor Graziani, M. Feitlinger, and Signor Capponi. The *mise-en-scène* was one of the most brilliant that has been seen even under Mr. Gye's management, the scenery, by Messrs. Dayes and Caney, being particularly beautiful.

Of the final position which *Aïda* is likely to take among its composer's works it would be premature to hazard an opinion. While from a purely musical point of view it can hardly be considered equal to some of its predecessors, it surpasses many, if not most of them, in dramatic appropriateness, and is in this respect so far in unison with the tendencies of the present day that it is quite possible that for this reason it may hereafter be ranked as one of its author's masterpieces.

EDENEZER PROUT.

THE ninth of the present series of Philharmonic Concerts, which was given last Monday evening, was of fair average interest, though containing no absolute novelty. The chief feature of the evening was the reappearance, after an interval of five years, of Mdme. Bodda-Pyne—formerly Miss Louisa Pyne, and well known as one of our best vocalists, both in the concert-room and on the stage. Her voice appears to have deepened, for, instead of a soprano, she now comes before us as an alto singer. She selected on Monday night Handel's "Lascia ch'io pianga" and "Ah quel giorno" from *Semiramide*, and was received with a warmth which showed that our English public had not forgotten an old favourite. The other singer on Monday was Mr. Edward Lloyd, who did well to bring forward the lovely song "Golden days, again O win me," from Brahms's *Rinaldo*, which, it is needless to add, he sang charmingly. Herr Leopold Auer, a distinguished Hungarian violinist who has several times previously performed in London, was the instrumental soloist of the concert. He selected Max Bruch's violin concerto, last played here two years since by Herr Straus. Herr Auer gave an excellent reading of the work, which, however, is probably more interesting to play than to listen to. It is showy for the solo instrument, but as a whole decidedly dry. The orchestral works produced on this occasion were Beethoven's symphony in C minor, Mendelssohn's *Meeresstille* overture, and Wagner's prelude to *Die Meistersinger von Nürnberg*, which last work needs for an adequate performance more rehearsal than it seems possible to obtain for a Philharmonic Concert. The last concert of the season is announced for Monday week, when Mdme. Essipoff is to play Chopin's concerto in E minor, a work in the rendering of which she has few equals.

MDME. ESSIPOFF's only recital during the present season was given at St. James's Hall on Thursday week last, before a very appreciative, but not a very large, audience. Indeed, Rubinstein's visit to London seems to have acted most prejudicially on the success of all other pianists for the present, and his extraordinary playing has thrown that of all other artists into the shade. On no other hypothesis can the comparative thinness of the attendance be accounted for, as Mdme. Essipoff is an established favourite here. We have so often enlarged in these columns upon her remarkable talent that it is needless to dwell upon the subject now. It will be sufficient to say that her playing was as fine as on previous occasions, and that her programme included pieces by Beethoven (Sonata, Op. 53), Schumann, Rubinstein, Bach, Hässler, Rameau, Schubert, Mozart, Chopin, and Liszt.

MR. JOHN THOMAS, one of our best harpists, gave a concert at St. James's Hall on Thursday week last, as briefly mentioned in our last issue, when, in addition to his own cantata *Llewellyn* and a miscellaneous selection, he brought forward an interesting novelty. This was an unpublished concerto by Mozart for the unusual combination

of flute and harp, with orchestra. We learn from Jahn that the work was composed at Paris in 1778 for an amateur, the Duc de Guines, and his daughter, the former of whom Mozart described as an incomparable flute-player, and the latter as a magnificent harpist. The Duke commissioned the composer to write for the two instruments which, curiously enough, were Mozart's special abhorrence. The work, which is accompanied by a small orchestra of strings, oboes, and horns, is written in a light and graceful style, well adapted to show off the solo performers, and accompanied with Mozart's invariable tact; it cannot, however, be called one of his best compositions. The harp part was admirably played by Mr. Thomas, and the flute could not have been in better hands than those of Mr. O. Svendsen.

THE Senate of the University of London has decided to adopt the report of the Committee of Convocation recommending the prayer of the memorial of Trinity College, London, in favour of the conferring of musical degrees by the University, on the basis of the ordinary matriculation examination. A committee will shortly be appointed to prepare the scheme of the examinations for the respective degrees of bachelor and doctor in music.

WE regret to announce the death of Mr. J. W. Thirlwall, for many years a well-known and highly esteemed member of our principal London orchestras, at the age of sixty-seven.

A SUM of 10,000 francs has been voted by the municipal council of Paris on the motion of M. F. Hérod, for the encouragement of symphonic and choral composition. A special committee is at present engaged in arranging the programme of the competition for the prize.

MDME. NILSSON and her countryman, Herr Conrad Behrens, will make in the autumn a tour with an operatic company in the principal towns of Sweden and Norway. Madame Nilsson has never been heard in her native land since she left it to pursue her musical studies in Paris.

THE current number of the *Neue Zeitschrift für Musik* gives some interesting particulars as to some of the internal arrangements of the Bayreuth theatre. It was at first contemplated to have special gas-works erected for the theatre, but as the Bayreuth gas company has promised during the performances to supply gas of extra illuminating power, the original idea has been abandoned. Full details of the lighting arrangements are given in the paper, and it is stated that the stage alone will require 3,246 jets! In addition to this, Wagner's work demands extraordinary scenic effects, such as rising mists, gathering clouds, &c. For these, two large steam-engines are placed at a short distance from the theatre, the steam from which is carried by pipes to a reservoir placed under the stage, from which it can be distributed by a network of tubes over the whole stage. By means of a special apparatus this vapour will be rendered as dry as possible. Every possible precaution has been taken against fire. In the corner towers of the theatre are two enormous cisterns, each holding about 1,200 gallons, from which water can be obtained at a very high pressure in case of need. A detachment of the Bayreuth fire-brigade will be constantly on duty during rehearsals and performances. The whole of the gas and water works of the theatre have cost the not inconsiderable sum of 120,000 marks (6,000l.).

TO TOURISTS, ARTISTS, AND OTHERS.

JOHN J. ATKINSON,

33 and 37 MANCHESTER STREET, LIVERPOOL,
IS NOW SUPPLYINGA COMPLETE SET OF
PHOTOGRAPHIC APPARATUS,

with One Dozen Prepared Plates, for taking Views 5 inches by 4 inches, the whole weighing but a few pounds with full Instructions for Use. Price £5. Sent free to any part of the United Kingdom on receipt of P.O.O.

Studies from Nature made by Photography are invaluable to the Artist; save time, and are more useful for future reference than hastily-made sketches. The Tourist will add to his pleasure in being able to secure truthful records of his rambles. Every requisite in Photography. GALVANIC AND ELECTRIC APPARATUS of all descriptions, BATTERIES, CELLS, CLAMPS, AND BINDING SCREWS supplied; for particulars of which send Twelve Stamps for Illustrated Catalogue.

HORNE'S POMPEIAN DECORATIONS.

ROBERT HORNE,
HOUSE DECORATOR AND PAPER-HANGING
MANUFACTURER,
41 GRACECHURCH STREET,
LONDON, E.C.

By Special Appointment to His Majesty the King of Italy.

JENNER & KNEWSTUB'S TRAVELLING DRESSING BAGS, from 2l. 2s. to 50l. See their NEW ILLUSTRATED CATALOGUE (Part I.) of Travelling Dressing Bags, Hand Bags, Waist Bags, Portmanteaux, Trunks, &c., containing a full description of 1,000 articles, and upwards of 100 illustrations so clearly and beautifully engraved from artistic photographs that any article can be selected from the catalogue as readily as from stock. The public are respectfully cautioned against spurious imitations of their manufactures; none are genuine unless bearing the names "JENNER & KNEWSTUB," 33 St. James's Street, and 66 J. myn street, S.W. Cash discount, 10 per cent.

SATURDAY, JULY 8, 1876.

No. 218, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Studies of the Greek Poets. Second Series. By J. A. Symonds. (London: Smith, Elder & Co., 1876.)

THE second series of Mr. Symonds' essays is, in its main scheme, a supplement to the first: there, for instance, we had Greek Tragedy and Euripides and Ancient and Modern Tragedy, here we have Aeschylus and Sophocles and the Tragic Fragments; there we had Empedocles, here we have Parmenides. At the same time, if we were to read the two series together in the order which Mr. Symonds suggests in his preface, we should not find they made quite a homogeneous work. There was an exuberance and richness of feeling and diction throughout the earlier series which in this we only find here and there; the essay on Aeschylus, where it is most sustained, is cold and sober compared with that on Pindar; from most points of view the change is a gain, though we sometimes fancy that the style has been stripped rather than chastened. To judge by internal evidence, several of the chapters have been delivered as lectures, and there are little irregularities which rather interfere with literary finish. It is intelligible that a lecturer should tell his audience what they will find if they read for themselves the book he is describing, but a reader of a popular work prefers extracts to references, and perhaps it has a capricious appearance where in one chapter we have quotations in Greek with English translations in verse, in another, translations in prose and no original at all. The irregularity may of course be accounted for by the predilections of the different magazines in which several chapters have appeared, but on reprinting a uniform plan might as well have been adopted. We should have expected, too, that in the process of revision the writer would have modified such questionable statements as that Hesiod was the poet of the Thetes—who we always supposed were labourers, not yeomen—and that Cleomenes (at least if Mr. Symonds is speaking of the heir of Agis, who fell at Sellasia) was the chief of a military aristocracy. Perhaps, too, the view that the three Theban plays of Sophocles are to be interpreted as a trilogy, though they were not written as one, might have been reconsidered with advantage: for it is really difficult to believe that Sophocles remembered the *Antigone* and foresaw the *Oedipus Coloneus* when he wrote the *Oedipus Tyrannus*. The most that can be conceded is that in writing the *Oedipus Coloneus* he had the earlier plays in his mind and tried to handle the

legendary matter which lay between them so as to form a transition from one to the other. This, after all, is matter of opinion: but one scarcely expects to have to differ from Mr. Symonds on questions of scholarship. Yet surely when Plutarch blames the ἀνωμαλία of Sophocles he is not thinking of "euphuism," or "linguistic irregularity," but of the same fault as Longinus censured when he said that Sophocles, like Pindar, "often strangely lacks the flame of inspiration, and falls most grievously to earth;" nor can we think that when Aristotle called the tragedies of Euripides "unethical," he meant "that they were false to human nature, unscientific, and therefore inartistic." He may have meant that the personages in them have no wholesome human life of their own adequate to the stress of intense situations; but then few people have. A play which deals with such people and such situations may have pathos and dignity, and be as true to nature as a play can be; that character is fate is an optimistic fiction, and, like most optimistic fictions, not a really cheerful one.

In the essay on Aeschylus, the comparison between him and Marlowe is striking and well worked out. And the argument that the *Prometheus Unbound* was really a sequel to the *Prometheus Bound* is as conclusive as can be expected, though nothing is done to make it probable that the apparent error of making Prometheus too nearly in the right would have been corrected in the later play. In the *Agamemnon* the triumph of Clytaemnestra is almost justified, and there is nothing in the *Choephora* or the *Eumenides* to weaken this impression. The essay on the fragments of the lost tragic poets opens with an interesting account of how the fragments of Greek literature have been selected for us; and we may mention, too, a good summary of the school of Aeschylus. There are fine remarks in the chapters on the Comic Fragments on Menander as the Sophocles of comedy, though it is to be regretted that Mr. Symonds has made no use of the Latin writers, by whose help the new comedy might have been less incompletely treated. Such a play as the *Heccyra*, where the characters act uprightly and with good feeling in thoroughly false situations is very suggestive, and an analysis of it would have been at least as instructive as regrets that Athenaeus had not a soul above cookery.

The article on Hero and Leander is beautifully written, and the contrast between Marlowe's method of handling the subject and that of Musaeus is very well put. "He [Marlowe] wants to make his readers feel, not see: if they see at all they must see through their emotion; whereas the emotion of the Greek was stirred in him through sight." This comes near the end of a paragraph in which there are several sentences which suggest that the author is for the moment of Marlowe's mind, according to which "Those that cannot clothe themselves with spirit as with a garment are abandoned." It is recognised that the exquisite poem of Musaeus belongs to the old age of Greek art (Mr. Symonds uses a stronger expression which one shrinks from quoting), and that the ripe wisdom of the gentle Menander belongs to a

period of senescence. This suggests a general observation which deserved more consideration than Mr. Symonds appears to have given it. Greek art was the outcome of Greek life: it grew with its growth and faded with its decline. Music and Gymnastic fostered both up to the point at which both were stimulated and then poisoned by Dialectic. Obviously this has an important bearing on the question of how much guidance we can expect from Greece in the perplexing period of transition through which we are passing now—whether we can hope to find light in what we have inherited from Athens, when the light which we inherited from Jerusalem seems to many to be burning dim. Nothing would be more desirable than that we should, if it be possible, "cease to be clairvoyants and become analysts, verifying our intuitions by positive investigation." The misfortune is that this process is not now to be tried for the first time, and hitherto, and notably in Greece, the result of the trial has been to leave no intuitions to verify. The fatal bifurcation between asceticism and hedonism which Mr. Symonds rightly characterises as one of the chief misfortunes of later Greek culture was not a mysterious, unaccountable visitation—it was the ripe fruit of experience gathered as reasonably and patiently as could be expected under simple and favourable conditions. It was not the fault of the Greeks if experience, upon the whole, failed to maintain "a virile and firm confidence in the order of the universe, and in the intellectual faculty of man," if that is all we have to trust. In a primitive community before personal self-consciousness has developed itself, and revealed a long series of separate aptitudes and desires, experience does tell in favour of keeping up the highest known standard, because the good of all is the only known way to the good of each; and, as they cannot yet be contrasted, the leaders of the community persuade all its members whose nature is wholesome in the main to think more of the nobler object of the common striving than of its meaner personal result. But when personality emancipates itself the connexion between well-doing and well-being becomes increasingly obscure; in a fine race very likely the very men who point out how obscure it is raise a gallant protest in behalf of earnestness and high-mindedness, and Mr. Symonds has collected many such protests from Euripides; but the protest is raised for the last time: and then a few rare natures set themselves to live by a transcendental system, strong natures and coarse natures set themselves to live by passion, shrewd natures set themselves to live by interest, average natures settle down to live by temperament, and natures which are rather better than the average profit by experience to be as comfortable as they can without great risks or great efforts, and endeavour under these conditions to cultivate safe kindliness and listless cheerfulness. All is over with a community when the traditions upon which it was nursed fail to reveal new meanings, which deepen to meet new questions, when it can no longer repel Mr. Symonds' advice "above all things to quit delusions, however sanctioned by ancient reverence." "To stand in the old ways and

ask for the old paths" may be a less attractive programme than that of the noble motto which Mr. Symonds has adopted from Goethe, only there have not been more than one or two privileged generations in the life of any known community for whom living *im Guten und im Schönen* did not necessarily preclude living *im Ganzen*. As has been well said—

"Wordsworth's eyes avert their ken
From half of human fate;
And Goethe's course few sons of men
May think to emulate."

It is easier to agree with the introductory essay on Mythology—one of the earliest well-considered protests which have been entered against the school which imagines that Greek mythology is explained when Greek mythical names have been connected with Sanskrit analogues, and Greek ideas traced to an elemental basis. The criticism is thorough, and hardly too severe, considering the curious tyranny which the school has exercised, very likely without intending or desiring it, over the imagination of the literary class for the last twelve or fifteen years. Perhaps when our emancipation is complete we shall be inclined to think that the explanation of a myth, as of every imaginative product, must begin with the recognition of the realities which set imagination a-work. It is a fair retort of a metaphor, upon which a brilliant writer has insisted at much length, that, if mythology is a disease of language, it is as the pearl is a disease of the oyster, and that our concern is rather with the pearl than with the grain of sand upon which it is formed; but, after all, a myth is not alien to the life of a nation as a pearl is alien to the life of an oyster. As Mr. Symonds says, there is a fallacy

"in attributing to the simple and sensuous apprehension of the savage the same sort of simplicity as that which we have gained by a process of abstraction, and consequently inferring that the importation of fancy into the thinking process implies a species of degeneracy. The truth seems rather to be quite the contrary. If we grant, for the sake of argument, that the first thoughts are in a certain sense simple, they have nothing in common with the generalisations of the understanding. Except in relation to immediate perceptions, their generality is empty until it has been filled up with the varied matter of the senses and the imagination. Mythology and poetry are, therefore, an advance upon the primitive prose of simple apprehension. What was a mere round ball becomes a Daedal world; and it is not until the whole cycle of the myth-creating fancy has been exhausted that the understanding can return upon a higher level by abstraction to intellectual simplicity."

In fact, so far from mythology being a disease of language, it is an instrument of progressive thought, and the most that can be conceded to the philological school is that false etymologies and other *eidola fori* played even larger parts in the youth of thought than they play now in what may be regarded as its prime. Even this admission requires qualification; the myth of Prometheus and Epimetheus was not the less fruitful because it originated among men who had forgotten what *Pramantha* meant in Sanskrit. Again, Daphne is probably connected with a Sanskrit word which means the dawn, and does not mean a bay-tree; but when the twilight upon which men project the maiden of their

own yearning vanishes, the worshippers of Phoebus think she vanishes into the gracious thicket, whose outline the sun reveals, whose aroma the sun draws out; upon the bleak uplands of Arcadia, where the morning wind is a great and terrible god, he too pursues down the river valleys a maiden who vanishes when day is up, but what is left is not a bay-tree but a reed. Myths of the Sun differ as well as myths of the Dawn. "The pale and beautiful Balder, who must perish and whose death involves the world in wailing; the radiant and conquering Phoebus, the healing deity, the purifier, the voice of prophecy and poetry and music; Ormuzd, the antagonist of darkness and evil, the object of desire and adoration to the virtuous and pure: these Sun-gods answer to the races, as their geographical position and their spirit made them."

Is it too much to ask that Mr. Symonds' essay may prove the precursor of a complete treatise on Greek mythology? Few English writers are so well qualified for the task by knowledge of what the Greek imagination worked on and what it worked to; in undertaking such a task he would still be continuing his labour of love on behalf of those who cannot read Greek literature for themselves, and he would be doing something for those who can, who, perhaps, feel themselves neglected now.

G. A. SIMCOX.

Sixty-nine Years at the Court of Prussia.
Recollections of the Countess Von Voss.
Translated from the German by Emily
and Agnes Stephenson. In Two Volumes.
(London: R. Bentley & Son, 1876.)

THE story of sixty-nine years of any life, except that of an original thinker, could hardly fail to be wearisome to general readers, and the idea of sixty-nine years of Court life, and especially of German Court life, would strike awe into the hearts of most people.

And yet there is something so pathetic in this graceful old countess—in the sad romance of her early days and the passionate loyalty of her later ones—that we are carried on to the end of the book in spite of the paucity of her recollections. These recollections are spread over part of the reign of Frederick William I., the whole reign of Frederick the Great, as well as that of Frederick William II., and a great part of Frederick William III.

The Court life of Fräulein von Pannwitz began when she was very young. She boxed the ears of the father of Frederick the Great before she was twelve years old, and records that she wore "the deepest mourning of wool and crape for him in 1740;" at the age of fourteen she became lady-in-waiting to his widow, Sophia Dorothea. We are told that a picture of the Fräulein is still to be seen in the royal palace at Berlin, which represents her in "a hunting dress of red velvet, a little three-cornered hat with white plumes on her head, and a gun in her hand; by her side a fine cock of the wood and other game, evidently trophies of a good day's sport." Frederick the Great seems to have had much admiration for the girl, whom Thiébault describes as "tall and

slight, with the form of the huntress Diana, and yet fair and lovely as Venus, as charming, as innocent, and as amiable as she was beautiful." The countess herself naïvely tells how, in 1743, the king had her specially invited to a masquerade, and did her the honour to talk to her. "He asked me, among other things, after my father, who was unwell, and I answered, 'He is better, thank God.'" The king turned round and said, "She is still very innocent, since she can speak of God here."

But the admiration of Frederick the Great was harmless; it was his brother, Augustus William, Prince of Prussia, of whose unfortunate passion the Fräulein says that "it spoiled her whole life and filled it with trouble." The prince was married against his own wishes, when he was scarcely twenty, to a daughter of the Duke of Brunswick; he afterwards gave his whole love to the Fräulein von Pannwitz. "This attachment," she says, "which began almost at the first moment of our meeting, did not pass away as quickly as it had begun; he retained it only too truly and steadfastly till the end." Unfortunately for herself, the young lady-in-waiting could not help loving him in return. She pleads in excuse that "he was very charming, with a fine figure and a handsome face, refined and intellectual; he was very gentle and obliging to me and, above all, was most tenderly attentive." But she "fought a hard battle with herself." It was a matter of course to her that she was to be sacrificed. "What could I do?" she says, "I had no choice. I might not shrink from this sorrow: it must be accomplished." Frederick the Great and her parents arranged that she should marry her cousin, Count Von Voss, and she married him. "Nothing was spared me," she writes pathetically. The prince fell senseless to the ground during the marriage ceremony, and a few years later he died of inflammation of the brain.

The married life of the countess was not happy, and its sadness was increased by the loss of children and the unhappy fate of her niece, Julie Von Voss, whose story was much the same as her own, except that, being of slighter material and less capable of self-sacrifice, she succumbed to fate. She was beloved by the dissolute Frederick William II., the son of the man who had "spoiled the life" of her aunt. The story is told in sad and simple words in the diary of the countess, and the left-handed marriage with the king, and early death of Julie, known as Countess Ingenheim, are matters of history. But "the king could do no wrong;" and in her eightieth year the countess, when looking back on these events, wrote of him: "He was not half so much lamented as he deserved. And yet he was so kind, so true a friend in need, and, if one may permit oneself the expression, such an honourable, upright man!"

After the death of her husband in 1793 the Countess von Voss was appointed by the king to be Mistress of the Household of the Crown Princess, and from that time her life is devoted to her royal master and mistress, who soon succeeded to the throne. Loyalty with her became a passion. The second volume of her *Recollections* is chiefly

occupied with hurried notes of the troubles which "that detestable Corsican, that monster and scourge of mankind," as she calls Napoleon, brought upon her country. When Napoleon came to Tilsit, the countess had to receive him at the foot of the staircase in the king's quarters. She describes him as—

"excessively ugly, with a flat, swollen, fallow face: very corpulent besides, short, and entirely without figure: his great round eyes roll gloomily about, the expression of his face is severe, he looks like the incarnation of fate. Only his mouth is well shaped, and his teeth are good also."

She piously prays, "Merciful God, put an end at last to the life of this dreadful man." The brave old lady nearly loses heart over the vacillation and weakness of the king in these difficult times.

"All, all fails, and never comes to conclusive and intrepid action. Is there anything more miserable for a heart which grieves over the wreck of this kingdom than the sight of this hopeless, wretched despondency? . . . Oh! my God, the only refuge to whom I turn in my tribulation . . . put fresh courage, new hopes and resolutions into the heart of him on whom all depends, and let me, an old woman, before I die hear the answer to my petitions for those to whom I have given my whole life."

She lived long enough to see her beloved king freed from this galling yoke, though she also lived to mourn with bitter sorrow the death of the queen, who seems to have been a noble and lovable woman.

The extreme brevity of the entries in the diary, and the monotony of the Court life recorded, render the second part of the book rather wearisome, but all through it the commanding figure of the old lady stands out clearly before us, "to the last unbent and erect as a taper, the high-heeled shoes, the patches and the powdered hair, which she had worn from her youth, being not unbecoming to her." Part of the rule which she laid down for herself was that—"as regards outward demeanour, the Mistress of the Household should hold her head high and walk erect, should have a courteous but dignified carriage, and bow properly, not, as is done now, with the head only, but with the knees, curtsying respectfully and solemnly, and rising slowly and with dignity."

It is impossible not to sympathise with her when, at eighty years of age, she says:

"I am asked about everything, and nobody follows my advice. They want me to tell them how everything is to be done, and then they think they know better."

She was a religious old lady in her own way, loving sermons dearly, but chiefly intent on praying for the destruction of the French. Her naïve joy at the victory of Benningsen at Pultusk reminds one of the telegrams of later days:—

"Great joy! Benningsen has fought a sanguinary but victorious battle. We were all much affected, and the dear King told it to us in so charming a way that we were doubly moved! Then he told the dear Queen, and she was so pleased! Six thousand men remained dead on the field; he was not able to pursue the enemy."

Thus loyal and devoted, "rejoicing with those that rejoiced, and weeping with those that wept," the old woman lived to the age of eighty-six, being struck by paralysis finally in the middle of her game of whist, and even

then looking back laughingly as she was carried from the room to tell her companions "not to cheat her."

F. M. OWEN.

Annals of the Road; or, Notes on Mail and Stage Coaching in Great Britain. By Captain Malet, 18th Hussars. (London: Longmans & Co., 1876.)

THE taste or mania, whichever one may like to call it, for coaching seems still to be on the increase, and proof of this is to be found, not only in the number of coaches which thread all the high roads leading out of London, or of private drags which assemble by the Powder Magazine in Hyde Park when the bloom is on the chestnut-trees, but in the variety of books dealing with things of the road which have recently appeared. Captain Birch-Reynardson, himself a member of the Four-in-Hand Club, though not a very constant attendant at their meets, has put on record his experiences and souvenirs; Lord William Pitt Lennox, who generally has something to say on all matters appertaining to sport, also comes before the public with a book upon coaching; and Captain Malet, in the work now before us, takes up his parable on the same subject. There may be other and equally interesting treatises on coaching, but the three mentioned are certainly those which have attracted the most notice, though Lord William Lennox's book, be it observed, only appeared last week.

Captain Malet does not disdain the time-honoured practice of "beginning at the beginning," but it is only just to him to say that his reference to the British chariots of which Cicero wished a Roman friend to bring him a pattern is judiciously brief. We all know how slow and gradual was the substitution of carriage-wheels for the saddle as a means of conveyance even for ladies, and the "whirlicotes" made use of in the reign of Richard II. were so rare that two ladies who used them when the king made his grand entry into London "were exposed in a not very decorous manner to the jeers of the multitude." It is an old story, too, how Queen Elizabeth went in state to St. Paul's, riding behind her Master of the Horse; but it was in her reign that the use of coaches became comparatively universal. The convenience of the new mode of conveyance caused it to be adopted by all those who could afford it, and horses were so rapidly bought up for this purpose, and became so exorbitantly dear, that the question was discussed in Parliament whether the use of carriages should not be confined to the higher classes. So far as the price of horses is concerned, we might almost imagine ourselves brought down three hundred years later to the horse-supply question and Lord Rosebery's committee, the principal difference being that in these modern days one of the remedies suggested is not an embargo upon their use at home, but upon their exportation abroad. Stowe, in his *Survey* of the same period, says: "Divers great ladies made them coaches and rode in them up and down the countries to the great admiration of all beholders." And he adds: "the world runs on wheels with many whose

parents were glad to go on foot." This, remarks Captain Malet with great truth, is still the case. The first so-called coach, built by Walter Ripon for Queen Elizabeth, was in reality a mere cart, without springs, covered with an elaborate canopy, and having chairs placed in the bottom of it. What the derivation of the word coach is has, as Captain Malet points out, excited considerable controversy. If derived from the French *carrosse*, or the Italian *carroccio*, it would signify a large car or waggon. Menage insists that it is Latin, and traces it, by dint of special pleading, to *vehiculum*. Junius derives it from *ὄξω*, "to carry," and Wachter sees in it a corruption of the German word *kutten*, "to cover." Others, again, say that it had its origin in the name of the Hungarian village of Kitsee, in proof of which they urge that there was a Hungarian covered carriage in existence in the sixteenth century. The first of these derivations seems the most probable and the most natural, though then it may be asked from what *carrosse* or *carroccio* is derived. These and many similar items of early coaching lore Captain Malet relates as briefly as he can, and he goes on to trace the spread of the taste for travelling in carriages, and the restrictions which James I. placed upon their use. The Duke of Buckingham, in 1619, set the example of being drawn by six horses, upon which the Earl of Northumberland started a coach and eight. This was too much for the thrifty James, who issued orders that no one was to drive more than six horses, the only exception being in favour of the Crown. In 1640, the Dover Road was considered to be the best in England, owing to the extent of Continental traffic, yet even under those favourable conditions the journey between London and Dover occupied three, or even four days. Captain Malet terminates his second chapter by the following quotation from Chamberlayn's *Present State of Great Britain*, which admirably describes the conditions of travel in England during the second and third quarters of the sixteenth century:—

"Besides the excellent arrangement of conveying men and letters on horseback, there is of late such an admirable commodiousness, both for men and women, to travel from London to the principal towns in the country, that the like hath not been known in the world: and that is by stage-coaches, wherein any one may be transported to any place, sheltered from foul weather and foul ways, free from endangering of one's health and one's body by hard jogging or over-violent motion; and this not only at a low price (about a shilling for every five miles), but with such velocity and speed in one hour that the post in some foreign countries cannot make in one day."

It is impossible to avoid the wish that the complacent Chamberlayn could be brought back to revisit the glimpses of the moon, and seated for an hour and a half in the fast express which does the seventy-seven miles between the metropolis and Swindon in that time. He might be a little late—but in that event the speed would be all the greater, and he would of course have to take his chance of an accident, though it may be as well to remark that railways are much safer than coaches. Referring to the casualties which do from time to time occur

on railways, many people contrast them with the safety of the coaching days, but it is time that these notions, opposed as they are to fact, should be got rid of. It would unquestionably be a happy consummation if the present danger of railway travelling could be lessened, but Captain Malet, though he does not attempt to deal with this subject in detail, instances so many accidents that we may feel quite sure that the lives of the "lieges" were, in proportion, subject to as much risk as they are in these days of express trains doing their mile per minute.

But just as railways were opposed upon the ground that they were mischievous innovations, or at all events impracticable—M. Thiers, after a minute inspection of the first lines opened in England, reported to Louis Philippe that railways might perhaps serve to amuse the Parisians on a Sunday—in the same way stage-coaches were denounced by the conservatives of the seventeenth century as "mischievous to the public, prejudicial to trade, and destructive to lands." One pamphleteer asseverated that "those who travel in these coaches contract an idle habit of body, become weary and listless when they have rode a few miles, and are then unable to travel on horseback, to endure frost, snow, or rain, or to lodge in the fields." This *laudator temporis acti* would, therefore, be not less astonished than disgusted could he have seen a good saloon railway-carriage, or even that remarkable travelling-chariot belonging to the late Lord Vernon which Charles Dickens met while upon a tour in Switzerland. These quotations from Captain Malet's work are interesting as a proof that in all ages the human mind is much the same, and that what the one side may praise because it is new, without waiting to see whether the invention has any other merits besides, the other side will denounce upon the very same grounds.

I do not propose, however, to write a *précis* of the work, or even to indicate the chief items of interest. Much useful information is to be obtained from its perusal: useful, that is to say, for those who have taken any part in the movement which has given London at least one new social club—the "Road Club," in Park Place, St. James's—and which has effected a remarkable change in the constitution of the Driving Club. When the Four-in-Hand Club was first started, in 1856, it numbered but fifteen members: now the number has more than trebled itself, while to accommodate those who were anxious to join it, a new club—the "Coaching"—was started in 1870. The latter, of which, as of the older club, the Duke of Beaufort became president, now numbers 120 members, and its third meet of the season, which took place a fortnight ago, was a very brilliant affair. It is a healthy and rational form of amusement for those who are able to afford it, and as long as horses are not altogether superseded by steam, we may expect to see it flourish. But for "coaching" pursued as a trade it is impossible to predict a very brilliant future. The author of *Annals of the Road* gives a full list of those which left London in 1874, and there have not been very many changes since, nor, so long as the tide of fashion continues to flow in this direction, will there

be, for they are horsed by men whose heart is in their work, and to whom £ s. d. are a secondary consideration. They do not, as is well known, make the whole, or even half of their expenses in most cases, for the battle of life is too hotly fought for people to spend two hours upon a journey which can be performed at a quarter the cost in a quarter the time. Coaching, in fact, can never be more than a pastime—but a pastime at once pleasant, innocent, and exciting, which is more than can be said for most of the sports in which we delight.

To those who care for coaching in the present, or like to recall the memories of what England was in the pre-railway days, Captain Malet's book will afford much interesting reading, for if the "good stories" which he tells savour somewhat of the antiquity of the coaches from the roofs of which they were first told, he gives other information which enables us to picture for ourselves the courtyard of many a familiar inn now silent and solitary as the grave. His account of the annual procession of coaches in the City of London on the King's birthday, and of the way in which Mr. Palmer, member for Bath, obtained the reform in the despatch of letters by coach (hence the term mail-coach), is well worth reading. Nor does he neglect the more practical and immediately useful part of his subject, his description of how a coach should be built, horsed, and harnessed being very much to the point. He writes so well that it is a pity he should have borrowed so largely (not, however, without acknowledgment) from other authors; and it is not unfair to add that his narrative lacks sequence, as he goes too precipitately from one branch of the subject to another. Though the volume is a bulky one, Captain Malet might have compressed it into a much smaller space, as, while his own records are compressed into 176 pages, he devotes more than half the book (pp. 177–387) to Nimrod's *Essays*, for which he has written a preface. Now Nimrod's *Essays*, excellent as they are, ought, if they were to be republished, to have appeared as a separate work, and many readers will skip them and glance over the "slang-dictionary" which is appended to the work. Slang is not a good thing in itself, but there are several technical terms which cannot be referred to as a rule in academical English, so it is as well to compile a glossary for the use of the uninitiated. The instructions for mail-guards, and the measurement of roads, are likewise useful as an appendix to the book, which also contains ten coloured plates, lithographed by Hanharht, and referring to various episodes in coaching, from the upset of the Holyhead mail in a snowstorm to a capital reproduction of the Duke of Beaufort's drag, in which, however, the leaders are rather too far from their work. Captain Malet has written his book *con amore*, and his neat motto, "Floreat rheda quadrigalis," is evidently more than mere lip-service.

COULSON PITMAN.

WE have received from Dorpat the first number of what is to be a complete collection of old Estonian popular poetry. The collection is called *Vana Kannal*, i.e. the Old Harp, and the editor is Jacob Hurt.

DRAMATISTS OF THE RESTORATION.

The Dramatic Works of Sir Aston Cokain, With Prefatory Memoir and Notes.

The Dramatic Works of John Crowne. Vols. II., III., IV. (Edinburgh: William Paterson. London: H. Sotheran & Co.)

SIR ASTON COKAIN, "the fine old Derbyshire poet," as he has been styled by the partiality of a kinsman-biographer, here reappears at a disadvantage. His fame is so far from being "current still in England" that few readers have ever heard of him. It is scarcely likely that this reprint will inspire any fresh interest in the forgotten worthy. In their prefatory account of his life, the editors (after extracting the brief notices of Langbaine and Lodge) ramble into genealogical topics with no particular reason except to show how near akin Sir Aston was to Viscount Cullen. They say (on what grounds does not appear) that in this relationship the poet was more than usually delighted. "It arose in this way: William, younger son of Sir John Cockaine and Isabel Shirley, progenitor to the Lord Viscount Cullen," so the explanation starts, not very hopefully, in a sentence without any verb. The verb is not the only link missing. From the facts as stated here, no relationship whatever can be made out. But in the British Museum Library is a privately-printed contribution to local history, entitled *Cockayne Memoranda*. From one of the elaborate tables therein we see what Sir Aston's editors have failed to convey; viz., that from the eldest son of Sir John Cokain and Isabel Shirley descended the Cockaynes of Ashbourne, whose male line ended in the poet, and from the second son of the same marriage descended the Cockayne of Rushton who was father of Charles Viscount Cullen. But the "near relationship" turns out to be that of a far-away cousin.

From the *Memoranda* we also learn that after his "youth bred in Trinity College Cambridge," of which Langbaine speaks, Aston Cokain went to the Inns of Court. Years after, in Master Shallow's vein, he dwells on the merry days he had seen, and hitches the names of his old acquaintance into rugged rhymes:—

"Donne, Suckling, Randolph, Drayton, Massinger,
Habington, Sandys, May, my acquaintance were;
Johnson (*sic*), Chapman, and Holland I have seen,
And with them too should have acquainted been."

Charles Cotton was to him "all of them in one." Lodge says of Cokain that he was "a perfect boon fellow, by which means he wasted all his estate"—but his ruin seems to have been mainly owing to his being a "malignant" and a Romanist. By his composition-deed of June 27, 1649, he appears as a broken-down cavalier, guilty of delinquency "in going into the late King's quarters," a prisoner in the Marshalsea for debt; his "whole estate is not worth above 200*l.*, his just debts being paid." He was compelled to sell Ashbourne and Pooley, and he retired to Derby on an annuity. He died "at the breaking-up of the great frost," February, 1683. His worldly estate was 79*l.*, including "books in a press and trunk, 5*l.*;" "purse and apparel, 10*l.*;" debts, good and bad, 15*l.*"

Cokain was a few days younger than

Milton, whom he survived nine years. He was as little successful in establishing his title to literary as to worldly honours. His baronetcy was dated after the final rupture between Charles and the Parliament. No official record of its creation exists, and it remains a polite fiction, unacknowledged by the heralds. He was "esteemed by many, an ingenious gentleman, a good poet, and a great lover of learning," says Lodge. His present editors speak of his "very clever plays," but would be glad if they could find anybody to agree with them, if we may interpret as an expression of misgiving the singular conclusion of their preface that it will be "some satisfaction to them to learn that their readers' opinion coincides in some measure with their own."

Cokain's dramatic works comprise a masque; a play, the *Obstinate Lady*; a farce in five acts, *Trappolin*; and a tragedy, *Ovid*. The masque, presented at Brethie, in Derbyshire, on Twelfth Night, 1639, is an evident imitation of the Ludlow masque of Michaelmas, 1634. A Satyr and a Lar dispute whether a country or a town life be the better. The Satyr enumerates the joys of those who "walk merry under heaven's bright eye:"—

"Sat. The youthful spring makes us our beds of flowers,
And heaven-bright summer washeth us in springs
As clear as any of your mistress' eyes.
The plenteous autumn doth enrich our banquet
With earth's most curious fruits, and they unbought.
The healthful winter doth not pain our bones.
For we are armed for cold and heat in nature.

Thus we enjoy what all you strive to get
With all the boundless riches of your wit.
Lar. Satyr! when I but say thou'rt ignorant,
Thy flourishing boast is answered at the full.
Sat. But I desire a larger way.

Lar. And take it!
Canst thou compare the rags of nakedness
Before the studied dressings of these times?
And canst thou like a cold and stony cave
Before the perfumed beds of palaces?
Admire the melancholy falls of waters,
Or whistling music of the inconstant winds,
The chirping discords of the wanton birds
Above the angel-voices of our ladies?"

And so on. These are the best lines in the volume. Of the plays which follow, the *Obstinate Lady* is founded on Massinger's *Very Woman*, but with several subordinate and absurd intrigues added thereto. Disguise is the rage among the *dramatis personae*. The hero disguises himself as a negro. A mother disguises herself as page to her son, for no better reason than to see whether her husband, on her supposed death, will keep his promise not to marry again. The hero's disdainful mistress marries his friend, but has a convenient sister in reserve (and in disguise) for him. This young lady was stolen when a child, but as soon as she came to years of indiscretion, put on male attire and followed the hero. *Trappolin*, turning on the substitution by magic art of a vagabond for a Duke of Florence, promises some diversion of the *Devil to Pay* order. But the author's poverty is shown in the damnable iteration of one incident—the release and re-committal of the same prisoners by the false and true Duke alternately. More matter for mirth is afforded by the *Tragedy*

of *Ovid*, wherein Cokain essays the terrible in the main story, with an underplot taken from the same source of which Molière avails himself in his *Festin de Pierre*. Ovid has nothing to do with either. He appears only to exchange insipid dialogue with the other personages, or to deliver a long soliloquy, which reads like a blank-verse article for a Classical Dictionary. In the last scene the "Post from Rome" brings him letters of so unpleasant a character that he exclaims—

"One of these news were much too much to strike
My poor and crazy body into my grave;
But, joining both their poisonous stings together,
I needs must to the world this truth impart,
That Ovid dies here of a broken heart [*Dies*].
Phyl. It was too sad a truth his last breath did
Express, for he, alas, is dead indeed!"

The afflicted bystanders, among them, finish the article for the Dictionary, concluding with this felicitous criticism:—

"His works have an eternity stamped on them—
Do far exceed the Consul Cicero's verses,
And all the lines sacred Augustus ever
Writ in a numerous strain—all the fine poems
The darling of the people, the facetious
And valiant Prince Caesar Germanicus
Hath published with applause—and all such things,
Though wrote by hands that were the spoil of kings."

For the better illustration of this eulogy, and of Cokain's ability to appreciate classic poetry, a few lines may be added from the masque in this play. The masque, I suppose, is to be taken as Ovid's, since it is performed in his presence, at his friend's wedding. Juno, Pallas, and Venus have been summoned to a fresh Judgment of Paris, wherein they yield the prize of beauty to the bride—and no wonder, since the immortals have become elderly. While waiting, they discuss the past infidelities of Jove:—

"Pallas. Pallas hath often blushed to hear Mars tell,
Following his father's steps he did but well;
My brother was to blame.
Juno. Alas, my son
Gloried to imitate what Jove had done—
Your sister Venus was a handsome child.
Pallas. And Mars, when he was young, was very wild."

The concluding volumes of Crowne confirm the impression made by the first (see *ACADEMY*, vol. v. p. 25). An historian might find in *City Politics* some illustrations of the intrigues of Shaftesbury's "brisk boys." A collector of curiosities might (as Disraeli did) notice and censure the poor expedient whereby the "faint defects of age" are ridiculed in the dialect of the toothless Bartoline. But neither would care to reopen the play when his special purpose was served, and no student would find it profitable "for delight, ornament, or ability" to peruse the works of Crowne.

The *Fall of Jerusalem* (1677), *The Ambitious Statesman* (1679), *Thyestes* (1681), *Darius* (1688), *Regulus* (1694), *Caligula* (1698), have the common characteristic of stilted bombast, alternating with the flattest prose. The author expressed his contempt for Racine. It was on his, Crowne's play, that Titus and Berenice would depend for a livelihood with posterity. Racine had treated his theme, *dimisit invitum invitam*, with exquisite skill in his *Bérénice*. His art

keeps us in continual and interested suspense watching a situation which threatens every moment to become ridiculous. Crowne's Titus is a foggy in a "Roman shape," and his mistress a railing coquette. When her representative (the Becky Marshall of Pepys' Diary, the "Presbyterian's daughter" whom Nelly rebuked) returned to speak the indecent epilogue, it could not have struck the audience as out of character. The "wild and unaccountable success" of *Jerusalem* was owing to the scenery mainly, aided perhaps by such touches of nature as the "entry in their night-gowns, as in a fright," of Berenice, Clarona, &c., and the wonderful spectacle of the "whole Sanhedrim sitting asleep" till aroused by the ghost of Herod. The last oddity anticipates and excels the somnolent sentinels of Mr. Puff.

The comedies have a bustle that passed for animation with audiences who were, as the prologues and epilogues tell us, themselves carrying on intrigues, the interest of which made up for any want of probability or coherence in those on the stage. That particular vein of humour which Charles II. technically called "merriment" is constantly present, and rarely indeed does any stroke of wit, more rarely still any touch of feeling, break the cynicism of the dialogue. Crowne makes a set of dirty clay figures, and has no Promethean spark to impart to them the semblance of life. His world of the "mode" and the "gentile" is thoroughly vulgar in manners as in heart. The model fine gentleman bestows a lady who has been secretly his mistress on a ruffian whose villany he has just witnessed, and whom he coerces into the marriage. His greatest successes in character-drawing are Sir Courtly Nice—an exaggerated "humour" of the Ben Jonson order—and Lord Stately. The slow "What? what?" of this last, and his interrogative "ha?" ending his sentences are more than stage-trickery, for his share of the dialogue calls up a mental presentment of his bearing and style of thought—more than can be said for any other of his author's characters.

The editors have vainly tried to vindicate Crowne's political consistency. They compliment him on his boldness in the production of *City Politics*, forgetting that in 1682 the Tory was the winning side. In 1681 Crowne had written these barbarous lines (*Prologue to Thyestes*):—

"... Pagan and Popish priests
Are but two names for the same bloody beasts.
Then halter priests, and tie 'em to the racks,
If you will keep the devil off their backs."

In the same year he had dedicated his *Henry VI.* to Sir Charles Sedley, and commends to that queer theologian a work conceived in the purest Protestant spirit, as Protestantism was understood in the days of the Plot. He afterwards affirmed that this gave offence to those in power, and was suppressed by command. If so, he made amends in *City Politics*. When the play was acted in 1682, it was safe to make fun of Oates and College and the Whigs, and to write:—

"There is in every true Protestant breast
A knave in earnest and a saint in jest."

or,—

"The City Whigs such cursed poets choose,
For that alone they should their charter lose."

But when the play was printed in 1688, the "cause" so ridiculed was triumphant. Oates had a pension. College's daughter was made Court seamstress, in recognition of the injustice of her father's execution. Crowne's fun was awkwardly out of date. He changed his note at once. He had "never personated anyone," and he declared that his shafts were aimed at the men who "abuse the honourable name" of Protestant. The first assertion is manifestly false, and it is certain that no sort of distinction is made in the play between the worthy and unworthy of the party attacked. There is nothing to surprise us in this. From the *Ambitious Statesman* (1679), a violently Tory production inculcating the extremity of passive obedience, to the *Caligula* of 1698, when he felicitated Lord Romney on the success of the Revolution, Crowne was as consistent as the Vicar of Bray. The author of *Regulus*, who could not be a "friend to slavery, treachery, and correspondence with a foreign enemy," had dedicated his *Jerusalem* to the Duchess of Portsmouth, the agent of France in the betrayal of England. He had fixed Her Grace's "image at this Jewish Temple gate, to render the building sacred." He went on, gallantly absurd: "Nor can the Jews be angry with so beautiful a profanation; and in guiding them to you, they are conducted, like their ancestors, to repose and happiness, in the most fair and delightful part of the world."

There is considerable vigour in the prose of Crowne's prefaces, and if he happens to have a preposterous notion to propound, its expression is sure to be forcible. For instance, speaking of the wife in his *Curious Impertinent*, who yields to temptation, but repents—

"I will venture to say the sinner in the Gospel does not make altogether so fair a figure as mine does. The Jewess adulteress is all over stain, her sin is laid open, and her penitence hid, we see nothing of that. The lady in my play sins but once, and often repents."

What sense of humour could a man have, to write thus? That the irreverence was unintentional—mere coxcomby, in fact—we may believe from the concluding sentence of another preface—"Since there is too much Atheism in those plays, I am content they should be thought not mine or not good. I had rather have no wit, no being, than employ any part of it against him that gave it."

The editors are profuse in illustrative matter, in extracts from Geneste, Langbaine, and Lodge, and in a "nice derangement of epitaphs" on the Cokains. But they get confused over a family of eleven sons, and begin a sentence with "Henry thus became heir-apparent" when we have no word of Henry before. They forget their own notice of Crowne's acknowledgment of the kindness of James II., and, in their preface to the very next play, justify Crowne's severe reflections on the "late Court" by the assertion that "James never showed the least inclination to patronise him"—"never showed the least favour to the dramatist. They wander far a-field in search of super-

fluous information, but give no hint in explanation of Crowne's statement that he "had much bread from the princely bounty of King Charles, and claims to more from his justice for a great province of vast value given in his reign to the French, half of which was my father's rightful property and mine as his heir." A similar complaint is made in the preface to *Henry VI.* Both refer to the cession of Nova Scotia to France in 1677. William Crowne's grant of a share in the territory was given him by Cromwell. Haliburton (*History of Nova Scotia*, i. 61) gives a full account of the transaction.

Mistakes in pointing are frequent, and the assignment of the dialogue is sometimes so faulty that a character takes the speech of another or answers his own. The greatest blunder occurs in *Thyestes*, where one scene is interrupted by a fragment of another, and is then resumed and concluded. The other scene follows, minus the fragment inserted in the former. The original edition is not in fault here any more than for the line in *Caligula*, after the death of the tyrant, and the exit of his slayer, Cassius Chaerea,

"For coffins speedily search all the town."

As but one person has been killed, the order seems extravagant. But the old copy has, as a careful reader might conjecture, "For Cassius." Such slips are hardly excusable even by the contagion of dulness breathed out from the pages of Crowne. But perhaps the subscribers to a costly reprint of a worthless author are not likely to look too closely at the more or less of the rubbish they are entitled to receive.

R. C. BROWNE.

ST. BONIFACE.

Bonifacius der Apostel der Deutschen, und die Romanisierung von Mitteleuropa. Von August Werner. (Leipzig: Weigel, 1875.)

It is only natural that historical enquiry should in some measure conform itself to the strong current of feeling which has set in in Europe, and more especially in Germany, against the dominion exercised by the Roman bishop over the half of Christendom for more than a thousand years. Hence the attention which is increasingly paid to the origin and foundation of that authority. The German bishops who have banded themselves together to withstand the Prussian and German ecclesiastical laws hold their meetings year by year at Fulda, by the side of the tomb of St. Boniface, in order that by their prayers at his grave they may draw strength for themselves and their followers to carry on the struggle which they have begun. They are right in regarding their saint as the man who tied the band which is now being loosened, and who, having stifled the first germs of a national Church, did more than anyone else, before or after, ever did to introduce into Germany that compact organisation of the Roman Church which has enabled her to weather the storms of centuries; as the man who devoted his whole life to the idea of the unity of the Christian Church under the leadership of Peter's successor. Boniface's latest biographer takes a substantially different view

of him altogether. Herr Werner, Protestant minister in a small town in Thuringia, considers the subjection of the German Church to Rome, as brought about by Boniface, to have been a national misfortune, which became the source of evil through many centuries. It is by this idea that the author has been guided in his enquiries, and by it he has been prompted in the tests to which he has applied the existing materials.

These materials are insufficient to give us more than a general picture of the life and work of the German apostle. Winfrid (such was Boniface's real name) was born of noble family in the year 680 at Kirton in Devonshire, was educated in the monasteries of Adercancastre (Exeter) and Nhutscell (Netley, in Hampshire), was consecrated priest in his thirtieth year, and went to Friesland in 716 to work as a missionary under St. Willibrord among the heathen Frisians. After being there a short time, he returned to his monastery, and, in 718, journeyed to Rome to present himself to Pope Gregory II. With authority from him to go and preach the gospel "to all peoples entangled in the errors of unbelief," he turned his steps first to Franconia and Thuringia and then back to Friesland, where he laboured under Willibrord from 719-22. Thence he again went to Rome, was made a bishop, and, in 722, took the oath of fidelity to the Pope. Hesse and Thuringia were the first scene of his labours, directed less towards the conversion of the heathen than towards bringing the Christian elements which had long existed there under subjection to himself and to the Pope. His teaching and preaching were directed not against the heathen so much as against the Culdees—Irish and British missionaries, who had there founded a Christian community independent of Rome. The results were most important in every respect. He was made archbishop in 732, and besides the archbishopric of Mainz, of which he was the first head, he founded a large number of bishoprics and monasteries. He held regular synods with the Frankish and German bishops, and accustomed them to pay the same subjection to Rome as he did himself. He fought with spiritual and worldly arms against the clergy who opposed him, and furthered the spread of celibacy and asceticism, the two distinguishing tenets of the Romish Church, in his dioceses—in short, he introduced the organisation of the Roman Church into Germany, and created the tie which has bound Rome and Germany together for centuries. In old age, when he was bowed down by his weight of years, he returned to the scene of his first labours, where, on June 5, 754, on the banks of the Boorne river at Dokkum, he died the death of a martyr among the heathen Frisians.

The facts recalled to the reader's mind are not new; they had already been well-established by Herr Werner's predecessors, who differ only as to their chronological order. According to some, for instance, Boniface was consecrated bishop in 722, others in 725; while three dates—743, 744, 745—are assigned to the Council of Lestines. It cannot be said that these questions are unimportant; our view of the causal connexion between Boniface's acts will

differ materially according to their order of sequence. On such points Herr Werner's book, I think, throws little or no new light; in many cases he does not even attempt to solve the doubt, in others he comes to no positive conclusion. He has, indeed, laid himself open to a still more serious charge. Our knowledge of Boniface's life and work is drawn mainly from his letters, of which a good edition exists by Ph. Jaffé (*Bibliotheca rerum germanicarum*, vol. iii.). An animated controversy was carried on by Jaffé, Dünzelmann and Hahn, in detached pamphlets and articles printed in the *Forschungen zur deutschen Geschichte* (vol. x., xiii., xv.) on the dates of these letters; the least we can require of a modern biographer is that he should know and make use of these careful researches. It is startling to discover that Herr Werner does not even seem to be aware of their existence.

While in some places our author displays a want of that accuracy in research to which we are accustomed, and which we are entitled to demand, in others he goes much too far. He knows far more about the motives which led Boniface to take this or that step, about his ruling ideas, his plans and intentions, than, in my opinion, our scanty sources of information warrant. It is, no doubt, often allowable, and even imperative, to supplement existing records and to fill up gaps with a species of psychological interpretation: but quite as often, I think, it is far better by a *non-liquet*, or the "not proven" of the Scottish jury, frankly to own our want of knowledge than to deceive ourselves and others by bold suppositions, and to concoct something which can neither be called history nor fiction. Lastly, we cannot agree with Herr Werner in the harsh judgment which he pronounces on Boniface and his aims, in spite of the admiration he bestows on his eminent intellectual powers. The latest biographer of the great prelate is neither just to him nor to his efforts, because he measures both the man and the circumstances by a wrong standard: instead of trying to carry himself back in imagination to the eighth century, he judges them from his own standpoint, that of a German with strong national feelings, a Protestant and a scholar of the nineteenth century; consequently his representations are unjust and unhistorical. Of what use can it possibly be to pile up reflections on the turn which things would have taken, long ago, if this or that event had or had not happened? We shall seldom get beyond unsafe hypotheses, and only in the rarest instances attain positive certainty. One thing, on the contrary, is certain: it is not the province of history either to accuse or to excuse, but to try to understand what has happened and how it happened—perhaps, too, why it could not happen otherwise.

HARRY BRESSLAU.

Language. By Andrew Findlater, L.L.D. (London and Edinburgh: W. & R. Chambers, 1875.)

THIS little book, which forms one of Messrs. Chambers' "Elementary Science Manuals," shows that they are still determined to retain the pre-eminence which many years of continued attention to the cause of popular

education in this country have won them. They are not more to be praised for their perseverance than to be congratulated on the happy choice they are wont to make of persons to execute the work they have at heart. The present instance is no exception: Dr. Findlater seems to be quite in his element when writing an outline of the Science of Language for the higher classes in our elementary schools; but more advanced students will also find it a very valuable handbook. In fact, we are told in the preface that it is meant not only as a school text-book, but also for self-instruction and private study. The plan on which the author went to work seems to us to be a very good one: it is this. The subject is made, as far as possible, to unfold itself gradually, as if the pupil were discovering the principles for himself, the chief function of the book being to bring the materials before him, and to guide him by the shortest road to the discovery. This is a step in the right direction, and every one who knows anything of elementary education in these days must agree with Mr. Matthew Arnold that what we most want is the knack of making our boys and girls learn to think.

The book is sold for tenpence, but we may safely say that the following paragraph alone is worth a great deal more:—

"Language passes from generation to generation by tradition; the rising generation naturally learn to speak as the adult generation speak; and where there is any express teaching on the part of the old, it is to the effect of guarding the young against any deviation from existing use. But, notwithstanding this, language does change, has always changed, and will continue to change, like everything human. In proof of this, we have only to look back at English as it appears in any book written two or three hundred years ago. It already begins to have a strange aspect, and were it not that almost everybody still reads the Bible and Shakspeare, its strangeness would strike us still more. Chaucer, who wrote two centuries earlier than Shakspeare, can be understood by ordinary English readers only with pains and the help of a glossary. When we go back five centuries farther to King Alfred, the language of the royal author is as much foreign to us as Dutch. So much is this the case that it has got a different name, and is spoken of as Anglo-Saxon. It is really, however, the same uninterrupted stream of English, only traced farther up towards its source."

A few school-books written in this tone would put to flight the absurd notions which Mr. Freeman and others have been for years combating with so much vigour and zeal. The difficulty mainly consists in the natural conservatism of schoolmasters, who are satisfied with their old notions and the old books that embody them. So all who wish to see education not reduced to a mere art of perpetuating exploded ideas should keep a strict watch over the text-books used. In point of detail, there are a few questions on which we should be disposed to differ from Dr. Findlater: for instance, one cannot approve of his adopting Dr. Farrar's genealogical tree of the Aryan tongues, especially as regards Wallachian. In his table of Grimm's Law he appears to have followed Professor Whitney too closely: for instance, under Celtic, which is no language in particular, we have a Welsh word *dan*, while most of the rest is Irish. As he can afford five columns to the Teutonic languages, he might

have given two to the Celtic ones, seeing that these islands still contain people known as Irish, Scotch Gaels, and Welsh. As it is, the Arabic and Turkish instances serve no particular purpose; why not Arabic and Hebrew, or Turkish and Magyar, or Finnish? With these trifling reservations the book may be recommended as a great boon to our schools.

J. RHYS.

CURRENT LITERATURE.

Die Ethik des Spinoza im Urtexte, herausgegeben, und mit einer Einleitung über dessen Leben, Schriften und Lehre versehen, von Hugo Ginsberg. (Leipzig: Koschny.) There has been so much literature about Spinoza in the last thirty-two years, since Bruder's edition of his works was stereotyped, that we should be glad of a new edition even if Bruder's had been absolutely faultless for its date. This, of course, it is not: the way in which the old preface to the posthumous works is cut up is rather vexatious, and though Bruder's references to the passages of other authors which Spinoza had in his mind are useful and unobtrusive, it might have been better if he could have marked in some way that they formed no part of the original text. Then, no doubt, there are misprints, though they are not of a kind to embarrass even a careful reader, and there may be places where he has ventured on some mild and imperceptible corrections of Spinoza's Latin. But we are afraid that if a new edition of Spinoza is desirable Dr. Ginsberg's attempt will only delay its execution; and this is the more to be regretted because the introduction—the only part of the work which depended entirely on himself—is really well and pleasantly done. It would be a good thing for everybody to read Spinoza in an edition that told them that he was not expelled the Synagogue for learning Latin and that he can hardly have been in love with his master's daughter, a child of eleven, and to be familiarised with the curious parallels between his system and that of Chasdai Creskas, a Jewish Rabbi of the fourteenth century, whose object was to defend Talmudic orthodoxy—by very questionable weapons—against the Arabian version of Aristotelianism. Dr. Ginsberg follows Dr. Joel, if anything, too confidently: after all, there is much to be said for the old view that Spinoza was consciously more influenced by the Cabbala than by anything else; he speaks himself of the doctrines of Hebrew theology, though disfigured by traditional excrescences, as identical with his own views, and this suits the Cabbala better than Creskas. On the other hand, Dr. Ginsberg carries incredulity to an amiable excess in dealing with Stolle's imputations on Spinoza's personal character. Stolle was in Holland twenty-eight years after Spinoza's death, and got acquainted with an old man who professed to have known him well, and obviously did know a good deal about him—as much probably as anyone of Coler's informants, and the belief in Spinoza's sanctity rests mainly on Coler's account of him and the fine tone of his own writings. Now, according to Dr. Ginsberg's own reckoning, both Spinoza's great books were pretty well finished ten years before his death, and he seems inclined to believe, on the word of Stolle's old man, that Spinoza said that it must not be supposed the Evangelists and Apostles were such holy people as they appear in books and are generally thought. Rieuwertz, an ardent admirer, writes that he said his *Ethik* had cost him so much trouble that unless it were done already he would never begin it again. These things being so, it is far from unlikely that Spinoza, like other people, should have maintained a higher tone of feeling and conduct in the midst of toil and poverty than when he was at ease and well-to-do. Stolle's charges really do not come to more than this: Spinoza sometimes ate and drank too much and now and then gave way to other sensuality;

his guarded way of speaking of his opinions had after all a shabby side to it. Most who had known him very properly preferred to remember his uniform gentleness and considerateness; the heroic abstinence he had practised while it was necessary; his spiritual wisdom, and the prudence with which he guarded his dignity and independence; the simplicity of tastes which he kept to the last; the habitual temperance which is really not incompatible with Stolle's report, for he lived a good deal with people who thought much less of a couple of cans of wine than the censorious old man who was Stolle's informant. The other charges against Spinoza's life may be dismissed more briefly: he was falsely accused of an intrigue with Condé; he was rather tenacious of his share of the family property, doubtless to assert the principle that excommunication ought not to involve disinheritance; he also composed a long and bitter book against the Jews, but having relieved his feelings by the composition, he was too wise and generous to publish it. One of the best things in the introduction is the account of how Spinoza's influence died out in Holland gradually and ingloriously. It is rather a strong tax on our credulity to be asked to think that all the German works in which Spinoza is directly or indirectly treated of are more important than those of Saisset or Caro. When we take leave of the introduction and come to the text our pleasure is over; the page and the type selected are both less convenient than Bruder's, the substitution of widely-spaced type for italics is anything but an improvement. The printing of the preface to the posthumous works is positively distressing by dint of sheer untidiness; and there is a long and not a complete list of Errata; e.g., on page 60 we read, after making one correction, "Eodem modo ac omnes concipiunt et ipsius Dei natura sequi ut se ipsum intelligat;" if *et* is not a misprint for *ex*, which Bruder prints, the least Dr. Ginsberg could fairly do was to explain and establish in his preface the particular kind of solecism he attributed to his author. We say nothing of "infirmittatis" for "infirmittates" on page 74: it may only be a digression into a different system of spelling, but it is rather odd when we read "cognoscismur" for "cognoscimur" on page 81, and are told to mend matters by reading "cognoscimur" instead of "cognoscismur;" and on page 74 we are told in the Errata that "pugnare" is printed for "pugnare," whereas what is really printed is "pugnare." Though the Errata stop with the preface, the misprints do not. On p. 105 we have "poerandum" for "operandum;" on p. 113, "imiginantur" for "imaginantur," "odoriferia" for "odorifera," unless this is one of the places where Bruder tries to be too classical. A whole line, ending in the middle of a word, is left out between pp. 112 and 113. After these specimens from the first part of the *Ethica*, a reviewer may be excused from going through the whole book, which does not improve as it goes on. P. 192, we have "eatnus" for "eatenus;" p. 215, Dr. Ginsberg follows Bruder, and no doubt the *editio princeps*, in reading "castitati" where the sense and context imperatively require "libidini," which got displaced by a clerical error of a kind which everybody who writes commits sometimes, because the termination of "ebrietati," which comes just before, suggested another word with the same termination and some relation, though as it happened a wrong relation, to the next stage of the writer's thought.

The Lives of the Saints; August and September. By the Rev. S. Baring-Gould. (Hodge.) As Mr. Baring-Gould proceeds in the execution of his undertaking one conviction seems to grow upon him more and more, that there is a good deal in common between hagiology and pathology, and he has not yet arrived at the stage in which he will occupy himself with the characteristic differences of two branches of knowledge which have hitherto been regarded as entirely separate. At present he is content to point out that it is no

wonder that Saint Rose of Lima had strange and sometimes unwelcome visions if we consider how she had ruined her health by austerities, and that St. Catherine of Genoa was obviously of an hysterical temperament, which her husband might well find trying, though both, under the guidance of the Church, made the best of their peculiar organisations. Oddly enough St. Hildegard, whose visions might easily have been represented as waking nightmares, is treated more respectfully, because Mr. Baring-Gould sympathises with her opinions on ecclesiastical and secular politics. In treating of the life of St. Joseph Cupertino (the especial abomination of M. Emile de Laveleye) Mr. Baring-Gould is careful to lay quite as much stress on the facts that he passed for more than half an idiot in early life, and had to the last a curious way of yelling and taking wonderful bounds through the air, as on his power of influencing waverers and reading thoughts. There are pleasanter things than these in the volumes: the pleasantest, perhaps, is the life of St. Elzéar, the husband of St. Delpine, who survived him for many years. They were Provençal nobles of the thirteenth century, married by their relations while children to unite the estates. They had a model household, lived together like brother and sister, and when Elzéar had to go to Naples he wrote to his wife that she would still be able to meet him in the Sacred Heart. The life of St. Liberius is told fairly and without any undue desire to make partisan capital out of it. There is an ingenious defence of the legend of the Theban legion. It is assumed that the local legend of a massacre of Christian soldiers at Agaunum is trustworthy; and then it is argued that the Theban legion would naturally have been cantoned all along the Rhine; that its head-quarters may have been at Agaunum; that there the massacre may have been general, while the Christian soldiers and officers were picked out and executed at other stations; and, lastly, that we have no particular reason to expect that, if this series of events really occurred, we should have found it clearly described in one or other of the primary authorities for the period.

Sermons out of Church. By the Author of "John Halifax." *Liber Humanitatis.* By Dora Greenwell. (Dalby, Isbister and Co.) The first of these books is mainly practical, the second mainly theoretical. Mrs. Craik's tendency is Protestant and beneficent: Miss Greenwell's is Catholic and ascetic; but both have their most characteristic feature in common. Both show that something like a transaction, not to say a capitulation, between religious and common-sense morality is impending; that a great many intelligent and well-disposed people will soon begin to settle *a posteriori* many most important questions which they have been used to settle *a priori*. People have been used to take their good generous impulses for granted, and judge of life by them, or else to take the tradition of their betters for granted, and judge of life by that; and now it seems they will have to look at life for themselves as the primary foundation on which to build their judgment. Neither writer has quite faced the question whether life bears being looked at in this way. For instance, if everybody moved to give up her or his own wishes or interest to another were solemnly to consider whether the other would really be benefited, or only gratified and rather meanly gratified, no doubt a good many very dull and very painful domestic tragedies would be withdrawn from the stage of the world, but it would be at the expense of making family life harder and more heartless, and more like social life; for a great deal of the superiority of family life depends upon a willingness to fulfil one another's wishes without judging them. But here, as in everything else, the author of *Sermons out of Church* accepts with little or no reserve the principle that conduct is to be guided by such of its consequences as can be foreseen, and fails, like most apostles of that principle, to realise that the only way in which people can be got to control them-

selves is by keeping up artificially an impulse which is sometimes naturally strong. For instance, the author has a very clear vision of the good that might be done if we looked after our dependants systematically, and in one way she is quite right; but most dependants resent interference, most superiors shrink from it, and so most of us leave our dependants without guidance, abstaining from an enterprise which is too difficult to be desirable. The writer is more reasonable when she insists that "our often infirmities" are largely due to the joyous imprudence of youth, and to the way in which people of all ages over-eat and over-drink themselves, for it is much easier to abstain from what we judge undesirable than to do what we judge desirable—though, after all, the prospect of old age under the most favourable circumstances, which is held out as the reward of self-control, hardly seems very attractive. One closes the book with the impression that life has been stripped to the bone, and that then the skeleton, dressed up in Sunday clothes, comes forward to lecture us on our duties, and tell us, among other things, that women ought not to have children unless they are prepared to give up all other interests. Miss Greenwell's book is perhaps less depressing because it does not profess to be cheerful; it is her chief distinction that she was the first Protestant writer who discovered, at least in recent times, that nature as well as vice is opposed to Christianity, whence it is perhaps natural that she should have discovered that Roman Catholicism is simply the oldest and strongest, and on the whole, the purest form of Christianity in the world, and that the so-called errors of Rome are either needless exaggerations of Christian principle, or else the rusty armour of the past which wounds the body it defended once. It is not surprising that the letters which develop this thesis were refused admittance by all English and American papers to which Miss Greenwell offered them. Even this paper, though mainly controversial, does not close without coming round to the fundamental thought of the book that asceticism is indispensable, and very nearly impossible, which is illustrated from Schiller, who is evidently a favourite author of Miss Greenwell's, as she quotes him more correctly than most of her other authorities. The most original essay is an enquiry into the connexion between poetry and religion. The author comes to the conclusion that both are competing forms of idealism, that devotion to one is generally attained at the expense of devotion to the other, and that devotion to either is better than devotion to the world. There is an attack on utilitarianism, stating fairly enough the familiar point that if people regulate their action by a consideration of what is worth while they will come to the conclusion that nothing is worth while. Further, the author has found out that in common affairs people cannot be got to act in the long run on any but common-place motives, that conduct is very much a matter of constitution, and that in all but the widest and strongest and healthiest natures, one set of virtues or one set of talents develops itself, if it reaches any high development, at the expense of the rest of the character. Under all these difficulties, she still maintains "the comparative freedom of the Will," and the importance of subordinating the natural to the supernatural life; but, upon the whole, the chapters which develop these views, and that on "The Dignity of the Human Body" (on which she often coincides with Mrs. Craik), rather remind us of the truth that an old garment wears out faster for being patched with new cloth.

The Everlasting Sign. By the Rev. William Hudson. (Longmans.) Mr. Hudson, whose *Life of John Holland* we noticed some time ago in the ACADEMY, has been struck, it seems, by the fact that the old evidences of Christianity are rather less effective than they used to be, and so he has looked out for an evidence which shall always be equally effective. He has found one that satisfies him in "The Christian Life," especially the

Christian life of those who have been gross sinners before their conversion; but it has not occurred to him that the very fact that some lead much worse lives than others before their conversion, which gives their conversion the supernatural appearance on which he relies, is an evidence against his postulate that everybody has the same religious faculty and the same responsibility for cultivating it.

NOTES AND NEWS.

THE Rev. Charles J. Robinson has been commissioned by the Merchant Taylors' Company to prepare for publication the "Probation Lists" of their ancient and eminent school. It is believed that a perfect list of the scholars from the year 1607 to the present time may be framed, and that in most instances the dates of birth, and in many the particulars of parentage can be obtained from the school records. It is proposed that to each name should be appended such biographical information as can be collected from authentic sources. "Old Merchant Taylors" may do good service by communicating with the editor, whose address is Norton Canon Vicarage, Weobley, Herefordshire.

We understand that Professor Max Müller has selected M. Darmesteter, of Paris, a highly promising young scholar, to undertake the translations from the Zend Scriptures in the series of the Sacred Books of the World.

Among the four candidates for the vacant professorship of Anglo-Saxon at Oxford whose names have hitherto been announced there are two highly competent scholars. These are the Rev. J. Earle, who formerly held the professorship himself, and Mr. H. Sweet, President of the Philological Society. Both of these scholars have done good work in Anglo-Saxon. Mr. Earle's edition of the *Chronicle* is acknowledged to be one of the best edited Anglo-Saxon texts that has ever been produced in England, showing not only accurate scholarship, but also wide historical and antiquarian knowledge. Mr. Earle has likewise published some shorter Anglo-Saxon pieces. He has also treated incidentally of Anglo-Saxon in his *Philology of the English Tongue*, a work which, in spite of its numerous merits, was unfavourably received in the philological world, as evincing an imperfect grasp of the fundamental principles of scientific philology. Mr. Sweet's chief work is his edition of Alfred's version of Gregory's *Cura Pastoralis*. In his grammatical introduction Mr. Sweet showed the erroneousness of the existing views of the chronology of the language, and was able by a careful study of the oldest MSS. to give a clear account of the characteristics of Alfredian English, and its relation to the later stages of the language. Mr. Sweet's other contributions to Anglo-Saxon are his sketch of Anglo-Saxon poetry in the new edition of Warton, and numerous papers read before the Philological Society of London. Mr. Sweet is now engaged on an Anglo-Saxon Reader, with notes, glossary, and full grammar, which is nearly finished.

THE second issue of Original Series Texts in the Early English Text Society has just been made. It consists of two thin volumes, the first edited by Mr. J. R. Lumby—a few short Anglo-Saxon poems on the Day of Doom, the Lord's Prayer, &c.—from the unique MS. in Corpus Christi College, Cambridge; the second, edited by Mr. Furnivall, from Lord Ellesmere's unique MS., "Francis Thynne's *Emblemes and Epigrams*, A.D. 1600." No text for the Extra Series is yet ready. The first will be Part II. of Prof. Zupitza's fifteenth-century *Guy of Warwick*, completing the book.

DR. JULIUS ZUPITZA, now Professor of English at the University of Vienna—editor of the second or fifteenth-century version of the *Romance of Guy of Warwick* for the Early English Text

Society, &c.—has been appointed Professor of English at the University of Berlin.

M. D. BIKELAS's translations of *Romeo and Juliet*, *Othello*, and *King Lear* into Modern Greek will be ready in a few weeks.

MR. WALL, the latest translator of Molière, being determined to preserve the flavour of the original passages in *patois*, has secured the help of a well-known English-dialect writer to reproduce the French *patois* in "Zummerset."

THE members of the Hunterian Club of Glasgow are to get another present from another of their liberal fellow-members. The *Scottish Worthies* of a minor poet, Alexander Garden, or Gardyne, of Aberdeen, was supposed to have perished, but Mr. David Laing, of Edinburgh, having discovered in the Auchinleck Library a manuscript copy of this hitherto lost book, suggested its publication by the Hunterian Club, together with the same author's *Lyfe, Doeings, and Death of R. R. William Elphinstone, the 23 Bishop of Aberdeen, translated (into Scottish verse) out of the Lives of the Bishops of Aberdeen, be Maister Hector Boes*, from the original unprinted manuscript in Mr. Laing's possession. The two works, it is anticipated, will form a volume of about 300 pages, and the council of the club has just announced that Mr. Alexander B. Stewart has generously undertaken to defray the cost of its production as his gift to the members. The volume will be printed under Mr. Laing's editorial care, and will contain an introduction by him, giving some account of Alexander Garden and his writings.

M. RICHEPIN's *Chanson des Gueux*, mention of which was made in our Paris letter of last week, has been seized by the police.

THE Academy of Inscriptions has chosen M. Gorresio, the translator of the *Rāmāyana*, a foreign associate, in place of the late M. Lassen.

WE are glad to notice that a new edition has appeared of the Rev. George Matheson's *Aids to the Study of German Theology* (T. & T. Clark). It is an excellent and modest little book, and may be heartily recommended to beginners. It seeks to present the fundamental conceptions of German theology, not merely rendered into English language, but transmuted into English thought. As such, it earns the gratitude not only of students, who find light where darkness usually broods thickest, but of all who have a regard for the purity of the English language. Though necessarily slight, and here and there hasty, it succeeds to a marvellous degree in presenting an intelligible sketch of the chief doctrines of German theology, couched in language whose style and thought are really English, not the bastard jargon of most so-called translators of Kant and Hegel.

MESSRS. PUTTICK AND SIMPSON sold, on Thursday the 29th ult., a copy of Earl Russell's *Memoirs of Thomas Moore*, bound in twelve vols., interleaved and illustrated with portraits, plates, and about 700 autograph letters of contemporary authors, artists, poets, statesmen, and other celebrities, with whom Moore was intimate; the price fetched was 26*l.* On the same day was sold for 20*l.* a letter of Burns to Mrs. Riddell, with an original stanza commencing "The trout in yonder wimpling burn;" a second letter to the same fetched 6*l.*, and one of Mrs. Burns, "Bonnie Jean," written after the poet's death, 2*l.* 15*s.* An interesting series of letters of John and Charles Wesley, Selina Countess of Huntingdon, George Whitfield, and other leading persons connected with the establishment of Methodism, chiefly addressed to Blackwell, the Lombard Street banker, caused much competition. The highest price fetched by a single letter of John Wesley, there being upwards of thirty offered in separate lots, was 5*l.*; the price of the majority ranged from 40*s.* to 50*s.* A letter of Charles Wesley, containing the hymn, "Come, thou everlasting Lord," sold for 7*l.*; others of George Whitfield,

for 40*s.* and 56*s.*; twenty letters of Lady Huntingdon, about her chapel in Bath, 12*l.* 15*s.*; and five letters of Dr. Doddridge, for 55*s.* Among the miscellaneous lots was a letter of Cromwell to Sir John Wollaston, dated August, 1649, the signature only being in his handwriting, which sold for 5*l.* 10*s.*

IN the *Fortnightly Review* Dr. Bridges argues very ingeniously that Harvey's discovery depended much more upon a careful comparison of structure and inferences as to function than upon the incidental confirmation which his doctrine derived from vivisection, which last was of less importance than Malpighi's discovery of the capillary vessels through which the blood actually passes from the arteries into the veins. Mr. Bagehot's article on "Adam Smith as a Person" points out skilfully how he was trained for his work on the *Wealth of Nations* by his position at Glasgow and by his visit to the Continent as tutor to the Duke of Buccleuch—a position which he owed to Charles Townsend's admiration for his *Theory of the Moral Sentiment*, upon which, perhaps, Mr. Bagehot is somewhat too severe. H. H. Statham, in the course of "Reflections at the Royal Academy," observes that the painters of fashionable ladies now seem much less fortunate in their sitters than Reynolds, Gainsborough, and Romney: the observation deserves to be tested, and, if it holds good, to be followed up. "Past and Present," by Frederic Harrison, is concerned with the defence of a temperate belief in evolution against some rather hysterical regrets which Mr. Ruskin, it seems, has expressed in a letter to the writer in the June number of *Fors Clavigera*. Mr. Harrison makes some true points: as that art never does much for the community which produces it (which probably Mr. Ruskin would not deny), as it rather resembles the blossom which is apt to exhaust the plant which brings it forth; that one art is often in a state of progress when others are in a state of decay: he insists with reason on the privileges which this generation has (or has had) in the way of music: otherwise he does not deal with Mr. Ruskin's fundamental contention that hitherto there is little reason to believe that the best products of complex or late civilisations are equal in ideal perfection to the best products of rudimentary or early civilisations, or with his inference that it would be a gain to dissolve the existing complex organisation by concentrating all individual energy upon developing the rudimentary elements of life, except, indeed, by an ineffectual appeal to mankind to admire Miss Nightingale more than Joan of Arc. The first part of Edmund Gurney's essay on some disputed points in music is taken up with a criticism of the inadequacy of Mr. Spencer's hypothesis of the origin of music as a simple methodisation of emotional speech, while he does not object to Mr. Darwin's theory that music is originally the language of sexual exaltation, sometimes idealised for itself, sometimes extended in the service of other emotions. In general the writer is disposed to dwell on all that is incommunicable and unique in music. He is also aware of the enjoyment which many whose strictly musical perceptions are dull or null honestly derive from plenty of noise of fine quality, to which he is inclined to trace much of the popularity of Beethoven, and more, if not most, of the popularity of Wagner.

IN the *Cornhill* there is an article on Horace's Art of Conduct, even better than that on his Art of Poetry in July, 1875, which would be nearly perfect within its limits if the writer had taken his translations of the Satires and Epistles from Professor Conington. The writer's limits seem to exclude all consideration of the chronology of Horace's writings, and of most of his special relations to the world around him; though he discreetly remarks on "the timidity with which he used his chances," and that great part of our interest in him arises from

our sympathy with his confessions of failure to practise his own art thus summarised:—

"First, check all enjoyment something short of the full, and mollify ill-fortune by a constant recollection of change soon to come; second, do not much postpone joys, nor depreciate small ones; third, the superior, permanent, critical self so obtained, keep conciliated, in spite of some failures, by a method of renewed effort which is not quite penitence."

The "Delightful Woman" is Mme. de Sabran, described from her recently published correspondence with the Chevalier de Boufflers.

IN *Macmillan* there is an entertaining paper on "The Faust Legend," by H. Sutherland Edwards. We should have liked more information about Faust the professor at Oracow (who may or may not have been a descendant of the printer), whom Melanchthon judged so severely, and of Twardowski, the Polish Faust. Mr. Arnold's "Last Word on the Burials Bill" is that in public places everything must be regulated by public order, and that, therefore, if there is to be any service at all, the existing service should be performed, as now, by the clergy, who should perform it over everybody whose friends wish it; the rubric about the unbaptised and the excommunicated being left out, as also the expression of any hope for the individual departed, while the service itself might be improved by substituting the short lessons of the Roman rite for the consecutive reading of 1 Corinthians xv.: as a concession to human infirmity a hymn might be permitted.

Fraser contains a very interesting article on Austria and Turkey which throws some light on the real wishes and interests of the various races who in different degrees are parties to the quarrel. It contains also an interesting paper by Mr. W. B. Scott on a Scottish Kirk Sessions-book for 1691, showing how the laird who guided the firing-party to Semple's house afterwards had to do prolonged penance for adultery. F. W. Newman has a criticism on Mr. Isaac Taylor's Etruscan theories which would have attracted more attention when the subject was fresh.

THE "Conversation in a Studio" in *Blackwood* treats the question of "Spiritualism" with as much candour and acuteness as can be expected in dealing with a subject where it is desirable before all things to avoid credulous curiosity. "John's Hero" is a *passé littéraire*, out of the loose papers of whose youth "John" constructs an immortal novel.

IN the *Leisure Hour* Principal Dawson begins a series of papers on the myths of the New World, which, though uncritical, will be worth following.

IN *Belgravia* Mr. Swinburne's "Song in Season" is addressed to a heartless beauty, which rhymes to duty in the first and last stanzas. The instalment of the "New Republic" contains an interesting *pastiche* of Matthew Arnold's unrhymed anapaests.

THE first number of the *Christian Apologist* has a paper by the Rev. George Henslow, on "The Nature of Scientific Proofs," which is worth reading. He goes through the best accredited principles of most sciences, and points out that there is a sense in which the proof on which they rest is a good deal short of mathematical demonstration or ocular observation; whereupon he holds that they rest on "moral conviction"—which shows the very confused state of thought upon the subject.

IN *Temple Bar* there is an article on Thomas Dodd, the print-collector, by a person who has used his unpublished catalogues and autobiography, whom for some reason he thinks it well to call "the last of the grand school of connoisseurs."

THE *Revue des Deux Mondes* for June 15 contains an interesting article on Sebastian Cabot, who had his full share of illusions drawn from old cosmographers; an article on M. Louis Keybard's enquiry into the question what manufacturers in different countries have done, or can do, to pro-

vide for the wellbeing of their *employés*: apparently the only permanent thing is to give them good houses and a chance of buying them; other schemes answer for a time, but fail, owing to the irritation caused by disputes about wages. There is also an article on Tarass Grigorievitch, who did for Little Russia what Burns did for Scotland, gathering up most of the poetical motives popular in a region where, for reasons explained in the article, the poetical spirit was more active than in the rest of the Empire.

IN the *Contemporary Review* Mr. Spedding begins an examination of Lord Macaulay's essay on Bacon, taking for his special text the two paragraphs in which Lord Macaulay sums up his view of Bacon's personal career. In the present number he works through the first as far as Bacon's action in the Parliament of 1593, one of the points in which his vindication of Bacon seems most completely successful. Arthur Arnold's article on Turkey contains a vigorous polemic against Mr. Bosworth Smith, and is coloured throughout by an assumption that all the good parts of the Koran must necessarily be a dead letter and all the worst parts remain in full vigour in every Mahometan state with Christian subjects; the writer appears to have had opportunities of interviewing Fuad Pasha. M. E. Grant Duff's paper on the "Pulse of Europe" is a careful *résumé* of our scanty information on a subject on which it is easy to declaim. R. H. Hutton, in dealing with "Christian Evidences, Popular and Critical," begins by showing that the question of the Resurrection is really much simpler than that of the identity of the Tichborne Claimant, of which the people are obviously unfit to judge; and concludes that, as the twelve certainly conceived it their function to bear witness to it, and were changed by their belief in it, we must rest satisfied with the evidence, if it is matter for evidence at all. H. G. Hewlett's "Songs for Singers" contains a very clear explanation of the paradox why so little of the writing of such musical poets as Shelley, Coleridge, Keats, and Swinburne is fit for music, while Mr. Browning's songs are fit to be sung. Mr. Fairbairn's concluding paper on Strauss is not the least interesting of the series, and Mr. Jukes' reply to Mr. Oxenham is admirable in tone, and not least effective with reference to the patristic side of the controversy.

IN the *British Quarterly Review* E. A. F. has a very valuable paper on the Illyrian Emperors and their land. We may notice especially the passages on the Diocletian persecution, the fate of Diocletian's wife and daughter, and the short-lived Pagan and Dalmatian empire of Marcellian and Nepos. We should have been still more grateful if E. A. F. had told us how far Illyricum became, and how long it remained, a Latin land. The author of the article on the career of Mr. Disraeli observes, apparently by way of censure, "He is almost the only eminent man now living who breathes the spirit of the age of Goethe and Byron."

MR. GLADSTONE'S article on "The Courses of Religious Thought" has called forth an animated reply from (we presume) the editor of the *Allgemeine Zeitung des Judenthums*, the well-known Rabbi Dr. Philippson, of Bonn. The ex-Premier is charged with fundamental errors on the subject of Judaism. Thus, by classing the Jews with the "Theists," he implies that they have no "objective foundation" for their faith, forgetting that the Jews have "the oldest and most uninterrupted of religious traditions." More important is Dr. Philippson's criticism of Mr. Gladstone's conception of the Messiah, which may be thus resumed: the Jews, like the Old Testament prophets, look up to this personage as the deliverer of Israel and of humanity; Mr. Gladstone, like Christians in general, interpolates the idea of a personal relation between the Messiah and the individual believer. He is, we are told, equally mistaken as to the views of the "reformed Jews"

on the blessings of civilisation, which he supposes that they practically identify with the Messiah. The truth rather is that, without renouncing the hope of the personal Messiah, they superadd to it a belief in a Messianic age—i.e. an age when the conditions of life, both spiritual and material, shall be ideally transformed. But did not the prophets themselves speak sometimes of the Messiah, sometimes more generally of the blessings of the Messianic age?

IN the June number of the *Nuova Antologia* there is a careful article by Signor B. Malfatti on Bernardo, King of Italy, the grandson of Charles the Great. Signor Malfatti has brought together all the scanty facts that are known about him, and has striven to make clear the part played by him in the history of the time. In the same magazine is an account of the restoration of the little church of St. Cecilia at Bologna, which stands behind the church of San Giacomo Maggiore. It was built by the order of Giovanni II., and was adorned in the years 1505 and 1506 with a series of frescoes representing the life of St. Cecilia by Francia, Lorenzo Costa, and three of their pupils. The church was suppressed in 1805, and used as a sort of lodging-house by the fathers of the neighbouring convent. The walls were terribly damaged, and only in 1874 was it determined by Minghetti to restore the church and the frescoes. The work was intrusted to Signor L. Cavenaghi, who seems to have executed it with great care, and to have restored the frescoes with as little repainting as possible.

OBITUARY.

AVENEL, Georges, at Paris, July 1, aged 48. [Author of a Study on Amcharis Cloatz, *Lundis Révolutionnaires*, &c.; editor of *Voltaire*.]

FERRARI, Joseph, at Rome, July 1, aged 65. [Editor of *Vico*; author of *Idee sur la politique de Platon et d'Aristote*, *Essai sur le principe et les limites de la philosophie d'histoire*, *Histoire des révolutions d'Italie, ou Guelfes et Gibelins*, and numerous other works.]

LEIGHT, Col. Egerton, M.P., in London, July 1, aged 61. [Author of *Ballads and Legends of Cheshire*.]

HARRIET MARTINEAU.

ON July 1 the grave closed over the remains of one of the bravest and hardest-working women whom our time has known; and no time has been more fruitful than ours in women of mark. Harriet Martineau was buried in the old cemetery, Birmingham, on Saturday. We should have expected Norwich—the city in which she was born, and which had been the home of her family for the 200 years since the revocation of the Edict of Nantes brought them to England—to have been selected for this honour, if she had made up her mind to leave her beautiful little home in the Lakes, in full view of Rydal Mount. As she seems, however, to have made every last arrangement herself, the selection of her resting-place was probably her own; but it is Ambleside and not Birmingham which will always be connected with her name. It is true, no doubt, of the greatest of us that

"Day by day our memory fades
From out the circle of the hills,"

but we venture to predict that the fading in her case will be slow in the Westmoreland hamlet, which was her chosen home for more than a generation. The figure of the invalid deaf lady—so loving in her family life; so simple and neighbourly, in the truest and deepest sense of the word, with rich and poor; so old in years but young in heart; so courageously tilling and cropping her two acres of ground; so full of the brightest and freshest interest in all political and social questions; so ready to make experiments in all realms visible and invisible, and to state results as she saw them, with a candour and fearlessness as valuable as they are rare—is one which will not be lightly forgotten, even in the land of Wordsworth, Coleridge, Southey, and Arnold.

Hard work and high courage were, to our thinking, her most noteworthy characteristics. Even those most familiar with her life and work will have been startled at the list of her writings drawn up by herself, "to the best of her recollection," which appeared in the *Daily News* as an appendix to the autobiographical sketch left by her for publication with the editor of that journal, to which alone in her later years she had contributed no less than 1,642 articles. From this list it appears that her first book, *My Servant Rachel*, was published in 1827, her last, *Biographical Sketches*, in 1869. In those fifty-two years more than 100 volumes (103 we believe to be the exact number) appeared from her pen, besides which she was a constant contributor to quarterlies, and monthly magazines, and newspapers, and carried on a correspondence which would of itself have been enough to use up the energy of most women. Apart from all question of its contents, the mere feat of getting such a mass of matter fairly printed and published could not easily be matched, and the more the matter is examined the more our wonder will grow. In all that long list there is not a volume, so far as we are aware, which bears marks of having been put together carelessly, or for mere book-making purposes, and her fugitive articles are as a rule upon burning topics, the questions by which men's minds were most exercised at the time. Indeed, though she lived by the pen, no writer ever wielded it with greater independence and single-mindedness. What she says of herself in the autobiographical sketch already referred to is most true, "her stimulus in all she wrote from first to last was simply the need of utterance." And in her resolve to keep that utterance perfectly free she again and again refused offers of a pension from the civil list.

Of her quiet courage perhaps the most memorable example is her conduct in the angry discussion which took place over her recovery from a dangerous illness in 1844 by means of mesmerism. The story was published at first without her sanction, and soon the fight over it raged fiercely in the scientific world. Misrepresentation as usual abounded, so she came forward and stated what really happened, with the views derived from her own experience of mesmerism as a curative agent. This drew upon her, as she truly says, "an amount of insult and ridicule which would have been a somewhat unreasonable penalty on any sin or folly which she could have committed." To friends who pressed her not to publish, foreseeing what it was likely to bring on her, she simply replied that it was hard to see how the world could be ripened if experimenters in new departments of natural philosophy concealed their experience.

Her main work was done before the present generation of readers can remember, but those whose memories carry them back to the time of the first Reform Bill, and whose opinions on political and social questions were forming in the uneasy years which followed, will readily confess their debt of gratitude to her. For she did more than any other writer, not excepting Archbishop Whately, to bring home to them the fact that the questions which political economists were discussing, and especially those connected with the Poor Laws, were not mere abstract problems for philosophers to argue over, but issues involving the welfare of every member of society. As one writes the words now they seem to express a mere truism, but that this is so is due in no small measure to her. And she rendered that generation of readers a yet higher service by the tone of these social and economic writings. They are, we think, the first popular works of a class now so common, distinguished by a genuine and discriminating sympathy with the hopes and aims of the poor, and an understanding of their trials and temptations. The improved tone of thought and feeling on all social questions has arisen from many causes, and is due to many workers, but of these none have been more earnest than,

and few so successful as, Harriet Martineau. Her forthcoming Autobiography will be looked for with deep, if somewhat painful interest, for it is to contain "a full account of her faith and philosophy." In the sketch already referred to she tells us that the cast of her mind was "more decidedly of the religious order than any other, during the whole of her life," and that "her latest opinions were in her own view the most religious;" and at the same time "that she was not a believer in revelation at all" in her later years. Her firm grasp of her own meaning, and her singular power of expression will probably stand her in good stead in making her faith, whatever it may be, clear to those who have never yet been able to understand it. In any case it must command the most respectful attention, for even if not the motive power in, it was at least consistent with, a singularly noble and courageous life.

T. HUGHES.

MM. ASSÉZAT AND G. AVENEL.

Two distinguished journalists and men of letters have just died at Paris, M. Assézat and M. G. Avenel. M. Assézat devoted his special attention to the men of the eighteenth century. He sought to rescue some of the most utterly forgotten of their number from the obscurity into which they had fallen, and published editions of La Mettrie's *L'Homme-Machine* and *Les Contemporains* by Rétif de la Bretonne. Very recently he undertook a work on a great scale, with which his name will ever be associated—an edition of the Complete Works of Diderot, of which fourteen volumes have appeared under his superintendence. He has incorporated a very considerable number of unpublished works, and has added prefaces and notes which show vast learning combined with sound judgment. M. Assézat was likewise a highly-esteemed contributor to the bibliographical department of the *Débats* and the *République Française*.

M. Georges Avenel was only forty-eight. He was a devoted partisan from his youth upward of Republican ideas, and spent the whole period of the Empire in studious retirement, only writing a few occasional articles for the papers. The Revolution was his special subject, and he had a thorough knowledge of its minutest details. In 1865 he published his great work on Anacharsis Clootz, which gained him a great reputation with the democratic party. He held a small post during the siege of Paris, and in 1871 became attached to the staff of the *République Française*, to which he contributed an article every Monday on the revolutionary period. He has since published a considerable number of these sketches in a volume entitled *Lundis Révolutionnaires* (Leroux), and one of them has appeared separately under the title of *La Vraie Marie-Antoinette*. M. Avenel was not only a man of noble character, he was also a writer of talent, and his style was vigorous and original; but the want of calmness and impartiality and of strictness of method prevented him from being a historian in the true sense of the word. He never quoted his authorities, and did not select them with critical exactness. He did not belong to the great positive and scientific school which has renewed historical studies in our days; a free-thinker in religious matters, he was a mystic and a devotee in all that concerned the memories of the Revolution: only, instead of setting up a single idol as M. Louis Blanc and M. E. Hamel have done, he burnt his incense almost indiscriminately before all the actors in the great drama, and transformed their struggles and their enmities into simple misunderstandings.

G. MONOD.

NOTES OF TRAVEL.

LETTERS from Khartum bring the intelligence that Mr. Lucas' expedition, referred to in the ACADEMY of April 8, has left that place in a flotilla of boats making its way up the river to

the Bahr el Ghazal, which is to be the base of exploring work to westward of the Albert Nyanza.

It is remarkable that the letters from the members of the Egyptian Expedition who lately circumnavigated the Albert Lake make no mention of Mr. Stanley; and this leads to the belief that he must have altered the plan laid down in his letters from the Victoria Lake in April and May, 1876, by which he intended to return to the Katonga valley, and thence, after having paid another visit to Mtesa, to march directly west for Lake Albert, hoping to meet some of Colonel Gordon's gallant subordinates there.

THE second part of Lieut. Cameron's "Sketch of a Journey across Africa" in *Good Words* will be read with much interest. It describes his boat voyage round the Tanganyika, and the journey westward from the lake to the Manyéma country, and the Lualaba at Nyangwe. The sudden change of scenery, people, and customs noticed by the traveller after passing the mountains of Bambarre and descending into Manyéma recalls the similarly well-marked contrast observed by Dr. Schweinfurth in passing over the water-parting between the Nile tributaries and the basin of the Uelle, and suggests a continuation of the same great natural divide. Cameron's identification of the nomadic Watuta, a peculiar people of the eastern side of the Tanganyika, with the Mazitu, found by Livingstone on the north-west of Lake Nyassa, is also an interesting point.

THE last number of the *Explorateur* contains an important sketch-survey and description of the river Volta, the boundary river of the British possessions on the West African Gold Coast, for about 200 miles from its mouth upwards, the result of an expedition led by M. J. Bonnat. The rapid of Laballe, near the farthest point examined, is the most formidable obstruction to the passage of the river, the difference of level above and below the cataract in the dry season being twenty-five feet in a distance of 700 yards. During the rains, however (September and October), the river rises fifty feet, and the rapids would then be easily ascended by a steamer.

PROF. MONIER WILLIAMS'S two lectures on India, delivered last term at Oxford, have already been referred to in the ACADEMY. They were a record of the impressions made upon him in his recent travels in the country. After showing how the gigantic barrier of the Himalayas on the north caused the early geographers to imagine that India was a circle surrounded by the sea as well as occasioned that preservation of primitive Aryan customs and modes of speech which strikes us in Hindustan, he went on to state that the number of different languages in India may be estimated at twenty-two. He had been much surprised at the ease and fluency with which the extinct Sanskrit was still spoken by the learned classes throughout the country. He had been equally surprised at the sight of the 10,000 school-children assembled at Bombay to welcome the Prince of Wales, who, though drawn from the middle ranks, were yet all, boys and girls, dressed in rich silks, satins, brocades, and velvets of all colours, with gold-embroidered caps, and jewels of great value on their feet and arms, necks and ears. His visit to a village community had impressed upon him the fact that Hinduism was a system of compensations. The Bhanji, a man of the lowest caste in Gujerat, might be despised by a Brahman and his touch and very look be avoided by him: yet the Bhanji had his revenge. The Brahman was omnipotent during the day, his blessing made rich and his curse withered; but the moment the sun went down and darkness set in he became powerless for good or evil. The tables were then turned, and the power of the Bhanji of Gujerat began. This was curiously displayed in some supposed power over the fords of rivers. No Gujerati Brahman would cross a ford after sunset until he had asked permission of a

Bhanji. Prof. Williams regarded the Hindus as essentially a religious people. Religion enters into every action and relation of their life. No hardships can deter the Hindu from pilgrimages and visits to his sacred shrines. The orthodox creed of Brahmanism is self-extinction, the absorption of the individual into the Universal Soul. This universal essence or Brahma manifests itself throughout the world. God is all visible form, and all visible form is God, and hence stones, rivers, mountains, plants, trees, animals, and men are but steps in the infinite evolution of his being. The cow typifies the all-yielding earth, the serpent is the symbol of eternity, and hence the sacredness of these two animals. Even astronomy is made to subserve the cause of Pantheism. The use of idols is defended on the ground that they are mere reminders and frighteners, to aid the faith of the good and to rouse the fears of the bad; they are not themselves divine beings. The uneducated masses of the people, however, do not observe this distinction between symbol and reality. But idolatry is breaking down on all sides, and the only two religious refuges that the Hindus have before them are either Theism or Christianity.

LETTER FROM EGYPT.

Cairo: May 29, 1876.

It will interest those who have visited, and still more those who intend to visit, the land of the Pharaohs, to hear that Mariette Bey is about to establish, with the sanction of the Khedive, a library at Thebes, in which books of travel, histories, guides and maps, and all publications that are likely to be of value and interest to travellers, will find a place. In future seasons, therefore, a sojourn at this centre of interest in Upper Egypt will be made under more favourable circumstances than hitherto. Further, Mariette Bey intends to provide the Nile steamers of Messrs. Cook with small libraries, which will contribute greatly to the convenience of those—and their number increases yearly—who explore Egypt under their guidance.

There are many here who believe that the upper country is destined shortly to become the most favoured resort of invalids, for whom, they allege, the climate of Cairo is becoming too cold and changeable. However this may be for the generality, it is certain that there are many complaints for which the equable winter temperature of the more southerly districts is more beneficial than that of Cairo. Therefore all success is to be wished to the Sanatorium which the enterprise of Messrs. Cook is about to establish, according to their late announcements, at Philae.

Mariette Bey has also decided to prepare for publication an abridged edition in English of the Boulak Catalogue, which will be fully appreciated by those travellers who cannot read French with facility, and by flying visitors, whose hours are limited, and who shrink from the formidable-looking French edition. Such a work has long been a desideratum, and, coming from the pen of Mariette Bey, it will be hailed as a welcome supplement to his former publications. M. Mariette has always—and this is a further proof of it—had the interest of English travellers and visitors to the museum at heart. Those who have had the rare pleasure and advantage of going through these rooms at Boulak under his guidance, and who have experienced his extreme and well-known courtesy, will always look back upon the hour thus spent as one of the most profitable and agreeable that they passed in Egypt. There is a peculiar charm in hearing him speak, since there is no one, perhaps, who possesses in a fuller degree the happy gift of throwing the most vivid descriptions of the remote past into a most attractive and fascinating form. And so, as you close your catalogue, of which he is the author, and listen to his own words, ancient Egypt seems in very reality to live again before your eyes and

before your mind. The museum has become peopled with animate beings. Marble and granite begin to find a voice in all their sculptured forms. The mummies seem to rise from their massive sarcophagi, or descend from their glass cases, to narrate in detail their lives, confessing their sins, and explaining the mysteries of their religious and social system. Here at Boulak, at any rate, their memories appear to be excellent; for—save that they maintain a little reserve as regards chronology—they are never at a loss to answer any questions with which you may endeavour to puzzle their lately slumbering faculties. They recount their pleasures and their pastimes, as well as their labours and their grievances; and they smile reproachfully as they remind you how much they have been misunderstood until Champollion and Mariette discovered how to conjure them from their tombs and call them to account. Thus, when they have discussed all the objects that fill the cases of Boulak, they have shown you how closely M. Auguste Mariette has approached to lift the fringe of Isis' veil; and, in fact, they have pretty well explained themselves, and their periods, and their dynasties, to the satisfaction of all parties.

It is thanks to the great kindness of Mariette Bey that I am now able to mention the additions and alterations just made by him at Boulak in consequence of the important recent discoveries, to the investigation of which he has of late been devoting so much of his time. The result has been the entire re-organisation of all monuments classed as historical. This arrangement, while it is of the highest interest to the general public, is of such scientific importance that the collection of Boulak (which contains the most valuable monuments that exist for the determination of the chronological history of ancient Egypt) may be said to enter upon a new epoch of its existence. The additions which call for special attention are:—

1. A case in which a collection of small objects—chiefly scarabs bearing royal cartouches—are placed in chronological order, in illustration of the entire series of dynasties.

2. A group of royal heads, sculptured in granite and other materials, which are all remarkably interesting. The one, however, which demands special attention is that of a king of the name of *Smendis* (XXI. dynasty). This is a name hitherto unknown; Mariette Bey has, therefore, not only added a new king to the records of this dynasty, but has also adorned Boulak with his royal portrait. This *Smendis* was, says Mariette Bey, a king who ruled at San (the biblical Tanis) at a period when the upper country was governed by the chief priests of Amon at Thebes.

The present may be deemed a fitting occasion to mention briefly those monuments, as re-arranged at Boulak by Mariette Bey, which he considers to be of the highest historical importance. It is needless to observe that many of the objects in the museum which are of the highest value from a scientific point of view are such as to attract small notice from the public in general.

As no monuments, unfortunately, have up to the present time been discovered illustrative of the first and second dynasties, the records of the third come first in order.

Dynasty III.—The chief monuments of this period are the two statues of Meydoun (from the necropolis that encircles the "False Pyramid" so named). These represent a Prince Ra-hotep, and a Princess (wife or sister) Nefer-t, who lived in the time of Snefrou, last sovereign of the third dynasty. "At no epoch," says Mariette Bey, "has Egypt produced more speaking likenesses than in the case of these statues, which reveal such perfection in art at a period prodigiously remote . . . Lastly," continues the catalogue, "we must allude to the importance of the statues of Meydoun from an ethnographic point of view. If the Egyptian race was of the type which is here presented, it must be admitted that it bears no

resemblance whatever to the race which inhabited the North of Egypt a few years only after Snefrou. To gain an idea of the problem which we here suggest we have only to compare these statues of Meydoun with those in the museum of the fourth and fifth dynasties."

The other remarkable monuments are portions of two façades of a tomb, also at Meydoun, which was that of a family living at the same remote period, just anterior to the dynasty which reared the Gizeh Pyramids. The fragments of these façades are painted in vivid colours upon an outer coating of stucco. We see a group of geese, half life-size, in which the execution of detail and the preservation of colour is striking in the extreme, when we consider that these are absolutely the oldest Egyptian monuments in the world, having attained, according to the chronological tables of Mariette Bey, the very respectable age of about 6,200 years.

Dynasty IV.—The chief monument is the large statue, in diorite, of Chephren—builder of the Second Pyramid of Gizeh. The other monuments include the *débris* of various statues of Chephren, recently added to the collection by Mariette Bey, and now placed in the garden of the museum; and two large sarcophagi, which are those of two sons of Cheops.

Dynasty XI.—The "Tablet of Antifaa II." This is a royal stela, coming from a small pyramid at Thebes. It was the subject of a memoir read by Dr. Birch on March 2, 1875 (*v. Transactions of the Society of Biblical Archaeology*, Vol. IV., Part 1).

Dynasty XII.—Various statues of queens from Tanis.

A colossal statue, in black granite, representing a king of this dynasty, and one of the finest specimens of Egyptian art. The name of Ramses II. has been subsequently inscribed upon the statue.

Numerous royal stelae, which record events in the lifetimes of kings and of private individuals of the XII. dynasty. These records possess great historic value, inasmuch as such biographies furnish dates, or at any rate facts, which aid in fixing the chronology of the period. For instance, in some cases, it is recorded of such or such an individual that some event took place in the lifetime of a certain king; while another event, such as his death, took place in that of a successor. These tablets are not yet described in the catalogue.

Dynasty XIII.—Various records of kings, chiefly from Thebes and Abydos. One royal stela, bearing the name of a King Nefer-hotep of Abydos, is of an interesting character. It records that a visit was paid by Nefer-hotep to the library of the Temple of Osiris at Abydos, on which occasion the MSS. were found to be in a sorry condition of neglect. Orders were, therefore, given by the king to replace the MSS. by fresh copies, and to place the library under repair.

Dynasties XV., XVI., XVII.—Period of the Hyksos, during which the Shepherd Kings ruled in Lower Egypt, while the legitimate kings held dominion in the upper country.

It is at this point that the discoveries of Mariette Bey have been of such extreme importance in bringing to light various names and events that illustrate this portion of the history of the now divided kingdom. The monuments of this epoch with which Mariette Bey has enriched the Boulak Museum invite special attention, since they speak of a period respecting which the museums of Europe are silent. The chief of them are as follows:—1. Sphinxes, and especially statues of two kings, who stand upon the same pedestal, and hold in their hands water-fowls and various fish, together with the flowers of the plant called "bushin." These are described by Mariette Bey as undoubtedly representing two of the Shepherd Kings. Another name, that of Psousennès, had been added, as is so often the case, at a subsequent period. As regards the type of physiognomy, "the features are hard and unprepossessing, and bear a strong resemblance to

the lion-maned Sphynx of the same epoch. The upper lips are shaven, but the cheeks and chin are covered with an abundant growth of wavy hair. The heads are covered with huge wigs, arranged in coarse tresses." 2. From Thebes, various objects illustrating the domination of the kings of Upper Egypt who were contemporary with the Hyksos ruling in Lower Egypt. Among them is a long wooden sword, bearing the name of one of these kings.

Dynasty XVIII.—Great period of Renaissance—a period richly illustrated in all the collections of Europe; especially, as regards important historical monuments, at Turin. What is noticeable at Boulak is the collection of gold ornaments and jewels, which always attract so much attention from visitors. They were the property of a queen who lived at the beginning of the eighteenth dynasty.

Dynasty XIX.—The celebrated "Sakkara Tablet," engraved on both faces, of a priest of Memphis, named Tounar-i, who died in the reign of Ramses II. It is the list of fifty-eight kings inscribed upon the outer sepulchral chamber of this priest that is so valuable in confirming, as far as it goes, the lists of Manetho. (Mariette Bey, *Notice des Princip. Monum. à Boulak*, No. 916, p. 280, 1874.—*Revue Archaeol.*, Nouvelle Série, tom. ix., p. 169.)

Dynasties XXII.-XXVI.—This was a period enveloped in complete obscurity until the publication of the results of the excavations conducted by Mariette Bey at Gebel Barkal (the Biblical Noph: the Napata of Strabo) threw entirely new light upon what was before a region of mere conjecture.

The chief monuments consist of five stelae, which furnish information concerning the flourishing Ethiopian Empire formed in the "Soudan"; which, having been annexed to Egypt in the XVIII. dynasty, adopted the civilisation of the conquering race. Then, during a period beginning with the XXII. or XXIII. dynasty, it became the rival of its former conqueror, and subsequently brought under subjection all Egypt to the shores of the Mediterranean; so that the symbols of a double royalty were combined in the persons of its kings. The five tablets appear to furnish rough outlines for a historical sketch that would portray the rise, the grandeur and supremacy, and finally the decadence and re-isolation of this great Ethiopian Empire. The *résumé* of their contents is to be found in some of the most interesting pages of the *Boulak Catalogue* (*Notice*, &c., Nos. 917-921.—pp. 917 seq.).

ROLAND L. N. MICHELL.

THE PROPOSAL TO ASK A UNIVERSITY CHARTER FOR OWENS COLLEGE, MANCHESTER.

THE Senate of Owens College have kindly forwarded to us copies of their own pamphlets, advocating the elevation of their institution into a university, together with the letters they have received from a number of private friends, specially interested in academical education, on the same subject. Whatever opinion may be taken as to the merits of the scheme, there can be no dispute that the Senate, who appear in this matter as identical with the professorial staff, have followed the most desirable course to obtain a critical consideration for their proposal. In the pamphlets they have the opportunity of stating their own case with all the authority and experience that their position can give; and it may be assumed that they have omitted no evidence and no arguments which are either felt in Lancashire, or calculated to convince the public tribunal to which they appeal. In answer to these pamphlets they have received from a list of friends, who command attention both from their number and personal distinction, an independent body of suggestions supporting or criticising the proposal communicated to them. No better method could be adopted for elucidating

all the aspects of the question, discovering its probable consequences, and revealing the dangers and difficulties to which it is exposed.

The proposal is no other than to found a new "national university, enjoying the right of conferring its own degrees;" and to incorporate Owens College as at present constituted, and Owens College alone, as that new creation. For the due consideration of such a proposal it is evident that wide information and much discussion is required. It will be necessary to arrive at some agreement as to the proper conception of a university, and to discover how near the present tendencies of the Manchester College permit it to approximate to that ideal; as well as to settle the minor question, whether the multiplication of independent degree-giving institutions is desirable in England at the present day. It is not, of course, surprising that the local professors show a disposition to answer this last question in their own favour, and to rest the strongest part of their case upon that affirmative answer. They are profoundly dissatisfied with the examination-system of the London University. The proportion of their students who adopt the regular three years' course, accommodated to the London examinations, is "comparatively small, and shows a tendency still further to diminish." They object, also, to the principle of their students being examined by an alien body, in the organisation of which they have no part; and they give in their adhesion to the dangerous theory that the work of teaching and that of examining should rest, if not in the same hands, at least under the same control. The number of professors and lecturers (exclusive of the Medical Department) now amounts to thirty, and it may possibly happen that the present incumbents are adequate to the new duty which they seek to impose upon themselves; but in the interests of their successors it is well to recall to mind Mr. Lowe's apologue, that "it is bad housekeeping to set the cat to watch the cream."

With regard to the more important question, which turns upon the meaning we should attach to the word "university," the papers now lying before us do not carry the discussion very far. It is something, however, that the friends of Owens College are unanimous in their protest against the insidious theory, which once threatened to become popular, that the functions of a university are limited to the holding of examinations, and the conferring of degrees. This outward mark of a university is the very thing that the Senate is desirous to obtain; and it may fairly boast that it possesses already certain other academical attributes: a common curriculum for the students, regular attendance at lectures, adequate buildings, permanent endowments, a corporate enthusiasm, and a distinguished and industrious staff of professors. But, granting all this, those who are most familiar with the ideals of modern university reformers, and with the Continental practice, cannot but feel that there is yet one thing lacking. Where is the guarantee for the maintenance of that universality of studies, that due proportion between Arts and Science, and between research and teaching, without which a university may sink into a mere union of technical schools?

The Senate of Owens College, indeed, argue that when once the privilege of conferring degrees is conferred, the prestige of the new title, operating upon the proved capacity of the students and teachers, and also upon the municipal enthusiasm of Manchester, will insure that all the manifold developments of academical life will gradually unfold themselves in their new home. To not a few persons, we fear, these hopes will appear visionary; and adverse critics will naturally be tempted to throw out the taunt that Owens College desires a university charter in order that it may use the name to help itself to become that which the name has already presupposed. On this point it would be impossible to improve upon the warning of Prof. Huxley, whose letter forms the most

valuable of the contributions to which this proposal has given rise:—"A university is, in my judgment, a corporation which has charge of the interests of knowledge as such, and the business of which is to represent knowledge by the requirements of its members, to increase knowledge by their investigations, to diffuse knowledge by their teaching." That such institutions might advantageously be multiplied over England, and that Owens College "may fitly expand into a university," Prof. Huxley has no doubt; but he pertinently questions the relevancy of the tacit assumption that Owens College should insist, as an essential step towards this end, "upon branding its own herrings."

Herein lies the gist of the whole matter. Universities are not made, but grow. The Manchester College, by private endowment and local energy, can elevate itself to any height which it pleases in the academical scale; and, when it has thus become a university, no one will then refuse to it the name. Yet further, when that time has come, there would be no objection to its being placed by the State on a level with the universities that confer degrees, provided that it is still desirous of the privilege, and that such institutions continue to exist. In the meantime, the present proposal appears to us premature. The foundation of a new degree-conferring body is not, even politically speaking, a problem to be settled offhand. The evils caused in the United States by the excessive multiplication of universities are too formidable to be disposed of in a brief footnote. France has not yet made up her mind upon the question. The examples of Germany and of Scotland are of doubtful import; while the experience of England herself during the present century at Durham and London, as well as in Ireland, is of such a nature as to make statesmen pause before they meddle with the subject afresh. SCIENCE.

Ethical Studies. By F. H. Bradley, Fellow of Merton College, Oxford. (London: Henry S. King & Co., 1876.)

"DOGMA is more pleasant than criticism, and as yet we have no English philosophy whose basis is not dogmatic." These words indicate the spirit of this remarkable volume

of essays. Mr. Bradley's aim is in the first instance Socratic, to make the prevailing philosophies of this country conscious of their own assumptions. Not that he leaves us without positive results; on the contrary, he gives a tolerably complete outline of a system of Moral Philosophy such as he conceives it, and also, to some extent, explains the method and principles upon which it must be constructed. Still, on the whole, what he attempts is, not so much to discuss the metaphysical difficulties that underlie his own and every other view of morals, as rather to show that these difficulties are there to be discussed, and that in most cases they have not been discussed, but ignored. The critical spirit, the spirit that is constantly on the alert to detect the presuppositions of its own assertions as well as of the assertions of others, is what Mr. Bradley calls for, and I think it may be fairly said that in this volume he has exemplified what he requires in others.

The question discussed in the first essay of the volume is whether either of the two prevailing theories on the nature of the Will corresponds with or explains the ordinary views of moral responsibility. The necessitarian theory is often asserted by its adversaries, and sometimes admitted by its supporters, to fail in this respect. But Mr. Bradley shows that the opposite theory of mere Indeterminism is equally defective. The ordinary moral consciousness has no objection to rational prediction founded upon character, as it must have if the liberty it implied were pure liberty of Indifference. On the other hand, there is a kind of prediction at which it would undoubtedly revolt:—

"I believe that if, at forty, our supposed plain man could be shown a calculation made by another before his birth, of every event in his life, rationally deduced from the elements of his being, from his original natural endowment, and the complication of circumstances which in any way bore on him—if such a thing were possible in fact, as it is conceivable in certain systems, then, I will not go so far as to say that our man would begin to doubt his responsibility; I do not say his notions of right and wrong would be unsettled (on this point I give no opinion); but I believe that he would be most seriously perplexed and, in a manner, outraged" (p. 14).

Now, what is the distinction between the cases where prediction is welcomed and those in which it is repelled? Mr. Bradley answers that the "plain man" does not object to any one foretelling what he will do from what he is, but that he does object to the foretelling of that which he will do on grounds that are independent of, and prior to, his very existence. He is horrified to find "the qualities of his being deduced from what he is not himself." "If another can thus make and remake him, he himself might just as well have been somebody else from the first, since nothing remains which is specially his." "The possibility of the explanation of his self, means that his self did not exist at all." Now, is this a rational state of mind on the part of the plain man? Mr. Bradley again answers that it is rational, if the self be more than the collection of its states, or, what comes to the same thing, if it is more than a mere resultant of elements which existed before

in an independent form. If the self involves any higher integration than this, then there is no possibility of prophesying its actions from the nature of its elements, and the "plain man" has a right to object to the idea of such a prophecy. In a manner which is full of humour as well as of sound logic, Mr. Bradley shows that the common mechanical explanation of mind by the action and reaction of its elements is absurd and self-contradictory, and that it has absolutely no relation to the facts which it proposes to explain.

The second essay treats of the question, "Why should I be moral?" and begins by showing that, as thus put, the question involves the assumption that morality is a means. No ethical theory can assume to be better than another because it asserts that there is an end, for all ethical theories must do that. Mr. Bradley, perhaps, does not sufficiently consider that a great step is gained when it is asserted that there is one end, and that some of the theories he opposes are of practical value as against mere scattered judgments of ordinary moral feeling which claimed absolute authority. However imperfect its conception of the end might be, Benthamism was strong in its recognition that there must be a unity of principle in morals. The end is then defined as self-realisation, though, as usual, Mr. Bradley warns us that there are assumptions involved in this definition:—

"How can it be proved that self-realisation is the end? There is only one way to do that. This is to know what we mean when we say 'self' and 'real' and 'realise' and 'end'; and to know that is to have something like a system of metaphysics, and to say it would be to exhibit that system" (p. 59).

But the critical purpose of the essays (and not, I think, the incapacity of the author, though *Socratically* he is modest enough to say so) excludes such an investigation, and therefore he contents himself with explaining what is involved in the idea of self-realisation, and with a reference to the psychological impossibility of pursuing an end which is not in some sense identical with the self. But then this self-realisation, if it is to be the end of action, must be something which can be regarded as a whole with interdependent parts, it must be a system that is built up by our actions as life goes onwards—and, indeed, as it is a system in which everything must be included, an infinite system. [The reader whose common sense is alarmed by the last phrase should consider Mr. Bradley's explanations (pp. 68, 74); perhaps it may be sufficient here to remind him of Aristotle's *τέλειον* and *αὐταρκές*.] Now, where is such an end to be found? In the two following essays it is shown that it cannot be found either in "pleasure for pleasure's sake," for pleasures are isolated moments of feeling that can never be accumulated or gathered into a whole; nor again, where Kant sought it, in "duty for duty's sake," for the mere abstract universal of will, as such, is incapable of realisation. The latter theory Mr. Bradley dismisses shortly, as it has not attracted much attention in this country; the former he discusses with great fullness and vivacity, especially that modern form of

it which he calls the "Utilitarian monster." In the fifth essay, on "My Station and its Duties," he begins to show where the moral system is to be found. In doing so he first points out that there is involved in almost all the English systems of morality an assumption of Individualism which would require to be metaphysically proved. For himself he declares that he will make the opposite assumption, that the individual as such is an abstraction who is real only in and through his relations to society, and he points out that this assumption is supported by the facts of ordinary experience, and by all that we are beginning to know of the development of mankind. If, however, the truth is to be sought in this direction, then we must look for self-realisation in the first instance to social life, and adopt the old Greek maxim that the best moral education is to be the citizen of a good State. "Goethe has said 'Be a whole, or join a whole,' but to that we must answer, 'you cannot be a whole unless you join a whole'" (p. 72). The first and greatest element of morality for the individual in most cases is to make himself into an organ for one of the functions of society, it being remembered that an organ conscious of itself as an organ is no mere external instrument of a purpose with which it has nothing to do. Thus the individual contributes to build up a system, in which he is realised and which is realised in him, which exists *within* him, as a character developed out of the elements of nature and circumstance, and *without* him, as a civilised and organised society. On the other hand, it is not the whole of morality for the individual to be in harmony with the realised morality of the society in which he lives; for, in the first place, man is progressive, and therefore cannot get rid of the division between what is and what ought to be. Any given form of society has in it a contradiction with itself and with the ideal of social life, a contradiction which becomes more manifest as the society grows to maturity, so that morality may consist, and in periods of transition the highest morality *must* consist, in rebellion and not in obedience. And, in the second place, there is a region of Art and Science, a region to which much of our highest life belongs, but yet which cannot without sophistry be brought within the compass of social morality either in its ideal or real form. Connected with this is the question of the relation of morality to Religion; for morality consists in the effort after an ideal which is imperfectly realised by the individual, and religion involves the anticipated enjoyment, by faith, of this ideal. Religious faith, in fact, rests in the ideal as realised, and *therefore* seeks to realise it. In his concluding remarks, Mr. Bradley explains this apparent contradiction. Lastly, in another essay which we have passed over, he examines the ideas of self-sacrifice and selfishness, and the supposed impossibility of the former because "pleasure is always the motive of action," and makes some remarks on the nature and development of the consciousness of moral good and evil.

This short sketch of the contents of Mr. Bradley's volume will, I hope, be enough to show that the ideas it contains are, if not

entirely new, at least such as have never been considered with attention by the principal schools of philosophy in this country. Mr. Bradley, however, is not only in possession of thoughts that have not yet become common, but he has a very remarkable power of putting them in a clear and palpable shape; and it is to be hoped that his challenge will not pass unnoticed by those whom it concerns. Certainly neither Mr. Bain (pp. 36, 238, 241, &c.) nor Mr. Sidgwick (p. 114); neither Mr. Matthew Arnold (p. 281-4) nor Mr. Harrison (p. 305) can quite safely disregard what he has said about them. He has written a book which is full of suggestion, and the only criticism I shall venture to make is that "dolus latet in generalibus," and that I hope he will soon endeavour to demonstrate more thoroughly and fill up with more fullness of detail the outline which he has so ably drawn.

EDWARD CAIRD.

Specimens of Greek Dialects: being a Fourth Greek Reader, with Introductions and Notes by W. Walter Merry, M.A., Fellow and Lecturer of Lincoln College. (Oxford: Clarendon Press, 1875.)

Fifth Greek Reader. Part I. Selections from Greek Epic and Dramatic Poetry, with Introductions and Notes by Evelyn Abbott, M.A., Fellow and Tutor of Balliol College. (Oxford: Clarendon Press, 1875.)

THE title of these books seems to mark them out as part of a series, but as the first three parts are not yet published, and the introductions to these volumes do not give us any information about their contents, we are unable to speak of the series as a whole. Mr. Abbott, however, tells us in the preface to the *Fifth Greek Reader* that his selections "are intended to give help to those who are just beginning the study of the more difficult parts of Greek literature." We therefore presume that the *Fourth Greek Reader* is intended for students in a still more elementary stage of progress. It is from this point of view that we must regard it. Schoolmasters cannot be otherwise than grateful to such scholars as Mr. Merry and Mr. Abbott for condescending to edit books for schools, or to the University Press for the handsome type and general appearance of these volumes, although these luxuries must necessarily be paid for by the purchasers of the books. But they cannot, at the same time, forget that these are school-books intended for practical use, for boys and not for masters only, and it is as school-books that we must review them. We are tempted at first to ask, why have a special Reader in dialects at all? and, if it is desirable to have one, why not place it at the very end of your course and not before a reading-book which is intended for those who are just beginning the more difficult parts of Greek literature? This question has, however, in all probability been decided by a superior authority to Mr. Merry and Mr. Abbott. "Vuolsi così colà dove si puote ciò che si vuole"—we have only to consider in what manner the editors have performed their task.

Mr. Merry's work opens with a general sketch of the Greek dialects, an admir-

able essay of twenty-four pages; it is followed by another essay on the question, "What is the relation of the different dialects to different literary styles?" Both these are excellently written, full of information, containing the last discoveries. The second essay, especially, is not only instructive but ingenious. Yet a long experience leads us to believe that very few schoolboys would understand a word of it. The first batch of extracts refers to the Epic dialect, and consists of a string of passages from the *Iliad* connected by a running narrative. Any one who reads it will have a view of the *Iliad* as a whole and be acquainted with some of the most beautiful as well as some of the hardest passages in the poem. We should think it very useful to those who wished to get up the hard passages of their *Iliad* for Moderations. But we fail to see what place these extracts have in a *Fourth Greek Reader*. It would we conceive be a good plan to publish a separate book containing an abstract of the *Iliad* in the manner here indicated, and we could not wish for a better editor than Mr. Merry; but these extracts answer no useful purpose—they are too short, they are too hard, and they are apparently not chosen with the view of presenting a continuous narrative. The introduction, excellent in itself, is also far beyond the reach of those for whom it must be intended. These extracts are followed by another learned and elegant dissertation on the Ionic dialect and its relation to Attic, which introduces us to about ninety pages of extracts from Herodotus, connected by a running narrative as in the case of the *Iliad*. Again we ask, would it not have been better to make these longer, and to treat them as the foundation of an independent book? These are followed by remarks on the Aeolic dialect, leading to two extracts from Sappho, and two from Alcaeus. "Que diable," we must ask, "vont-ils faire dans cette galère?" What conceivable schoolboy in the position to profit by the extracts from Homer and Herodotus would gain any advantage by reading Sappho and Alcaeus? The book is concluded by an account of the Doric dialect, a few idylls of Theocritus, and two exquisite poems of Bion and Moschus. These are nearly as unsuitable for beginners as the Sappho and Alcaeus. We cannot help offering our advice with all humility to Mr. Merry and the Delegates of the University Press that the book should be recast. We should thus have four good books instead of one bad one: (1) a work on Greek dialects, containing Mr. Merry's essays and introductions amplified, and sufficient extracts to make his remarks intelligible. (2) A reading-book from the *Iliad*. (3) A reading-book from Herodotus. It is surely unfair and misleading to treat these great authors as if they were merely examples of deviations from the Attic standard. (4) A reading-book from the Greek lyric poets and the anthology, which is wanted at schools more than anything else just now. Mr. Merry could take as his foundation the second part of the old *Eton Poetae Graeci* and the *Anthologie* of Dr. Buchholz, published by Teubner, of Leipzig. We would not wish for a better editor of these books than Mr. Merry. The

notes which occupy the last 150 pages of his present volume are everything that could be desired—clear, painstaking, learned, accurate, and interesting. We only regret that so much labour should have been expended on a book which, as far as we can see, will be of so little use to those for whom it is intended.

Of the *Fifth Greek Reader* we are able to speak with more praise, not because it is superior, or even equal, in workmanship to Mr. Merry's book, but because it appears to fulfil more adequately the end for which it is written. It contains extracts from Homer and the Greek dramatic poets. The shield of Achilles from the *Iliad*, and the interview of Odysseus with Eumaios are apparently thought sufficient specimens of the style of Homer. We should have supposed that the *Fourth Greek Reader* had made any extracts from the *Iliad* superfluous, and that Mr. Abbott might have given us something more characteristic from the *Odyssey*, and a larger amount of it. The other extracts are well chosen, except that the anapaestic dialogue of Hermes and Prometheus is too hard for the boys for whom this book is prepared. We are especially glad to observe extracts from the *Cyclops* of Euripides and from Aristophanes. The exquisite style of the latter author, as well as the infinite humour and vigour of his satire, makes him especially appropriate to excite a love for Attic literature and language. It is not at all difficult to compile a Reader from his plays which will be at once easy and amusing. One-third of the book is occupied by the text, the remaining two-thirds are devoted to introduction and notes. It will be understood that these notes are extremely ample, but not, we think, too much so. They probably give a boy all the assistance he needs without the use of a dictionary. As far as we have examined them they appear to be accurate and good, but their excellence is marred by a certain *naïveté* and simplicity which sometimes even suggests a doubt of the perfect finish of Mr. Abbott's scholarship. Students of a Fifth Reader scarcely need to be told that *ποιήσατο* = *ἐποίησατο*, or that "the augment appears to be omitted at pleasure in the Homeric poems." And surely a boy who has religiously observed the course which the Delegates of the University Press have prescribed for the creation of the accomplished Grecian, and have read, marked, and learned Mr. Merry's Fourth Reader on Dialects need hardly be told that *σείο* = *σού*. Mr. Abbott is much too fond of talking about "tnesis," and telling us that certain words are understood or "to be supplied." We imagined that this method of explaining constructions in literary works was now quite obsolete, and that we had come to the conclusion that the great Greek writers knew better than ourselves what words were necessary for the force and clearness of a sentence and what were not. The introductions to the various parts of Mr. Abbott's book are written with great skill and finish. Indeed, the only criticism we have to make upon them is that they may be too hard for the learners. A boy just going in for an open scholarship at Oxford could not find a better example of what a

literary essay should be, and we have no doubt that they will awaken the taste and interest of many who might otherwise have regarded their study of the classics as mere routine. On the whole, we can conscientiously recommend Mr. Abbott's book to the attention of schoolmasters, although we fear that from its size and style it cannot be a cheap book. But we feel ourselves bound to express our opinion on both the books before us, regarded as part of a course for beginners in Greek. Surely if a great University publishes officially a series of handbooks to a language, competing with those which private enterprise has produced, it ought to feel that it is acting under a strong responsibility, and that the guarantee of its name and prestige is likely to be held sufficient, especially in those places where information at first hand is not easily attainable. Therefore any series of Readers should be framed on a consistent plan, revised by a single editor, guarded carefully against needless repetition, and graduated with the utmost care, so as to lead the learner safely and pleasantly into the paths which he is desired to tread. There is no sign of such pains having been taken in the present instance. These books differ in no way from many other books of extracts, some better, some worse, which have come under our notice. But the first three books of the series are not yet published, and we may discover after their perusal that we are wrong, the Delegates are right, and that this "mighty maze" is not, after all, "without a plan."

OSCAR BROWNING.

EARLY FRENCH TEXT SOCIETY.

Chansons du XV^e Siècle. Publiées d'après le manuscrit de la Bibliothèque Nationale de Paris par Gaston Paris, et accompagnées de la Musique transcrits en notation moderne par Auguste Gevaert. (Paris: Firmin-Didot et C^{ie}.) *Les Plus Anciens Monuments de la Langue Française (IX^e, X^e Siècle).* Publiés avec un commentaire philologique par Gaston Paris. Album. (Paris: Firmin-Didot et C^{ie}, 1875.) The Société des Anciens Textes Français, founded last year to do for the older language and literature of France that which the Early English Text Society is trying to accomplish for our own, has just issued to its members its first publications, the two whose titles are given above. It could hardly have selected better examples of the great and varied interest of its work, which appeals not only to the philologist and the literary enquirer, but to the historian, the poet, and the general reader. The collection of 143 late fifteenth-century songs which M. Gaston Paris has made public is of the most varied nature; all descriptions of popular poetry (by "popular" we mean "of the people") are represented in it, and all parts of France. As the editor remarks in his instructive preface, these songs, which have remained the model of all subsequent popular French poetry, present a most refreshing contrast to the affected literary poems of the same epoch, and give a lively picture of the feelings and manners of the common people, the principal part of the nation. M. Paris, aided occasionally by other versions, has generally been able to correct the mistakes of the manuscript; and, as he has given at the foot of the page explanations of obsolete allusions, forms, meanings, and words (many of which, as *acquaint*, *array*, *livery*, *riot*, are very good English), even those familiar only with the French of to-day will meet with hardly any difficulties as regards either sense or metre. Indeed, to judge from the cases which have come

under our own notice, English people who have received a good average education, in which their own language has been carefully neglected, find the earliest Modern French a good deal easier to read than the earliest Modern English, just as they find the Old French of Wace's *Roman de Brut* much less unintelligible than Layamon's translation of it into their native tongue; and any trouble they may bestow on M. Paris's volume will be amply repaid by the beauties of this little-known field of natural poetry. Nineteenth-century readers will occasionally have their propriety shocked, but they will find very little to hurt their morals; the state of society depicted is very different from our own, and the writers are evidently almost always unconscious of saying anything exceptionable. M. Paris's name is sufficient guarantee of the excellence of the editing of the text, the variants of which the critical reader will find at the end; for transcribing into modern notation the music given by the manuscript for each song, he has secured the valuable services of M. A. Gevaert. Of course there is only the air, often so simple as to remind one of a psalm-tune (especially if the reader forgets that to indicate the same *tempo* a modern writer would use notes of half the length); but the extensive collection gives a very good idea of the popular music of the time, and we are glad to hear that M. Gevaert intends to investigate its place in the history of the art. Photographic facsimiles are given of a page of text and music; paper and print are of the best, and the whole, well bound in cloth, forms a really elegant volume. The Album, destined to form part of M. Gaston Paris's critical edition of the five earliest monuments of the French language, the first of the Romanic family used in literature, contains ten admirably distinct photographic plates; most of them are fine specimens of palaeography, but their chief interest is naturally linguistic. By them every subscriber is practically placed in possession of the manuscripts of the Strassburg oaths, the poems on St. Eulalia, on the Passion, and on St. Ledger, and the fragmentary homily on Jonah—the sole and invaluable contemporary materials for the study of the first extant stage of the French language. We await with great interest M. Paris's commentary on these documents, which will doubtless throw fresh light on some of the obscure points of Old French philology. In conclusion, we have to congratulate the France of to-day on this new proof of her revival of interest in the France of the Middle Ages; a revival in which this country is specially interested. Important and attractive in themselves as are the mediæval language and literature of France, they exercised for many generations such a powerful influence on our own that no one who studies English or England can afford to neglect them. We are pleased to see several English names in the list of members of the *Société des Anciens Textes Français*, but there are comparatively so few that we may remind our readers that the subscription is 1*l.* a year (the works we have noticed are part of the issue for 1875), and that the secretary is M. Paul Meyer, 59 Rue Raynouard, Passy, Paris, who will be happy to furnish further information.

HENRY NICOL.

SCIENCE NOTES.

PHYSIOLOGY.

A SECOND fasciculus of *Studies from the Physiological Laboratory of the University of Cambridge* has been issued under the auspices of the Trinity Praelector. The papers comprised in it have all of them appeared in the *Journal of Anatomy and Physiology* or elsewhere; but it is satisfactory, for many reasons, to see them published in an independent form. The little brochure is made up of two embryological memoirs by Mr. Balfour; a paper by Mr. Langley on the action of jaborandi on the heart; an account of some investigations into the behaviour of the hearts of mollusks under

the influence of electric currents, by Dr. Michael Foster and Mr. Dew-Smith; and some notes on the effects produced by upas antiar on the frog's heart.

On the Functions of the Cerebrum.—The last number of *Pflüger's Archiv* (xiii. 1) contains an account of some very important observations on this subject by Prof. Goltz, of Strassburg. The destruction or removal of any considerable portion of the cerebral hemispheres in animals so highly organised as the dog is usually followed by death after a comparatively short interval of time; and any observations that can be made have reference only to the immediate effects produced by the injury. This initial obstacle has been successfully overcome by Goltz. He succeeded in keeping several animals alive and in good health for weeks and months after large portions of one hemisphere (in one case, an entire hemisphere) had been destroyed by allowing a stream of water to penetrate into the skull through an opening made with the trephine. It was found that most of the striking phenomena manifested by the animals immediately after the damage had been inflicted were of a temporary character only, and disappeared in the course of time. Three sets of these phenomena were investigated. Any considerable mutilation of one hemisphere (no matter in what region) was invariably followed by great impairment of tactile sensibility, of musculo-motor power, and of vision, on the opposite side of the body. The hemi-anaesthesia was found to subside rapidly, but never completely, a certain bluntness of the sense of touch being discoverable by methods of appropriate delicacy several months after the animal had completely recovered from the immediate effects of the operation. The opposite eye, at first quite blind, gradually regains its power of seeing; but its functional restoration is never absolute, and it continues to exhibit certain very singular peculiarities, for a description of which the reader is referred to the original paper. So with the motor hemiplegia; its coarser manifestations yield to time, but a residue of impairment subsists for months, and may possibly turn out to be permanent. How ought this sudden abolition of certain faculties, and their all but complete restitution, to be accounted for? The author passes the various theories advanced by Flourens, Carville and Duret, Schiff, Soltmann, Hitzig and Ferrier, under review, and finds that not one among them is capable of affording the desired explanation. A belief in the existence of localised centres in the cortical substance is alike incompatible with the fact that lesion of any part whatever of a hemisphere is followed by one and the same train of symptoms, and with the observed restoration of the particular functions over which those centres are supposed to preside. Goltz then proceeds to set up a hypothesis of his own, which he regards as adequate to cover all the phenomena. According to this, the primary effects of the cerebral lesion are due, not to paralysis, but to irritation. The centres for vision, for the perception of tactile impressions, for the co-ordination and discharge of muscular movements, are none of them situated in the greater brain, and are not, therefore, directly injured. They are temporarily inhibited, the restraining impulse being transmitted in a downward direction from the hemispheres. As the irritation caused by the injury subsides, the inhibitory influence subsides also, and the centres in question resume their functional activity. The small residue of permanent mischief remains to be accounted for; but it is by no means certain how far any of the residual phenomena deserve to be viewed as really permanent. That they last for months is no proof that they will last for years; and, until their permanence has actually been established, the author deems it superfluous to attempt to reconcile it with his theory.

Functions of the Cerebellum.—Nothnagel, in a preliminary notice (*Centralblatt für die mediz. Wissenschaft*, May 27, 1876), gives a brief out-

line of results obtained by acupuncture of the cerebellum in the rabbit. He finds that movements may be excited by puncturing various points in both cerebellar lobes and in the vermiform process. Mechanical irritation of one lobe causes motor phenomena, first on the same, then on the opposite side of the body; the same is true of unilateral irritation of the vermiform process. When the latter is irritated in the middle line, motor troubles are manifested on both sides of the body simultaneously. The greater part of one or both lobes of the cerebellum, or the entire upper and posterior part of the vermiform process, may be destroyed without giving rise to any obvious consequences. On the other hand, the removal of a particular portion of the vermiform process causes well-marked and permanent motor disturbances, identical with those originally described by Flourens.

Variations in the Electrical Condition of the Heart.—Previous observations have shown that during every revolution of the heart its muscular tissue undergoes singular variations of temperature and excitability; a diminution of excitability and a rise of temperature invariably coinciding with the systole, while the opposite phenomena are manifested during diastole. M. Marey has recently attempted to ascertain (*Comptes Rendus*, April 24, 1876) whether any corresponding variations in the electrical condition of the cardiac muscle could be made out. The galvanometer, owing to the inertia of its needle, is unsuitable for the observation of sudden changes in the intensity of currents. Hence, in M. Marey's experiments, Lippmann's electrometer was employed. The heart of a frog was placed on two non-polarisable electrodes, one of which supported the apex of the ventricle, while the auricles rested on the other. Two successive negative variations of the current were indicated by the electrometer during each cardiac systole; one of these was sudden, and corresponded with the abrupt contraction of the auricles: the other was more gradual, and coincided with the slower movement of the ventricle. The phases of electrical variation are thus seen to be similar to those of the work done by the muscle.

The Perception of Form, Light, and Colour, by the Peripheral Parts of the Retina.—The following are the principal results of an enquiry into these points by Dr. W. Dobrowsky (*Iftiger's Archiv*, xii. 9, 10). Acuity of vision (perception of form) diminishes suddenly and greatly just outside the *fovea centralis*, and more gradually between this region and the edge of the retina. The rate of diminution varies in different meridians of the same eye, and in different eyes, even when their central acuity happens to be equal. The power of the peripheral portion of the retina to distinguish form may be greatly improved by practice; and this relative improvement is more marked in proportion as the margin of the retina is approached. The state of ocular refraction does not seem to exert any influence on peripheric acuity of vision. It may be affirmed, generally, that the lessened visual acuity of the peripheral part of the retina is chiefly due to peculiarities in the anatomical structure of the retinal elements. The sensitiveness of the retina to light is not affected by anomalies of accommodation; it sinks abruptly on the yellow spot itself, just outside the *fovea centralis*. Between this region and the extreme edge of the retina the diminution progresses, but much more slowly and gradually. The sensitiveness of the peripheral zone to luminous impressions is not improved by exercise. The sole analogy which can be made out between the visual acuity of the retina and its sensitiveness to light lies in the abrupt diminution which both undergo in the immediate neighbourhood of the yellow spot. The former is much more rapidly diminished than the latter. In respect of colour, the periphery of the retina divides itself into two zones which pass gradually into each other. The inner of these zones is capable of discriminating finer shades of difference in the

intensity of colours; the outer one is decidedly less sensitive, and can only be excited by coloured light of considerable intensity. The power of perceiving colours diminishes more than one-half in immediate proximity to the yellow spot; the rate of diminution is more rapid on the outer than on the inner half of the retina. The sensitiveness of the retina to blue rays is more rapidly lessened than that for red or green light as we recede from the yellow spot. Nevertheless, as we approach the *ora serrata*, we find that the power of perceiving red rays is the first to be lost; that of perceiving green rays is the next to fail; so that at the extreme edge of the retina, only blue can still be recognised.

CHEMISTRY AND MINERALOGY.

The Action of Malt-Extract on Starch.—At a recent meeting of the Chemical Society an important paper on this subject was read by Mr. Cornelius O'Sullivan. After referring to the recent work of Musculus, the author pointed out the identity of the γ -dextrin of Bonndonneau and the fermentable non-reducing sugar of Petit, with the non-reducing part of his maltose; this latter is a simple body, 100 parts of it reducing only as much cupric oxide as sixty-five parts of dextrose; it is completely fermentable. At first sight, and until its characters are understood, the reducing power might be assumed to indicate the presence of dextrose, and it would be considered to be composed of sixty-five parts dextrose and thirty-five parts of a non-reducing fermentable sugar. That it is a simple sugar, like lactose, however, and not a mixture, has been proved beyond all doubt. Mr. O'Sullivan showed that:—I. Maltose and dextrin are the only products of the action of malt-extract on starch. A detailed account was given of the method employed in estimating these bodies, both optically and by means of the alkaline copper solution. II. Ungelatinised starch is not dissolved by malt-extract, but gelatinised starch dissolves at ordinary temperatures. III. Starch is dissolved by that body at the temperature of gelatinisation or a few degrees below. IV. All granules of the same sample of starch do not gelatinise at the same temperature. V. Very pure starch dissolves almost completely, leaving only 0.25 per cent. residue. VI. When starch is dissolved at any temperature below 63° – 64° it splits up according to the following equation:—

VII. When the temperature during solution is maintained between 63° – 64° and 68° – 70° , the reaction is explained by the equation:—

VIII. When the decomposition takes place above 68° – 70° , the following equation describes what occurs:—

The dextrin produced in all these reactions is the same in character; it gives no coloration with iodine, and is gradually converted into maltose by the action of excess of malt-extract. Long digestion converts the maltose into two dextroses having a united optical activity $[\alpha] = +67^{\circ}$. There are other points of importance in the paper which cannot be summarised with advantage.

Carbonic Oxy-sulphide.—In the current number of the *Mineralogische Mittheilungen* (Jahrgang 1876, Heft I.) C. Than describes the remarkable gas and water which issue from the thermal spring at Harkány, in the Bányász District, which was opened up in 1845 by Count Casimir Batthyány. It was in this spring that Than discovered carbonic oxy-sulphide, which he sub-

sequently prepared artificially by heating excess of sulphur in carbonic oxide at a low red heat:—

Carbonic oxide by this treatment acquires a peculiar aromatic odour, which it imparts to water when placed in contact with it. Such water gives no precipitate with solution of nitrate of silver, so long as it is acid, but a black one forms when it is rendered alkaline; after some hours' exposure to the air, it commences to emit the odour of sulphuretted hydrogen. It was in 1866 that Than's attention was drawn to the water of this spring, when he discovered to his astonishment that in spite of its containing sulphur it failed to develop a colour with solutions of silver or cadmium. Attracted by the similarity of the odour of the water to that of the gas, which he prepared artificially, he recently devoted himself, firstly, to the investigation of a means of preparing the gas in a state of purity (*Ann. der Chem.*, Suppl. Band V., 236); secondly, to a complete analysis of the mineral water and the accompanying gas. The artesian well supplying the water is driven to the depth of 120 feet, chiefly through beds of sand and clay; the water has a temperature of 62° – 6° C. It contains so much free sulphur that a substance immersed in it soon becomes covered with a deposit which, when ignited, burns with a blue flame. The gas issuing with the water burns with a pale yellow flame, some feet in height and several inches broad. In addition to the curious reaction of the water with a silver salt, already alluded to, it forms no precipitate with barium chloride, sulphurous and hyposulphurous acid appear to be absent, and it seems, therefore, that the whole of the sulphur of the water is present in the form of carbonic oxy-sulphide. If the water be filled into bottles while it is still hot it preserves its odour for some time, but by exposure in an open vessel the carbon oxy-sulphide decomposes, and the liquid soon acquires the odour of sulphuretted hydrogen:—

Among unusual inorganic constituents, the presence of which in this water have been indicated by analysis, are iodine, bromine, boracic acid, lithium, strontium, and manganese; and among organic compounds were found a considerable amount of formic acid, traces of valerianic and butyric acid, and, in addition to ammonia, a base probably of the picoline series. For the details of the analysis of the water the reader is referred to the original paper. The gas has the following composition by volume:—

Carbonic oxy-sulphide	0.46
Carbonic oxide	1.70
Hydrogen	9.71
Carbonic acid	18.24
Nitrogen	20.58
Marsh gas	49.31
	100.00

The Homeric Metal, Kymos.—It is stated in the *Iliad* that a metallic substance of a blue colour was employed in the decoration of the shield and arms of Hector, and of the palace of Aeneas. Perforated lumps of such a material were discovered by Schliemann during his excavations at Hissarlik (Troy?). They were far from abundant, and were found lying under the copper shields to which they had probably been attached. An analytical examination by Landerer (*Berg. Hüttenm. Zeitung*, xxxiv. 430) has shown them to be sulphide of copper. The art of colouring the metal was known to the copper-smiths of Corinth, who plunged the heated copper into the fountain of Peirene. It appears not impossible that this was a sulphur spring, and that the blue colour may have been given to the metal by plunging it in a heated state into the water, and converting the surface into copper sulphide.

Magnetic Native Platinum.—A specimen of native platinum from Nischne-Tagilsk in the

Urals has recently been analysed by M. Terrell (*Bull. Soc. Chim. de Paris*, xxv. 481). The amount of iron present, 8.2 per cent., which is by no means so large as that met with in other specimens from the same locality, indicates Fe Pt₃ as the formula representing the composition of the alloy. This specimen, however, is chiefly remarkable for the fact that nickel is found to accompany the iron, and to be present in an amount closely resembling that occurring in the majority of the meteoric nickel-irons. The percentage ratios of these metals alloyed with the platinum are:—

Iron = 91.6; Nickel = 8.4. Total = 100.

Copper, a metal invariably present in small quantities in meteoric iron, is an equally constant constituent of native platinum.

Melanophlogite and Aërinite.—These are two new minerals described by Von Lasaulx in the *Jahrbuch für Mineralogie*, 1876, Heft II., 175. The former occurs in very minute cubes on the sulphur deposits of Girgenti, in Sicily, associated with coelestine, calcite, and quartz, the little cubes lying on the thin pellicle of quartz which generally encrusts the sulphur crystals. The mineral possesses the curious property, when heated, of becoming in turn yellow, green, blue, and black. According to Bettendorff's analysis it is a hydrated silicic acid; he found in it 86.5 per cent. silica, water, and very small traces of iron oxide, lime, and strontia. The second mineral, the locality of which has not been clearly defined (it probably came from Spain), is of a beautiful celestial blue colour, compact, in places somewhat scaly, and exhibits dichroism. It has a hardness between 2 and 3, a specific gravity of 2.4, and is a silicate of protoxide and peroxide of iron. This interesting specimen takes its name from its fine colour.

Hydrate of Hydrochloric Acid.—I. Pierre and E. Puchot describe (*Comptes Rendus*, lxxii., 45) a crystalline hydrate of this acid, which they have obtained by cooling the commercial acid to -21° or -22° C., and passing a current of dry hydrochloric acid gas through the liquid. The temperature rises to -18° as the point of saturation is reached, when an abundant deposit of crystals takes place, and the temperature remains constant at -18° . The crystals, which are not very stable, possess the composition indicated by the formula $\text{HCl}, 2\text{H}_2\text{O}$.

The Silicium of Plants.—We pointed out some time since (ACADEMY, iii. 357) the analogy in respect to chemical character which exists between carbon and silicium, and to the high probability that a portion at least of the silica found in the ash of a plant may be due to the combination of organic compounds containing silicium. Ladenburg's search for a silicium-cellulose, or an allied body, although incomplete, favoured this view. We find, however, that Prof. Wilson, of the Medical Department of Washington University, Baltimore, has solved the very difficult question as to the manner in which silicium is taken up. He makes the astonishing announcement (*American Journal of Science*, May, 1876) that "free silica is the only condition in which it [i.e. silica] can enter the plant." He has examined the stalk of wheat grown on the infusorial earth of Chesapeake Bay, and finds its silicious portion to consist wholly of the silicious shields of Diatomaceæ. This function, it appears, however, is not extended to the "outer husk" of every diatom: two forms, the names of which should be put on record, *Actinocyclus Ehrenbergii* and *Actinocyclus undulatus*, were absent. "They, and there probably may be other forms, are too large to enter the root capillaries."

PHILOLOGY.

PROF. J. E. B. MAYOR has published, under the title of *Bibliographical Clue to Latin Literature*, a very full and serviceable handbook of informa-

tion. It is based upon E. Hübner's *Grundriss zu Vorlesungen über die Römische Literaturgeschichte*, a little work intended as a handbook of bibliographical reference for the use of students attending the author's lectures on Roman Literature. Mr. Mayor has adopted Hübner's arrangement, but has added enormously to his store of references; notably in the case of the article on Cicero, which he has entirely re-written on a much larger scale. The preface is the genial and interesting talk of a devoted student absorbed in his study and complaining of the present dull days in which "the free and open range of reading, where the learner follows mainly his native bent and powers, has lost its charms" for our University students.

In the *Zeitschrift für Oesterreichischen Gymnasien*, 1876, part 2, Julius Jung continues his interesting essay "Die Anfänge der Romänen." The following number contains a communication by P. Knöll upon some hitherto unpublished fables of Babrius contained in the Bodleian MS. No. 2906. G. Hofmann writes on the eclipse of the sun connected by Diodorus and Plutarch with the death of Pelopidas. J. N. Ott has notes on Placidus and Isidore. The most important articles in the next number are by A. Göbel on *Ποσειδάων γαιόχρος ἐνυφρύγαιος* (which the writer explains as meaning the cloud-god who "traverses and waters the earth"), and by W. Förster on a fragment of a Paris MS. of Juvenal, attributed to the ninth century, and harmonising closely with the *Pith-oceanus*.

The *Zeitschrift für Deutsche Philologie* (vol. vii., part 1) contains a long and very important essay by Rieger on the early Saxon and Anglo-Saxon metres. The late Moritz Haupt's critical observations upon Ruprecht von Wirzburg's story, "Zwei Kaufleute," are published here for the first time by W. Wilmanns. At the end of the volume there is an interesting notice of the late Dr. Heinrich Rückert, Professor of the German Language and Literature at Breslau, and an important review by Gering of Bernhardt's *Uffilas*.

In the *Hermes* (vol. xi., part 1) the most important article is by Kirchhoff, on the first ten years of the Delian confederacy. The writer places in a new light several details of a very difficult period. Th. Mommsen discusses the lists of the Italian armaments of 225 B.C. given (directly or indirectly from Fabius Pictor) by Polybius and others, and maintains the general trustworthiness of Polybius on the point. Otto Seeck has a paper on the date of Vegetius, whom (with Gibbon) he assigns to the reign of Valentinian III. E. Zeller has an interesting essay on the relation of the writings of Plato and Aristotle to their teaching. M. Schanz contributes an important communication on the MSS. of Plato, and C. Robert discusses an inscription from Tanagra, copied by himself in June, 1875.

The second part of the *Archiv für slavische Philologie* (see ACADEMY for April 22, 1876) contains a valuable article by Prof. Leskien, ninety pages long, on the Wendish version of the New Testament made by "Miklawusch Jakubica" in 1548, and preserved in MS. in the Royal Library at Berlin. Prof. Nehring contributes a detailed account of what has been written of late years by Polish philologists. Of great interest to comparers of popular tales will be found Prof. Jagić's translation of fifteen Serbian folk-tales published by J. B. Vojinović at Belgrade in 1869, to which Dr. Reinhold Köhler has appended most valuable notes. Prof. Jagić also contributes an exhaustive essay on "Dunav-Dunaj (the Danube) in Slavonic Popular Poetry," the various forms of the name of that river being treated philologically by Prof. K. Müllenhoff in a separate article, entitled "Donau, Dunav, Dunaj." The third part will complete the first volume of the *Archiv*. It will contain, among other things, a bibliographical survey of what has been done in the field of Slavonic philology during the last five years.

FINE ART.

Lapidarium Septentrionale: or, a Description of the Monuments of Roman Rule in the North of England. Published by the Society of Antiquaries of Newcastle-upon-Tyne. Folio. (Newcastle-upon-Tyne, 1870-5. London: B. Quaritch.)

THE completion of this important work, which, to say nothing of its earlier preparation, has been for five years in the press, is a matter for sincere congratulation. Although emanating from a local society, this is really a book of national importance, and by bringing out this collection of inscriptions the Newcastle antiquaries, with Dr. Bruce at their head, have done honour to their country. If the Society had thought fit to confine this volume to a description of the very remarkable series of sculptured stones within their own museum, no one could have had any right to complain; but the Council, animated with a more generous spirit, took a wider sweep, and have given us in this goodly tome a grand series of descriptive illustrations of the contents of the stations in four of the northern counties, bearing as they do upon the history of that vast monument of Roman power, the great barrier which can still be traced from sea to sea. It has been often said to our reproach that Englishmen are unable to classify their national antiquities with the skill of men like Orelli, Henzen, Hübner, Stephens, and others. The *Lapidarium Septentrionale*, following close upon the *Sculptured Stones of Scotland*, by Dr. Stuart, shows that the spirit of Horsley is not yet extinct. And it is gratifying to observe that Dr. Bruce in his admirable work has been able to rely at all times upon the friendly and intelligent aid of such foreign scholars as Hübner and McCaul, who have shown themselves to be masters in epigraphy.

The five parts, or fasciculi, of the *Lapidarium* make up a volume of more than 500 pages. The size is small folio, the most convenient perhaps that could be chosen, especially for illustrations. We have delineations of nearly a thousand objects. Wherever an inscribed stone can be found, it is engraved either in outline or with shading; where it is lost the letters are given as recorded by others, with explanations of the inscriptions and references to the works and opinions of previous epigraphers and antiquaries. It would have been better certainly if all the engravings had been executed in the same style, and nearly on the same scale. We see that Dr. Bruce has often used the illustrations in his *Roman Wall*, and in the Catalogue of the Newcastle Museum. The cost of re-engraving has no doubt necessitated this, and, although we are sorry that it should be so, we are too grateful to Dr. Bruce to find fault with him. If all the monuments which he commemorates were to disappear, we have in this volume an enduring record of them. Of course everyone is aware that there are many of which the reading must always be doubtful, and of which even the skill of an engraver can afford no certain representation.

In A.D. 79 or 80 Agricola carried the Roman arms as far as the Frith of Forth, but between that time and the year 108 wo

do not possess a single inscription to tell us what was going on in the north. For the last-mentioned year there is a tablet at York which shows that the soldiers of the ninth legion, at Trajan's order, erected some important building, probably one of the city gates, or some portion of the fortifications. This proves, in Dr. Hübner's opinion, that York was then the capital of Britain. It was probably the chief city in the north from the time of Agricola's visit. How many stations there were at that time in the north it is impossible to say; at all events there was no Roman wall running across the island; and on that account, as the country was open to invaders, it is impossible to suppose that the fine tessellated pavements of Isurium (Aldbrough) were then in existence. They imply security and ease, and were probably made for the Roman officers in the legions at York after the country was safe; who found in the beautiful scenery of Swaledale, and in hunting the deer and the boar in its woods, an agreeable change from barrack-life in Eboracum. In A.D. 119, in consequence of an insurrection in the north, Hadrian brought the sixth legion with him to York. It has been thought that the ninth legion, which disappears from history, had been destroyed in Scotland; but the great number of tiles in York bearing its later stamp (ix. instead of viiii., the latter being used in A.D. 108) seem to contradict this opinion. Hadrian made York the headquarters of the legion which accompanied him, and the basis of his operations; thence he proceeded northwards, clearing the country of his enemies, and, to exclude them from the country on this side of the Tyne, he projected and carried into execution the famous barrier or wall which ran across the island from Tynemouth to the Solway. It must have been certainly twenty feet in height, and of a considerable thickness. A little to the south of this *murus* there was a *vallum* protected by ramparts and a ditch, and between this and the wall ran a military road which would be of the greatest value. The wall was protected by a series of mile-castles and fortified camps, in connexion with a number of subsidiary towns on the roads to the east, west, and south, to bring the troops into easy connexion with the military centre and the sea. One fleet guarded the Solway and the Irish Sea at the western extremity of the wall. The eastern end, at the mouth of the Tyne, would no doubt be similarly protected. The building of the wall was probably executed by the unhappy natives, the legionaries with the auxiliary troops cultivating and protecting the country, and urging on and directing the unwilling workers. Even when the lofty barrier with its outworks was finished, the soldiers must have lived in almost perpetual uneasiness. Marauding bands, bush-rangers we may call them, must have been often prowling about, the genuine ancestors of the Border reivers, and occasionally there were very serious assaults, in which the Romans were driven off and their camps and fortifications destroyed. From the time of the first invasion of the Brigantes to the cession of Britain by the Romans, the position of a place like Eboracum as a rallying point and dépôt was a necessity. The

Romans held Britain by force of arms from first to last. As the southern districts became pacified and subdued, the tide of war rolled into the north, and as that district was always dangerous or in arms, Eboracum, which is exactly in the centre of the island, became and continued to be the military capital of the country.

Hadrian's chief officers in constructing and defending the wall were Aulus Platorius Nepos and M. Maenius Agrippa. The memory of the former is preserved by a series of inscriptions in Northumberland. He survived the perils of his command, and lies at Aquileia in Italy, under a stately monument, designated thereon as legate of Augustus, and *propraetor* of the province of Britain. M. Agrippa was a sailor, great in his reverence for the gods, and keeping his fleet at Maryport, in Cumberland. He, too, died at home at last in his own beautiful Italy. The second and the sixth legions had the principal charge of the construction of the wall, assisted by a number of foreign auxiliaries. Dr. Bruce has a map to show the nationality of these assistants. They were chiefly drawn from France, Spain, and the Low Countries. How wise it was to remove such dangerous subjects from their homes! We find Britons fighting for the lords of the world in Dacia and Pannonia, while Spaniards and Germans were under arms in England. We cannot believe that they were ever thoroughly domesticated. A great proportion of the monumental inscriptions in the north reveal the early age at which these foreigners died, slain not only by hardship, but by the climate to which they had never become inured. Such altars as those dedicated to *Fortuna Redux*, and the *Matres Transmarinae*, disclose their longing for home.

The fortified towns on the Roman wall which Dr. Bruce's volume illustrates are, in some cases, recognised with difficulty. Mounds of earth and marks of castrametation reveal their existence. In other cases the sites are lost. When Camden visited the north, and long after his day, walls were visible, and fragments of buildings and sculptured stones in profusion. The rapacity of modern times has gradually destroyed these remnants, and the churches, farm-houses, and fences in the neighbourhood betray their origin. In some of these towns there must have been public buildings of considerable importance, but seldom, of course, very highly ornamented. The workmanship of many of the altars and larger inscriptions may be favourably compared with that of any which have been found in the south. Still there are no evidences of luxury on the line of the wall, no villas or tessellated pavements, no rich personal ornaments or beautiful pottery. A few silver vessels have been picked up, but they are only waifs and strays. It is to be expected that in barrack life in the neighbourhood of the enemy everything would be plain. The majority of the soldiers would have little of their own, and their officers would wisely leave their valuables behind them when they started for the north.

The history of the Roman stations, their builders and inmates, can only be found in the inscriptions which they left behind.

These, although frequently injured, are in a better condition, as a general rule, than what we find in the towns in the south. And they are more numerous as well. More inscriptions have been found in a single camp on the wall than have been discovered in London and York together. In great cities like these there has been a continuous occupation; the building materials have been used over and over again; and if sculptured stones are discovered we find them at a great depth, and disfigured, unfortunately, by Christian intolerance. The great inscription to Trajan at York was found in fragments nearly thirty feet below the level of the present city. But it was otherwise in the north. On the bleak hills of Northumberland and Cumberland no one cared to succeed the Romans in their habitations. The sculptured stone is discovered at but a slight depth, and often as it was left. What numbers of these memorials there must have been! The soldiers had plenty of leisure at times; they had quarries on every side; and they were an inscription-loving race. No work seems to have been finished without some tablet to commemorate it. Every public building, temple, bridge, mile-castle, or whatever it was, had its history on stone. The *centuria* which completed a few hundred feet of the wall signalled its work before it passed on to another. And so, in the absence of chronicler and chronicle, we turn for the history of Britain to the humbler and more enduring records of the Roman soldiery.

The illustrations of domestic life in this volume are few. We should have known more of it if a single cemetery had been explored, but monumental inscriptions are scarce, and of less interest than the rest. They tell us, however, that the soldiers had their wives and children with them during their sojourn in the north. No doubt a great part of the district was systematically occupied by the Romans and their allies. The country must have been studded with farms, while the inner wealth of the earth, iron, lead, and coal, was regularly worked. Jupiter Dolichenus was the miner's god. Hunting must have been a favourite and a necessary pursuit. In one instance, the *venatores* of Banna set up a pretty little altar to their patron Silvanus. In another, a successful sportsman in a happy mood of victory raised an altar to the same deity, *ob aprum eximiae formae captum quem multi antecessores ejus praelari non potuerunt*. At Housesteads there is the figure of a stag placidly regarding a net which is meant to secure him. In vain is the net spread, &c.

A great part of the inscriptions are upon altars to various deities, and these amount to above three hundred in number. There are more than eighty to Jupiter alone, and all the *Dii Majores* are commemorated save Vesta, Ceres, and Venus. The Mother-goddesses, the Nymphs, the Genii in their various capacities, and Fortune, have numerous votaries. We have memorials also of local divinities whose worship had become incorporated in the religion of the soldiery, such as Anociticus or Antenociticus, Belatucader, Cocidius, and others. There is also a deity called *Veteres*, or *Vetus*, perhaps the ancient god, embracing in one general name the Pantheon of the earlier Romans, forgotten

among the novel inventions of their children. At Housesteads and Rutchester we have strong evidence of the popularity of the Mithraic worship. At Carvoran we find several altars to the Syrian goddess, whoever she might be. She is probably identical with Astarte, who is honoured in Greek verse at Corbridge. A solitary inscription to Serapis has been found in Westmorland. We learn from the last-mentioned altars that the religions of the East had been brought under the lower empire into the West. There is not a single memorial of Christianity to be found on stone.

We have no time to go into minutiae, still we would suggest to Dr. Bruce whether the *felix ala Asturum* of No. 943 does not illustrate, and perhaps explain, the lost inscription No. 27. We may also compare the three inscriptions to the genius of the *praetorium* with the bronze tablet in the York Museum, which has a Greek dedication to the gods who presided over the same place. These inscriptions, as Mr. Kenrick justly observes, explain the unwillingness of the Jews, as recorded in St. John xviii., 28, to go into the judgment hall at our Lord's condemnation. The presence of these heathen memorials in it made them keep away "lest they should be defiled." We may observe with regard to No. 662, that it is almost identical with a stone said by Mr. Ingledew, in the Appendix to his *History of Northallerton*, to have been found in cutting through the Castle Hills near that town in 1838. This inscription is not mentioned by Dr. Hübner.

We observe with some regret the number of places in which the sculptured stones recorded in this volume are deposited. We can express no better wish in the cause of historical enquiry than that there should be two or three repositories only in which these curiosities should be stored. Dr. Bruce well observes that whenever an altar gets into private hands, sooner or later it is sure to be lost. Everything found in Northumberland ought to be under the charge of the Society of Antiquaries at Newcastle. But that useful and now ancient association ought not to seek this responsibility until a domicile is provided, much larger and better lighted than the gloomy castle in which their treasures are at present entombed.

We will make another suggestion. Dr. Bruce gives representations of 943 inscribed or richly-sculptured stones in his book. Dr. Hübner can only muster about 1,200 for the whole of Britain. Let us have the remainder engraved and described to range with the volume before us. The Yorkshire Philosophical Society have been meditating a work of this kind to cover the whole of that great county, with its sculptured stones, tessellated pavements, pottery, and objects of military and domestic use. If the two Antiquarian Societies at London and Edinburgh will do the same for the southern counties and Scotland, we shall then possess a *Theatrum Romanum* of inestimable value. The Antiquarian Society at Newcastle has set them an example which they should be quick to follow.

JAMES RAINE.

THE CASA BUONARROTI IN FLORENCE.

A LEADING Roman Catholic Journal thus describes this interesting mansion:—

"The present writer has several times visited the house purchased by Michelangelo in the Via Ghibellini, Florence, and once in company with Prof. Orioli, and Mrs. Trollope the novelist, and mother of two novelist sons. The interest excited in all the party was extreme, for several rooms in the house once inhabited by the great painter, sculptor, architect, and poet, were kept in precisely the same state in which he left them on the day of his death."

This writer evidently believes that Michelangelo lived in the house in the Via Ghibellini, and apparently that he died there. On August 18, 1549, writing from Rome to his nephew Lionardo, he says, "This day fifteen days I answered thee about the house in Via Ghibellini that thou shouldst arrange as might seem best to thee." Michelangelo had a preference from party considerations for a house for his nephew in the Ghibelline quarter; it was not, however, purchased till afterwards, for on November 5, 1552, he again writes to his nephew, "I should be glad to hear that thou hast an opportunity to purchase a house for a thousand or even two thousand crowns." The house in the Via Ghibellini was finally secured for the nephew, but Michelangelo never lived in it, for he never was in Florence afterwards, and died in Rome. The house purchased for the nephew was subsequently fitted up as it is now seen by his son Michelangelo the younger in 1620, fifty-six years after the death of his grand-uncle, at a cost of twenty-two thousand crowns, the architect employed being Pietro da Cortona. No less than twenty-four of the best artists then resident in Florence were employed to paint the pictures in oil which decorate the walls and ceiling of the principal room or gallery, the subjects of these being events, or supposed events, in the life of Michelangelo, or allegorical figures allusive to his talents and virtues. One represents his funeral in San Lorenzo, with the famous catafalque erected on that occasion. The truth of the representation, however, cannot be depended upon, and these pictures, painted within sixty years of the death of the great Master, are undoubtedly misleading as to the facts of his life. They are good examples of the then state of the Tuscan school, but in them all it is evident how completely the precepts and style of Michelangelo had ceased to influence it, and they, as well as all the pictures and decorations in the house, show at a glance the erroneous nature of the statement that "several rooms" in it "were kept in precisely the same state in which he left them on the day of his death." The other rooms were fitted up at the same time, under the same architect, and were painted in fresco by artists of inferior reputation, with a dash about them of the manner of Giovanni da San Giovanni, but without his cleverness. They contain, in the same apocryphal spirit as the pictures of the gallery, portraits of Ludovico, the father of Michelangelo, of his mother, some of his brothers, and numerous groups of the greatest Italians who have illustrated Italian literature, science, and art. The spirit in which they are conceived is so good that it is to be lamented that the art is not better. The part of the mansion shown is only the *piano nobile*. There are, besides, a ground-floor and upper story, but these do not help the statement made, and never were occupied by Michelangelo.

In the room immediately beyond the gallery is the shallow press, with three doors, in which the late Signora Rosina Buonarroti found nineteen models in composition, or terra-cotta, which are now shown in another room in glazed cabinets. It is almost incomprehensible how it was so long before the press was opened; true, the key-hole is covered by a piece of ornament which moves on a pivot, but the hinges stick out, and a more obvious press could hardly exist anywhere, while there is a similar one on the other side of the room. As the press is at present shelved the two largest

models could not stand in it, but the shelves are moveable. Two of these models are apparently sketches for the *David*, although they differ from it in action. One, with its pedestal, is two feet two and a half inches high; the other, with its plinth, is twenty-one and a half inches. The rest of the models are figures, or fragments of figures, and two are groups, one of them being an imitation of the Greek marble *Ajax with the body of Patroclus*. There is also a fragment of a crucifix carved in wood, spoken of as an early work, but from its decided manner that is improbable; its entire nudity is also inconsistent with the idea of its having been sculptured in the youth of Michelangelo. The expression of death in agony, not only in the body drawn up in the act of expiring, but in the limbs stiffened with pain, is rendered with terrible truthfulness. This model is ten and a half inches high, and is marked all over with the grooves of the gouge used in carving it, which cross the grain of the wood and the lines of the muscles.

The Casa Buonarroti having fallen into disrepair, the Municipality determined that it should be put in a good state before the celebration of the festival. It was proposed to cover the façade with *sgraffiti* in the old Florentine way, and excellent designs were made by the eminent artists Barabino, Vineia, and Conti; they were not, however, executed, but a bronze bust of Michelangelo, cast and presented by the late eminent bronzist Signor Papi, was placed in a niche over the door, and a sculptured heraldic shield—that of Buonarroti Buonarroti, Count Palatine, the younger brother of Michelangelo (therefore the arms of his descendants)—was erected at the angle of the mansion. This shield of arms is frequently engraved as that of Michelangelo, from which it differs in essential particulars.

No alterations were made within the apartment which is shown, but the marvellous alto-rilievo in marble of the *Battle of Hercules and the Centaurs*, executed when Michelangelo was fifteen years old, was removed from a very bad to a good light, and can now be favourably seen. The collection of drawings is also admirably arranged in one of the rooms in glazed cases. Besides all these works of art there are some fragments of Etruscan and Greek sculpture, some pictures, a few specimens of the school of Luca della Robbia, the basso-rilievo in the style of Donatello (one of the earliest works of Michelangelo), a *Descent from the Cross* evidently not by him, and a model in wax of the *Pietà* in the cathedral, supposed to be the original sketch, and which is for sale. There is also a large picture profanely attributed to the great master, seeing how bad it is. There are four portraits—one a statue by Antonio Novelli, a bronze bust said to be by Giovanni di Bologna, a well-painted head by Marcello Venusti, and one of inferior merit in a white turban, ascribed to Giuliano Buggiardini. The collection contains also a portrait of Michelangelo the younger, by Christoforo Allori, and a bust of him by Giulio Finelli of Carrara. There are busts of the Cavalier Cosimo Buonarroti and of his wife Rosina, who did so much for the memorials of Michelangelo by her devoted care. It is specially provided in the will of Cosimo Buonarroti that no document in the Archives should be published, and no work of art by Michelangelo should be copied. Both provisions have been broken through, with what results it remains to be seen, but they were singularly narrow-minded and certain some day to be set aside.

It is very desirable that a descriptive catalogue of the collection of drawings by Michelangelo should be published. They throw much light upon his studies and career, and illustrate his ideas of various branches of art and practice. There are about one hundred and eleven sheets of architectural designs and sketches of various details. Fifteen are ground-plans of private and public buildings, thirty-four are compositions, twenty-seven contain at least one hundred free-hand

sketches of capitals, bases, entablatures, and mouldings of the orders, among which, strange to say, is a drawing of a Grecian Doric order. He must have been familiar with that in the Church of San Pietro in Vincola, but this outline does not recall it; he probably imitated a sketch by some artist who had visited the remains of this order elsewhere, or else this is taken from a monument which may have then existed in Rome but has now disappeared. Several of the sketches are obviously for the guidance of quarrymen: they are free-hand drawings with the measurements marked upon them by his own hand. About ninety of the studies in this collection are free-hand: only thirty-one have been executed with the aid of instruments; to one only is there a scale. All this accords with Michelangelo's practice of architecture, which was that of a painter rather than of a trained architect. The designs are eccentric; the proportions are not beautiful or harmonious; the collection illustrates his own statement, frequently repeated by him, that "architecture was not his profession." Yet it shows, that when compelled to act as an architect, he took pains to acquire a knowledge of details. One drawing of this set is a study of a pavement and of two houses drawn in parallel perspective. The point of sight is fixed, the retreating lines are converged in it, but he does not appear to have understood the use of points of distance; the drawing is partly geometrical, partly free-hand, and the free-hand parts are out of perspective, as are three figures which he has introduced. This is not, as might be supposed, an early work, for it is drawn with a reed pen and bistre over a drawing in chalk of a figure evidently of his advanced style. This solitary study is, indeed, profoundly interesting and suggestive; so far as its evidence is of value, it shows a very elementary and imperfect knowledge of scientific perspective, even when his masterly powers of drawing the human figure were mature.

There are eighteen drawings of fortifications. These are, for the most part, rudely sketched; there is not a trace about them of the applied geometry which is the basis of all good military drawing. There are strange, eccentric forms, affording evidence of the observation of existing military works, but the observation seems that of an amateur rather than of a trained engineer. All the drawings are plans: there is not one profile; and there is much evidence of waste of wall and material. The lines of fire are marked with red chalk, and were evidently considered with care, although some of them are directed from a very short distance against the city walls in the rear of the proposed works. These drawings do not suggest that at the time when they were executed Michelangelo was a skilful military engineer, although apparently they belong to the epoch of the defence of Florence.

There are at least seventy-four sheets of drawings of the human figure, in which Michelangelo comes out in all his strength and greatness. There is one, especially, of a *Madonna and Child*, executed in black, red, and white chalk, which certainly is one of the finest drawings in the world. There is a very interesting sketch for the *Last Judgment*, differing essentially in composition from the fresco painted in the Sistine. There are in the collection fifteen drawings of heads, thirteen of legs, eleven of arms, five are anatomical studies, two are of drapery, and five of a horse. About fifty are sketches, small and large, of groups and figures in various attitudes. As showing Michelangelo's methods of design and study this collection is invaluable.

On one of the architectural drawings, containing studies in red chalk of the base of a column, there is written by the hand of Michelangelo the following interesting document. As it has only lately been exhibited, there is no reason to think that it has yet been published, at any rate beyond the borders of Italy. As it would not be possible to print it with its abbreviations and orthographic-

cal peculiarities except by means of facsimile, it is rendered in modern Italian:—

"E il di e la notte parlono e dicono noi abbiamo col nostro veloce corso condotto alla morte il Duca Giuliano e ben giusto che egli ne faccia vendetta e la vendetta è questa che avendo noi morto lui lui così morto ha tolto la luce a noi e con gli occhi chiusi ha serrato i nostri che non risplendono più sopra la terra che avrebbe di noi dunque fatto mentre vivea."

There is not a point anywhere to divide the parts of this long sentence. It evidently alludes to the monument of Giuliano de' Medici in the Medici Chapel, and at first sight it appears not only to upset all existing theories of the meaning of the monument, but the first impression received from the lines is a painful one. Probably they will be differently regarded and explained by different minds. In the first place they establish beyond controversy, under the hand of Michelangelo, that the monument with the figures of Day and Night is that of Giuliano, and not of Lorenzo, as surmised by an eminent writer. If the discovery of the bodies of Lorenzo and Alessandro il Moro in the sarcophagus of the other monument does not satisfy every one of its meaning and dedication, this description by Michelangelo himself removes all room for question. The lines, to my mind, establish beyond doubt that the idea of the monument—therefore that of the other also—must no longer be attributed to Michelangelo, but that the subjects which he was to carve in marble were prescribed—probably by Leo X.—when the order for the monuments was given. These fierce, extravagant lines were written by him in scornful derision of the adulation which the theme implied, and this is shown, not only by the tone of caricature, but by the last line, "che avrebbe di noi dunque fatto mentre vivea." The lines may be a sketch for a contemplated sonnet, never written. So little relation has their extravagance of diction to the real sentiment of the monument as it exists that writers on Michelangelo may still continue to speculate on his true purpose in the design, which shows how vain were the attempts made by his powerful employers to fetter his genius or to bind it to the realisation of their fancies. They prove—if I am right in my estimate of them—that the subjects of the monuments were dictated to him, as, as I have pointed out elsewhere, must have been the case when Julius II. commissioned his monument, which was to contain allusions to political events of which Michelangelo knew nothing, and to victories existing only in the Pope's imagination.

CHARLES HEATH WILSON.

P.S. Having consulted my friend the Cavaliere Gaetano Milanese as to his view of the real object of these lines written by the hand of Michelangelo, he informed me that he had shown them to the eminent sculptor Prof. Dupré, who had printed them in his *Michelangiolo Buonarroti: Ricordo al Popolo Italiano*. Signor Dupré does not attempt to assign a meaning to them, he only alludes to the explanations of the ideas which pervade the two tombs given by eminent Italian writers. To me it appears that these more or less suggest sycophancy on the part of Michelangelo, and, believing him incapable of this, I have elsewhere given a different view of his real purpose. These precious lines, written by himself, indicate his opinion of the themes prescribed; while his treatment of the monuments shows how he changed the sycophantic thoughts forced upon him into something very different from what was intended, and gave them a meaning consistent with truth and with patriotism.

NOTES AND NEWS.

THE Reviews this month contain several articles devoted to the discussion of art. In the *Fortnightly*, besides the "Reflections at the Royal Academy," by Mr. Statham, we have Mr. Frederic Harrison's letter to Mr. Ruskin, in which the subject of art naturally assumes considerable

prominence. The younger writer expresses brightly and forcibly enough his own trust and belief in the present age, but his arguments do not always show a very delicate appreciation of Mr. Ruskin's attitude. Mr. Harrison has the courage of his opinions, and does not shirk the task of enforcing his views by illustration. As might be expected, however, the statement rather tends to throw into sharper relief the antagonism of the combatants, and is by no means calculated to bring them into nearer agreement. Each fresh illustration, put forward with entire belief in its sufficiency, seems only to widen the breach between them, and to render reconciliation the more hopeless. Possibly reconciliation was no part of Mr. Harrison's purpose. His special force is that of a combatant, and for effective combat in literature some failure of sympathy is almost indispensable. Mr. Statham's criticism of the Academy is a pleasant expression of views widely held. Save for an emphatic but not very conclusive footnote, anent what the writer describes as the modern "tattle" about decorative art, it contains little that is new. Mr. Poynter's picture is preferred to Mr. Leighton's, but the reasons given for the preference are not very searching. The explanations of Mr. Armitage's failure in his picture of *Phryne* are still less satisfactory, and the praise of Mr. Tadema's *After the Dance* is not very strongly supported. There are some sentences in regard to certain pictures by Royal Academicians that may possibly be useful as giving frank utterance to a very general feeling, while among the more laudatory passages of the review the description of the sea-painting of Mr. Henry Moore is noticeable.

THE committee formed to secure for the Wellington monument the completeness of the original design is about to issue a small pamphlet containing a short account of Stevens's career. It is hoped that by this means sufficient public interest may be aroused to ensure the acquisition by the nation of the equestrian model which the sculptor left almost complete in his studio. If it is too late to add the bronze figure to the monument, it may at least be possible to purchase the plaster model for one of the national museums.

THE Royal Academy has permitted Mr. Alfred Marks to have a large photograph taken from the cartoon by Lionardo da Vinci in Burlington House. How soon the cartoon itself will be made accessible to the public it is hard to say, but as the gallery in which it is placed has long been finished, and the various artistic treasures belonging to the Academy duly arranged, it cannot be many years before the public is admitted. Very many of us may live to see not only this magnificent possession, but the Gibson models and the Diploma pictures exposed to view. In the meantime those who are interested in this particular design by Da Vinci will do well to examine the small first sketch of the composition in the British Museum; and, pending the publication of the photograph from the original, some slight idea of its beauty may be gained from the large engraving by Anker Smith, the only engraving of the cartoon in existence.

WE have received a pamphlet on *English Landscape Art; its Position and Prospects*, by Alfred Dawson, F.R.A.S. Mr. Dawson dwells with emphasis upon what he conceives to be the retrograde character of modern English landscape-painting. Its failure he attributes to three leading causes:—1. An unnatural and insecure constitution in our great Art Society, the Royal Academy; 2. the inferior quality of English art-criticism, which he describes as consisting in great part of "broadcast compliments, no doubt very pleasant to all parties concerned, but not at all likely to yield that truth on which artistic progress must depend;" 3. the introduction of various strange styles of painting and of taste, at the head of which Mr. Dawson ranks the pre-Raphaelite movement. The essay is not well arranged, nor

is it written with any particular grace or force of style, but it contains a number of facts that will be of interest to landscape-painters.

In the Athenian newspaper *Ἦρα*, under dates May 28 and June 8, 9, will be found a report of some recent discoveries made at Athens in the course of the excavations which the Archaeological Society there are now making on the south side of the Akropolis. On clearing away the more recent *débris* at its foot they have found upwards of thirty fragments of inscriptions, among which are some fragments of treasure-lists, and other documents of the most flourishing period of Athens. Between the Roman theatre of Regilla and the cave where once stood the Choragic monument of Thrasyllos, exactly under the south-west angle of the Parthenon, has been found a votive relief, representing two figures, one of whom reclines on a couch; below is the word *ΑΣΚΛΗΠΙΩΙ*, showing that the sculpture is a dedication to Asklepios. The indications which Pausanias gives as to the temple of Asklepios at Athens show that its site would not have been far from the spot where this dedication to the God of Medicine was found. On another fragment was the name of the Archon Euthias, associated with that of the tribe Demetrias. The date of his archonship falls between B.C. 296 and B.C. 287. Another relief is inscribed with a dedication to Herakles.

At a General Assembly of the Royal Academy of Arts, held on Thursday evening, June 29, Mr. Edward J. Poynter, Sir John Gilbert, and Mr. George D. Leslie were elected Royal Academicians.

THE new French postage-stamps are now in circulation. They represent Commerce with the caduceus and Peace with the olive-branch joining hands over a terrestrial globe, upon which is placed a number indicating the value of the stamp. The design is by M. Jules-Auguste Sage.

THE *New York Herald* announces that in the region of Fresno, California, hieroglyphics have been discovered of an interesting archaeological character, inscribed upon the rocks and in perfect preservation, resembling those of the Aztecs, which would lead to the supposition that they had settled at Fresno before the construction of the famous Casas-Grandes in Anahuaco.

THE Société Internationale des Aquafortistes will open an exhibition of etchings on the 9th of this month in the rooms of the Cercle Artistique et Littéraire at Brussels. It will be divided into two sections: the first containing works dating from the beginning of the century; and the second, works executed since 1830.

THE *Chronique*, without giving too much credence to the statement, records the discovery of a *Madonna and Child*, painted by Giotto, beneath the whitewash of an old house at Villeneuve-lès-Avignon.

THE medal which the Institute of British Architects has recently awarded to M. Viollet-le-Duc has only twice before been given to French architects—namely, to M. Hittorff and M. Lesueur.

At the Congress of French Architects, held last month at the Ecole des Beaux-Arts, the medals of honour were awarded to M. Paul Sédille, of Paris; M. Belle, of Paris; and M. Duphot, of Bordeaux.

It may be worth mentioning, *à propos* of the appearance of the Catalogue of the Greek Coins of Sicily, that the coins there described are in course of exhibition in the Gem Room of the British Museum; the first part extending from Abacaenum to Segesta, the second part to consist chiefly of the coinage of Syracuse. This is probably the finest collection ever formed of this splendid series, which is almost the only record of a special highly-marked branch of Greek art.

MR. JOHN HOUGHTON HAGUE, a rising member of the "Manchester School," is engaged upon a

picture entitled *The Chimney Corner*. It represents with much character and fidelity a group of old cronies enjoying themselves in the chimney corner of a country inn. The drawing in black and white is intended as a design for Mr. Edwin Waugh's forthcoming book, *The Chimney Corner*, and the oil painting is a commission from Mr. John Evans.

On the 27th ult., Messrs. Christie, Manson and Woods sold the valuable collection of the late Mr. Romaine Callender, of Mauldeth Hall, Lancashire, well known for the superb specimens it contained. Among the foreign porcelain, an Angoulême vase, richly gilt, and painted with subject in sepia, 155 gs.; Capo di Monte ewer, formed as a shell supported by sea horses, 24l. 10s.; Berlin plate, with classical subjects, 15l. 10s.; Dresden cup and saucer, gilt inside and painted with landscapes, 23 gs.; pair of vases, supported on tripods with centre vase, Marcolini period, gros-bleu ground and painted with classical subjects, 160l.; ecuelle and cover, gilt inside, painted with landscapes, 38 gs. But the principal attraction in the sale was the English part of the collection. Battersea enamel teapot, white and gold ground painted with landscapes and flowers, 28½ gs.; Worcester teapot, spirally fluted, gros-bleu and gold, and medallions of flowers, 17l.; Leek vase of large size, with painted subject, 24 gs.; the well-known "bee" milk-jug (specimen from the Stowe collection), 34l. 10s.; Chelsea: pair of pastoral figures, formed as candlesticks, 17 gs.; figure of Minerva, 12l. 10s.; scroll vase, 12½ in. high, claret ground, 75l.; basin, gros-bleu, with medallions of birds, 35l.; Plymouth: sweetmeat stand of coloured shells, 14l. 10s.; mug, painted with exotic birds, 12l.; another of curvilinear form, similar decorations, 19 gs.; jug, similar, 12l. The Bristol porcelain was the main object of attraction, many pieces forming illustrations to *Owen's Ceramic Art in Bristol*. A chocolate cup and saucer, laurel-leaf decoration, 30 gs.; two double-handled coffee-cups and saucers, with medallions and laurel festoons, 70l.; three jugs, same decorations, 35l.; figure of Europe, 30l., and another, 31l.; the companion, Asia, 30l., and America, 40l.; oval plaque, with central figure of Britannia, 18 gs.; pair of figures in the Macaronic costume of 1770, 37 gs.; figure of shepherd and dog, 31 gs.; dish with perforated border, 34l.; figure of Winter, 70l.; teapot of the well-known service given by Edmund Burke to Mrs. Smith in 1774, 71l.; sweetmeat shell stand, 17 gs.; pair of vases, light-blue scale ground, painted with birds and insects in compartments, 100 gs.; the celebrated teapot of the Burke service, given by Champion and his wife to Mrs. Burke in 1774, which sold, when originally brought into the market, for 180l., now realised the enormous price of 205 gs. Nothing can be finer than the quality of the paste of this teapot, or more common and tasteless than the design—Cupid on an altar charged with an escutcheon, and supported by two female figures: Minerva with cap of liberty, and Plenty. A chocolate cup and saucer of the same service, 91l.

LORD MALMESBURY'S pictures were sold by Messrs. Christie, Manson and Woods on Saturday. Few of them were of much importance, and but few fetched high prices. For 189l. was sold a portrait of Titian, attributed to Sebastian del Piombo, exhibited at the British Gallery in 1848. To Giorgione was attributed a fine portrait group of the Duke of Ferrara and the mistress whom he married; it realised 367l. 10s. An important Hobbema, *A Woody Landscape with Cottages and Figures*, left by Lord Radnor, it is stated, to the first Lord Malmesbury at the end of the last century, realised 1,102l.

At a sale last week at Sotheby's of some of the effects of the late Librarian at the Athenaeum Club, there was a book containing about sixty

prints from the *Liber Studiorum* of Turner. They were of very unequal quality. The volume sold for 118l.

At Messrs. Sotheby's the Anderson-Rose Sale has been proceeding during the week. We shall make further notice of it in our next issue.

THE STAGE.

THE theatrical season has suddenly collapsed, and the week has accordingly been a quite uneventful one. A farce at the Strand is the only new production, and a farcical comedy at the same theatre is one of two revivals. Mr. Frank Green's *Dress-Coat* is fortunate in appealing to an audience that is notorious for great animal spirits. It is accepted by that audience as something even better than the majority of farces. Mr. Sketchley's comic drama shares the same favour. Messrs. Cox and Marius appear in the *lever de rideau*, and Messrs. Turner, Grahame, and Vernon, and Miss Ada Swanborough, Miss Sallie Turner, and Miss Brunell in the more pretentious performance. But it is not unlikely that the burlesque of *L'Africaine*, which ends all, will continue to be the chief attraction to the theatre.

THE *Serf* has been revived at the Olympic: not, indeed, that *Serf* produced many years since, and which we have lately heard much of as the foundation of the *Danicheff* (a claim, by-the-by, which is far from being securely established), but that *Serf* by Mr. Tom Taylor which was brought out not a dozen years since at the theatre where it is again played. Mr. Henry Neville was in 1865 the creator of the title-role; and this part he resumes. Miss Kate Terry was the original representative of the Countess de Mauléon—the French lady who has fallen in love with the serf, who is an artist in Paris—and the Countess de Mauléon was one of Miss Terry's greatest successes. Miss Carlotta Addison brings many good qualities to the performance of the part, and the piece in other respects is fairly supported. Mr. Farjeon's new play, though received with approval on its first night, is to be removed from the boards after this evening.

MRS. BANCROFT who, we are sorry to say, has been ill, has not yet been able to resume her part in *Ours* at the Prince of Wales's Theatre.

MIDDLE BEATRICE will re-appear in London on Monday, when she and her company will act *Frou Frou* at the Globe Theatre.

L'Etrangère has not had a long success at the Haymarket, and it will quietly be withdrawn to-night, to make place for O'Keefe's comedy *Wild Oats*, which they will play on Monday.

MISS ADA CAVENDISH took a benefit at the Globe Theatre on Wednesday night, when she appeared in Mercy Merrick in the *New Magdalen*; the character which is probably her best, since it contains scarcely anything which she cannot completely render. She also gave the comedy scenes of the *Hunchback*. Her style in comedy, brilliant but at times artificial, is well enough suited to that over-rated work.

MR. TOOLE is at the New Theatre Royal, Bristol.

On Saturday evening, at the College in Queen's Square, Mr. Henry Irving read *Hamlet* to a crowded auditory. He had previously read the play with a like success to a private party in a London drawing-room.

On Tuesday night Miss Cowen gave her first Recital at St. George's Hall. It was numerously attended, and we are assured that in the Balcony scene from *Romeo and Juliet* Miss Cowen showed much dramatic power. In the lighter task of reciting Miss Procter's verses *A Woman's Question* and *A Woman's Answer*, the lady well satisfied those who listened to her.

THE Porte Saint Martin has revived *Louis the Eleventh*, the most important work of Casimir Delavigne; but it is not to the Porte Saint Martin that one must go to judge seriously of the merits of a piece and an author more esteemed twenty years ago than in our own day. The representation of the secondary characters was poor: that of the principal characters at best unequal and uncertain. Twelve years since the piece was performed under better auspices at the Théâtre Français, when Gelfroy played Louis Onze with admirable art, and Delaunay gave ardour and apparently youth to the part of Nemours. At the Porte Saint Martin, the other day, the character of the King was given to Taillade: an eccentric man, whose mistakes are sometimes those into which cleverness may fall more readily than folly. Taillade, in the present performance, exaggerates what there is of meanness, lowness, and villeness in Delavigne's portrait of the King—a portrait, nevertheless, infinitely more favourable than that drawn by our Sir Walter in *Quentin Durward*. M. Regnier, who plays Nemours, is far from possessing the accomplished art of the eternal *jeune premier* of the Français. Mlle. Patry is perhaps the best: she represents the Dauphin with more of young masculine vigour than that personage is generally allowed. Having regard to the many merits of the piece and the many faults of the interpretation, it is suggested that another revival of it shall take place at the Théâtre Déjazet, which M. Ballande has just hired, "pour y réinstaller, sans subvention aucune, l'Odéon disparu."

THE *Temps*, in recording the death of M. Jules Assézat, recalls to memory his work for the drama. He edited the Brothers Garnier's large edition of Diderot, of which the seventh and eighth volumes are devoted "à la critique dramatique et au théâtre de l'illustre philosophe."

M. CHARLES CONSTANT, an advocate at the Cour de Cassation, has just brought out a little book called the *Code des Théâtres*, for the use especially of managers and actors.

M. JULES CLARETTE, the dramatic critic, is on a tour in Great Britain, and has sent some notes home. He chronicles the enthusiasm with which Mlle. Cornélie d'Anka is received at Edinburgh as the representative of Mme. Angot, and he reports his surprise and delight at the establishment of telegraphic communication between the Opera Houses and the Houses of Parliament.

Monsieur Thomassin will probably be the name of the next piece at the Gymnase. It is in three acts, and M. Landrol will sustain a chief character.

MUSIC.

MENDEL'S MUSICAL LEXICON.

Musikalisches Conversations-Lexicon. Eine Encyclopädie der gesammten musikalischen Wissenschaften. Von Hermann Mendel. Band I.—V. (Berlin: R. Oppenheim, 1870–1875.)

IN THE ACADEMY of January 22 we gave a short note on the fourth and fifth volumes of the present work, the only ones which at the time were before us. In consequence, we suppose, of that note, the publishers have now forwarded the first three volumes to our office, and we are therefore in a position to speak of the Lexicon as a whole, so far as it is as yet issued.

We have more than once had occasion to remark that for laborious investigation and compilation of detail the Germans are unrivalled; and never has this fact been more forcibly impressed upon us than during the somewhat minute examination we have

made of the five volumes now under notice. The plan of the work can only be described as gigantic. The volumes before us contain over 3,000 closely-printed octavo pages, and yet they evidently form little if at all more than half of the whole lexicon, as they only extend to the word "Karow." We have been at some little trouble to estimate the number of separate articles, varying in length from one or two lines to forty or fifty pages, and are sure we are within the mark when we say that the five volumes contain at least ten thousand. This number, however, high as it is, gives only an imperfect idea of the completeness of the Lexicon. It is not merely a biographical dictionary of musicians, though in this respect it is probably without a rival as regards comprehensiveness; it is also a voluminous cyclopaedia of musical history and science. Many of the theoretical articles are elaborate treatises written by the first musicians of Germany. Among the names of the contributors are to be found those of C. Billert, A. Dörffel, Dorn, G. Engel, Gevaert, L. Hartmann, F. Hüffer, F. W. Jähns, Langhans, E. Mach, E. Naumann, Oscar Paul, A. Reissmann, E. F. Richter, W. H. Riehl, W. Rust, W. Tappert, O. Tiersch, and H. Zopff, nearly all of which will be familiar to students of German musical literature as authorities of the highest eminence in their respective departments.

It will give our readers some little idea of the amount of research displayed in the biographical portion of this work if we say that we find notices of ten different musicians named Arnold, 25 Bach, 12 Becker, 15 Benda, 16 Braun, 17 Costa, 16 Couperin, 14 Cramer, 36 Fischer, 15 Hartmann, 14 Heinrich, 45 Hofmann and Hoffmann, 26 Johann and Johannes—to select merely a few from a much larger list before us. Tested in another way, as to the inclusion of the names of modern composers, even of those whose names are only just coming prominently forward, we have found it almost equally satisfactory, not having sought for a single name of any German musician which is not given. The opinions expressed on young and rising composers may of course be subject hereafter to some modification. We remember to have read that in an early edition of Gerber's *Musical Lexicon* it is said of Beethoven that he is a young and clever pianist, with but little aptitude for composition! and we have before us, as we write, a *Biographical Dictionary of Musicians*, printed in London in 1824, in which we are told that Auber's music displays considerable talent but is too evidently in the style of Rossini—a remark that is perfectly true of *La Neige*, the latest opera which Auber had produced when the dictionary was published, but which read fifty years later as a criticism of his works as a whole would appear simply absurd. That the present lexicon is as complete in the department of non-German as of German modern musicians can hardly be said; we have looked in vain for a few names of modern Russian composers—*c.g.* Afanasieff and Faminzin, with which we are familiar through the Russian correspondence in German musical papers; and it is characteristic of the very imperfect knowledge even among the best informed

musicians on the Continent as to the state of the art in this country that not even the name is given of Sir John Goss, one of the most eminent composers of Church music in England. It is again in the biography of an Englishman, Dr. Samuel Arnold, that we have detected the solitary mistake which has come under our notice, in the statement that his edition of Handel's works is in pianoforte score instead of in full score. This error is the more curious as there surely must be a copy of Arnold's Handel in some of the musical libraries on the Continent. Such occasional oversights as these are inseparable from a work of such dimensions as the present; they appear to be extremely rare, and it may be fairly said that the book is on the whole as accurate as it is complete.

Perhaps the most valuable parts of this Lexicon are its historical and theoretical articles. By historical as distinguished from biographical we mean the most interesting series of papers on national music, and on the history of musical instruments; and in calling them the most valuable we mean no depreciation of the other parts of the work, but simply that they contain much information which it is difficult, if not impossible, for the average student to meet with elsewhere, while mere biographical details are much more generally accessible. It will furnish sufficient idea of the scope of the work if, instead of going through the whole five volumes, and giving what would probably be a merely tedious enumeration of the contents, we confine ourselves to the portion filled by letter A. This occupies 380 pages, and gives about 1,200 separate articles, some, of course, occupying only one line, while others fill many pages. Of these articles at least 500 are biographical, the most important under this letter being that on "Auber," which is not only very complete—rather more than four pages in length—but showing a just appreciation of the genius of a French composer such as is not always to be met with among German musicians. In addition to the explanation of technical terms to be met with in most works of this kind are to be found many, especially those relating to ancient music, which we do not remember to have seen elsewhere. If this enumeration exhausted the contents of the work it would still be one of great importance, but its most valuable portion, as mentioned above, is the series of elaborate articles which, in addition to all the ordinary information to be found in other books, it comprises. Of these, under letter A we have the following: "Aegyptische Musik," "Aethiopische oder Abyssinische Musik," and "Assyrische Musik," by C. Billert, three treatises dealing, one might almost say, exhaustively with the subjects—that on Assyrian Music occupies fifteen pages—"Arabische Musik" (ten pages) by L. Arends. Other valuable historical papers are those on "Akademie," signed by "H. M."—we presume, the editor—"History of Acoustics" by C. Billert, "Alphabet" by the same, and "Ambrosian Music" by Dr. A. Thierfelder. The theoretical and practical articles are of no less importance; among these may be particularly specified Prof. Mach's elaborate paper

on "Akustik," which fills thirty-eight pages, and the shorter but most capital articles by W. Tappert on "Accent" and "Accord," and by Otto Tiersch on "Auflösung" (the Resolution of Discords). The examples given in illustration of these theoretical articles are throughout the work most excellently chosen, and embrace specimens of all schools from Bach down to Wagner. Gustav Engel furnishes admirable practical articles on "Ansatz der Stimme" (the Production of the Voice), "Athem," and "Ausdruck im Gesange;" while as a good example of an aesthetical paper may be cited that by L. Wandelt on "Anlage" (Aptitude, or natural disposition for music).

From the above brief summary of the contents of about one-eighth of the portion of the Lexicon now before us our readers will obtain a slight idea both of the completeness of the work and of the herculean labour which its editor has undertaken. A musical lexicon on such a scale has never before been attempted, and when complete it will be simply invaluable. No musician who is able to read German ought to be without it, especially as it is published at a price which for its quality is absurdly low—only a few shillings a volume. We wish editor and publisher a speedy completion of their gigantic task. EBENEZER PROUT.

MR. WALTER MACFARREN, one of our most esteemed resident professors, gave a morning concert last Saturday, at St. James's Hall, with a programme of more than average interest. In addition to Mozart's charming but (except at the Monday Popular Concerts) very rarely heard trio for piano, clarinet, and viola, in which the concert-giver was assisted by Mr. Lazarus and Mr. A. Burnett, and Bennett's sestet in F sharp minor for piano and strings, Mr. Macfarren brought forward two important compositions of his own. These were a "Suite de Pièces" for piano solo, and a sonata (No. 2, in D major) for piano and violin. The former of these works has been already favourably noticed in these columns, and, as a copy of the latter has been sent us for review, we shall defer any criticism till we can speak of it in detail. Both works were excellently played, the violin part of the sonata being in the hands of M. Sainton, and were, as they deserve, warmly received. Mr. Macfarren and his pupil, Miss Kate Steel, played Mendelssohn's Allegro Brillante, Op. 92, in an arrangement for two pianos (why not in its original shape for four hands?), and vocal music was contributed by Mrs. Osgood, Mr. W. H. Cummings, and a choir of female voices composed of students of the Royal Academy of Music, of which, as most of our readers will be aware, Mr. Macfarren is a professor.

This month's number of *Macmillan's Magazine* contains a most admirable article on "Beethoven and his Works" from the pen of Mr. E. Dannreuther. The task which the writer has set himself is to point out clearly the characteristics which distinguish the music of Beethoven from that of his great predecessors, Haydn and Mozart, and to show wherein lies the secret of the remarkable power over the emotions exerted by his compositions. So far as we are aware, the subject has not been treated before in our language—at any rate not with the same clearness and fullness. We most cordially recommend the article to the notice of our musical readers.

MDLLE. ALBANI is engaged for the next season of the Théâtre-Italien, Paris, and is to give twenty representations, playing in *Lucia di Lammermoor*, *Rigoletto*, *La Sonnambula*, *Linda di Chamouni*, and *Don Giovanni*.

THE second Westphalian Musical Festival was held at Bielefeld at Whitsuntide, when among other important works Handel's *Joshua* was performed.

THE Dutch musical society called the "Maatschappij tot bevordering der Toonkunst" held a three days' festival at the Hague from June 9 to 11. On the first day Handel's oratorio *Hercules* was performed; on the second, Verhulst's Mass, op. 20, and Beethoven's choral symphony; and on the third, a miscellaneous selection, one of the principal items of which was Schumann's symphony in D minor.

THE programme of the Silesian Musical Festival, which takes place at Hirschberg, from the 12th to the 15th of the present month, includes as its chief features Handel's *Joshua*, Wagner's "Kaisermarsch," Beethoven's "Eroica" symphony and *Leonore* overture (No. 3), Berlioz's overture to *Benvenuto Cellini*, and a selection from the opera *Die Falkensteiner* by "J. H. Franz"—the *nom de plume* of the amateur composer, Count Hochberg.

HERR NESWADBA, the conductor at Darmstadt, died on the 20th ult.

THE death is also announced from Geneva, at the age of eighty-two, of J. J. Wehrstedt, the pianist of whom Von Lenz in his *Beethoven et ses Trois Styles* gives such a curious account. This eccentric musician spent, according to Von Lenz, twenty years in the practice of one shake in Beethoven's sonata, Op. 26.

In anticipation of the approaching performances at Bayreuth, Messrs. Schott and Co. have just published a cheap edition of the complete poem of the *Ring des Nibelungen*. The whole tetralogy forms an elegant and most beautifully printed little volume of some 350 duodecimo pages, and will be interesting not only to those who are about to visit Bayreuth, but to the much larger number who will be glad of the opportunity of making acquaintance with probably the most remarkable operatic poem in existence.

SATURDAY, JULY 15, 1876.

No. 219, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Roof of the World, being a Narrative of a Journey over the High Plateau of Tibet to the Russian Frontier and the Oxus Sources on Pamir. By Lieut.-Colonel T. E. Gordon, C.S.I., &c., lately attached to the Special Mission to Kashghar. Illustrated with Sixty-six Drawings done on the spot, and Map. (Edinburgh: Edmonston & Douglas, 1876.)

SIR DOUGLAS FORSYTH'S mission hardly obtained all the geographical results that were looked for, and the use of the portable boat which Capt. Trotter hoped to float on the hidden waters of Lake Lob was confined to humbler exploration. But much valuable knowledge was collected, and we regret that the whole has not been digested and published together, instead of being scattered through independent volumes by various authors. The official report, though printed, is not published. It is a massive quarto, containing matter of various value, but much both new and curious; and with careful editing and condensation it would afford no small addition to our geographical literature. Such publication is hardly to be looked for now that Dr. Bellew has been permitted to give to the world his *Kashmir and Kashgar*, and Colonel Gordon his present volume. Dr. Bellew had six months' start in publication, but on the other hand he did not share, like Colonel Gordon, in the most interesting episode of the mission, the ride across the "Roof of the World;" though be it said that the great Himalayan plateau crossed and recrossed by the whole party between Ladak and Yarkand deserves that title better than Pamir. Colonel Gordon's sketches created much interest at the Paris Congress last year, and they constitute the chief feature of his book. It is, in fact, a pictorial chronicle of the expedition, connected and supplemented by a straightforward and unpretentious narrative, set forth in a type which is a delight to the eye. The sketches themselves are full of interest and novelty. They are literally reproduced by some new autotype process, and we must concede that the artistic result in some of the larger drawings is hardly satisfactory. The vignettes, which are introduced copiously like woodcuts in the text, are best; indeed, the effect of these is capital, and all the illustrations improve on acquaintance. Now first we see in pictorial and truthful representation those lofty tracts and solitary lakes over which we have pored in the notices of Hwen Tsang, of Marco Polo, of John Wood, and of the

Mirza, till we had them almost palpably before us. And in truth the reality is very like what our dreams pictured it.

Though we are assured by Colonel Gordon that the wild yak does not occur on Pamir, the Kirghiz have carried the domestic breed across its length and breadth. And the constant occurrence of this beast of burden is one of the novel characteristics of these sketches. The suggestion is that of a colossal Skye terrier, decked with horns and strapped with trunks.

This prolongation of the Himalya, binding the Indian Caucasus to the Celestial Mountains, this Outer Imaus, Tsung-ling, or Pamir, is the most notable watershed and natural limit in Asia. A hundred interests cluster round it, geographical, historical, ethnological, mythological. The sources of the Oxus are in the lakes that dot its lofty surface; and parted from these by hardly the elevation of a mole-hill are the sources of the Tarim, which flows eastward to that obscure Lake Lob; but which, according to Chinese legend and Hindu cosmography, finds its way onward to the Eastern Ocean. The *origines* of the Aryan nations have often been deemed traceable to the skirts of this region, and round these skirts still cling many singular fragments of Aryan race and Aryan speech. It was the earnest ambition to explore Pamir that cost poor Hayward his life. And the late ardent and accomplished traveller, Alexis Fedchenko, tells us that his heart's desire also, the vision before his eyes from the day that he first set out for Turkestan, was to reach Pamir.

Colonel Gordon and his colleagues confirm what Mr. Severtzoff stated some years ago, that *Pamir*, correctly speaking, is not a proper but a generic name. "What's the use of writing down so many names?" said to Dr. Bellew a Kirghiz, wearied by much geographical catechising; "we call one country Aláy, and another Kizil Art, and we call every spread of pasture *pámir*, just as we call a stony plain *sáy*, and a slope at the foot of a hill *sirt*." We need not cite the briefer explanations of Bellew and Gordon, because Fedchenko's account of the Alái Steppe, when compared with these and with Colonel Gordon's sketches, gives a clearer notion of what a *pámir* is; though the Alái itself, perhaps owing to its lower altitude, admitting of partial cultivation and winter occupation, does not bear the designation. The description is too long to quote verbally, but it amounts to this: The Alái is a valley some forty miles in length, lying between two parallel ranges. The floor of this valley is flat, but rises longitudinally from west to east, and as it rises spreads over the outlying portions of the parallel ranges. It is thus much wider at the eastern or upper end, where the crests of the ranges hardly rise above the diluvial floor; while at the western or lower end this floor sinks between the outliers of those ranges until it terminates in a defile barely giving exit to the river which drains the whole.

Indeed, the *pamirs* seem to correspond nearly, if not precisely, to those lofty valley-floors of diluvium which the people of Western Tibet call *Chang-tang*, or "Northern Plains," as lucidly described by Capt. H. Strachey in the twenty-third volume of the

Journal of the Royal Geographical Society (p. 21, &c.).

Though the word *Pamir* seems to be thus rightly generic, like so many other geographical names, it has been appropriated to this high region certainly for twelve centuries, and possibly for many more. Hwen Tsang (*circa* A.D. 640) gives the name in Chinese syllables as *Pomilo*, nearly the form used by the Alái Kirghiz now. It used to perplex us why Hwen Tsang described as a valley what we were accustomed to regard as a wide-spreading steppe, but we now see that the venerable "Master of the Law" was perfectly right. The name also appears (*Bámír*) in the positions of Al-Birúní (*circa* A.D. 1020) as protracted by Prof. Sprenger (*Post-und-Reise-Routen des Orients*); and it reappears (*Pamer*) in Marco Polo.

Hwen Tsang's notices of Buddhist edifices in the high (though *sub-pamirian*) regions of Wakhán and Sirikol led us to hope that some traces of these might still be found. Colonel Gordon's narrative hardly establishes a negative, though it discourages expectation. The *Chihil Gumbaz*, or "Forty Domes," which native explorers mentioned in a valley adjoining Sirikol, prove to be only Kirghiz tombs. The fort of Tashkurghan (or Sirikol) itself, which some had fondly connected with the Stone-Tower of Ptolemy, and others with the Kabandha of Hwen Tsang, is alleged to show no signs of antiquity, though, be it said, the travellers were not allowed to enter it; and the like is said of the so-called *Káfir* Forts of Wakhán. Now, though Wakhán is spoken of by Ibn Haukal at the end of the tenth century as still *Káfir*, it has certainly been Moslem for 600 years (as we know from Marco Polo), and probably a good deal longer.

Next to Wakhán, in descending the Panja stream of the Oxus, is the small State of Ishkashm, in which the river makes that sudden bend to the north which has been now first explored by a native surveyor of the expedition. Ghárán ("the caves") follows, in which lie the ruby-mines which carried the name of Badakhshan, in the form *Balas*, into mediæval Europe. Then come Shighnán and Roshán, two States under one prince, who bears the title of *Sháh*. Beyond Roshán is Darwáz, also visited recently for the first time by one of Colonel Montgomerie's surveyors, "the Havildar."

In Shighnán the Panja receives from the Pamir side a very large tributary, as Captain Trotter states (*Report*, p. 279), formed by two streams, those of *Shákh-darah* and *Ghund*:

"Both the Shákhdarah and the Ghund Rivers have numerous villages on their banks. . . . On the former, at two days' march from Bar Panjah, is the large fort of Rách, the residence of the Governor of the Shákhdarah district, which is said to contain about five hundred houses. The Ghund valley, the chief place of which is called Charsim, is said to contain about seven hundred houses. Roads lie up both these valleys to the Pamir steppes. . . . The direct road to Kashgar up this valley (Ghund) is said to be a much easier road than that by Tash Kurghan [which the Mission followed]."

The names of both streams are worthy of note: the *Shákh Darah* (or "Glen"), because it probably (in spite of a trivial meaning on the surface) preserves the name of the *Sacas* whom Ptolemy locates hereabouts;

the *Ghund*, because we recognise in it a name occurring in the history of the House of Timur, as translated in the *Notices et Extraits*, tom. xiv. pt. i. In 1411, Beháuddín, King of Badakhshan, of the old dynasty claiming descent from Alexander, having revolted against Sháh Rukh, the Prince in charge of Balkh entered Badakhshán, driving Beháuddín into the wilds; and we are told his forces advanced beyond the *Ruby-mines*, and penetrated "to the districts of *Saknán*, *Ghand*, and *Bámír*, in which lies the source of the *Jaihún*" or *Oxus*: a sequence exactly corresponding to the geographical relation of Ghárán, Shighnán, Ghund, and the Pamirs, as we see them in Captain Trotter's map.*

But the passage, showing as it does that one of the easiest roads across the Great Divide to Kashgaria runs thus from the *Oxus* valley in Shighnán, recalls associations older far and more striking than petty wars of the Timuridae.

Ptolemy in his introductory book, when discussing the length of the inhabited earth, treats in some detail an itinerary given by his predecessor Marinus, which had been noted on a trading journey to the Seres (i.e. to China) by Maës Titianus, a Macedonian merchant. The route ran from *Aria* (Hari or Herat) to *Margiania Antiochia* (Merv), and thence eastward to *Bactra* (Balkh). Thence it bore north up to the hill country of the *Comēdae*, after which it inclined somewhat south again

"as far as the *φάραγξ* or gorge in which the plains terminated. From this a distance of fifty *schoeni*, extending to the Stone-Tower, would seem to tend northward. This Stone-Tower stands in the way of those who ascend the gorge, and from it the mountains extend eastward to join the chain of Imaus,"

i.e. the Himalya.

The key to this route is the position of the *Comēdae*. And this the Chinese Hwen Tsang, stretching out a hand to the Alexandrian geographer, enables us to define almost with precision. He tells us that *Kumidha* lay to the eastward of *Khotl* (still *Khotlán* or *Kuláb*) in the lap of the Tsung-ling mountains. The *Shighni* country (*Shighnán*) lay to the south of *Kumidha*, and the *Potsu* River (*Oxus* or *Panja*) flowed by its S.W. border (*Pèlerins Bouddhistes*, II. 27). The position is that of *Roshán* and *Darwáz*, and the name of the capital of the latter, *Kúm*, probably preserves a memorial of *Kumidha*.

But a rough diagram will spare many

* As usual when one meddles with the *Oxus*, I find that Sir H. Rawlinson has anticipated my reference to *Ghund* (see *J. R. Geog. Soc.*, xlii. 498).

words in showing how exactly the position suits the route of the Macedonian caravan across Pamir. The mention of "the gorge in which the plains terminated" may refer either to the gorge of the great *Murgháb* or *Bartang* branch, which joins the *Panja* in *Roshán*, or to the defile of *Darband* on the *Panja*, two or three miles above that confluence, where the *Panja* valley contracts suddenly from a width of five miles to nothing. The route across Pamir, whether up the *Murgháb*, or (if that be too difficult, as Captain Trotter's information intimates) round by the *Ghund* or the *Shakhdarah*, would tend again northward, as the Macedonian route did from "the gorge" to the *Stone-Tower*. The position of the *Stone-Tower* itself is then to seek high on the *Murghab* above *Bartang*. Four days east of the latter, and near a spot known as *Akbálig*, the *Kirghiz* told Colonel Gordon (p. 159) there were the ruins of an old

graphical Society, xxxvi. 257). Now, Colonel Gordon mentions that in *Shighnan* "much wine is drunk . . . it is a red sweet liquor produced from the cherry" (p. 140). We may yet find that *Klaproth* had authority also for the *Dutch cheeses* which the "German Traveller" found in the same vicinity (ib. p. 258), improbable as they seem!

One of the native explorers (*Faiz Bakhsh*) applies the name of *Kul-i-Sikandari* (*Alexander Lake*) to the *Lake of Great Pamir*, which *Lieut. Wood* called, apparently by some misunderstanding, *Lake Sirikol*. There is really a lake called *Sikandar*, or *Iskandar*, in the highlands at the sources of the *Samarkand River*; but Colonel Gordon assures us (p. 162) that none of the guides recognised the name as applied to the *Lake of Great Pamir*. This affords occasion to notice a circumstance alleged by *Mr. Grant Duff* in his *Notes of an Indian Journey* (p. 105):

"As I drove yesterday with —, I asked him if he knew the scientific name of the tall grass which I heard called *tiger-grass* at *Ahmedabad*, and which is very abundant here. I think it is a *saccharum*, but am not quite sure. 'No,' he said, 'but the people in this neighbourhood call it *Sikunder's grass*, as they still call the main branch of a river *Sikunder's Channel*.' Strange—is it not?—how that great individuality looms through history."

Without impugning the closing sentiment, we must express grave doubt about its illustrations. We feel sure that "*Sikandar's Grass*" was a mere corruption of the common Hindustani word *sirkanda*, applied to a grass of the kind indicated, often used in making mats. *Williams* (*Sanskrit Dictionary*) gives the original form as "*Sara Kānda*, the stem of the *saccharum sara*, a reed-stalk, the shaft of an arrow." And it may be suspected as possible that "*Sikandar's Channel*," if really used generically, is based on some other corruption.

It is a remarkable circumstance, noticed by Colonel Gordon (p. 134), that the *Shiáh* people of *Wakhán*, and of some others of those secluded highland States, are disciples of *Agá Khán* of *Bombay*, and annually send to that remarkable personage, the living descendant and representative of the *Veglio della Montagna*, and pillar of the *Bombay Turf*, an offering of the tithe of their produce.

The photographic apparatus seems to have succumbed to the long marches in the snow, and in consequence the Mission has given us no photographs of the people of *Wakhán* or *Sirikol*. This is much to be regretted, for neither descriptions nor sketches are precise enough to give us any just idea of the ethnographic relations of these interesting groups of people. There is, indeed, one photograph (in the Mission Report, No. 78), entitled "*A Nogai from Omsk and a Native of Sirikol*." But even if we knew "which was which," the figures are too small and too obscure for comparison. H. YULE.

THE committee for the *Spinoza Memorial* at the Hague has announced that on February 21, 1877, the second centenary of *Spinoza's* death, they will lay before the subscribers the final plans for the monument which is to be erected in honour of the great Dutch metaphysician.

Remains of the late Rev. Arthur West Haddan, B.D. Edited by A. P. Forbes, D.C.L., Bishop of Brechin. (Oxford and London: James Parker & Co., 1876.)

A MELANCHOLY, almost a painful, interest attaches to the circumstances under which this volume is given to the world. Its contents recall to us the loss of a great scholar and vigorous thinker whom learning and the Church could alike ill spare; while a brief sketch of his life by a brother, Mr. Thomas Haddan, and a notice added by the publishers, as the last sheets were passing through the press, remind us that biographer and editor have both since also been removed by death.

Of Arthur West Haddan it may be said that he was emphatically a worker. Whether as a schoolboy devoting his leisure to Italian, as a *παιδαγωγός* to his allotted studies—or as an undergraduate, reading for a double-first (a distinction which through illness he just missed)—or as secretary to Mr. Gladstone's first Election Committee at Oxford—or as joint editor of that enduring monument of his erudition, the *Councils and Documents*—whatever his hand found to do he did it with all his might. He was of the very chivalry of learning, combining with a true devotion to letters a singularly fine sense of the obligations that devolve upon the author and the critic.

"No passion, no predisposition," says his editor, "no foregone conclusion influenced the man. Nor did the interest of great events induce him to slur over what was less important. A disputed succession in an obscure see in Scotland or Wales would receive the same care and consideration as the change of a dynasty or the establishment of a hierarchy. All events, whatever their importance, were regarded in their reference to that which formed the underlying principle of his exhaustive method, the pre-eminent sanctity of historic truth."

The present volume gives us nothing new, but it brings together a series of contributions to the *Guardian* and the *Christian Remembrancer* which all scholars will be glad to see republished in a connected form, and which cannot but bring home very forcibly to the reader the profound and accurate learning, the untiring research, and the clear judgment of the writer. The editor has confined himself to the simple arrangement and classification of the papers. The first two sections comprise those on "The Holy Scriptures" and "Doctrinal Views;" these are reprinted entirely from the *Guardian*, and, in many cases, extend only to four or five pages. To the theological student, however, their very brevity will often be a recommendation. They embody in a condensed form the views of a moderate Anglicanism with respect to the more important questions in Biblical criticism and Church doctrine that have come before the world during the past twenty years; and many a reader, unable or unwilling to bestow the time necessary for reading through the six volumes of Lange's *Life of Christ*, or the five volumes of Dorner's *History of the Doctrine of the Person of Christ*, will yet be glad to find, as here, a succinct and careful estimate of the merits of those works from the standpoint of a writer of this school. The criticism, if not free from bias,

is never vehement or vaguely denunciatory; for weapons like those with which critics of a certain school of English orthodoxy have long been wont to oppose the most profound and convincing conclusions of German theology of almost every shade were foreign to Mr. Haddan's whole temper and habits of thought.

The third section, containing the articles on "Ecclesiastical History," which fills nearly half the volume and represents at least five-sixths of its value, is, however, that to which most will turn with the greatest interest; and in the criticisms on Montalembert's *Monks of the West*, *The Churches of the British Confession*, *Scots on the Continent*, and *The Early English Church*, the reader will find sufficient evidence of that remarkable acquaintance with Celtic and Saxon antiquities which even so experienced an investigator as Mr. Freeman pronounces "astonishing," and wherein Mr. Haddan's great superiority undoubtedly lay.

The criticisms on Montalembert's brilliant but inaccurate volumes exhibit in striking contrast the spirit of Anglican and Romanist belief—Romanist, that is to say, as it existed before 1870. Notwithstanding the intellectual vigour and real learning of the celebrated Frenchman, his canons of criticism and statements of fact alike crumble before the test to which they are here subjected. In the relations that existed between the ancient British and Gallic Churches there is much in which a modern French writer might find reasonable grounds for complacency. The superiority enjoyed by the latter over the former is unquestionable. "Hilary of Poitiers," as Mr. Haddan says, "Martin of Tours, Germain of Auxerre, successively sway the British Church as absolutely their own;" and Wilfrid seeking episcopal consecration in Gaul in the seventh century is another noticeable instance how these traditions still, at that time, exerted their influence. Montalembert, however, almost wilfully shutting his eyes to these and similar facts, preferred the assumption of an acknowledged and generally recognised Romish supremacy in Britain in these centuries. Wilfrid's appeals to Rome, he imagined, constituted in themselves sufficient proof that the rights of investiture were already conceded to the Pope in England, and he was even guilty of so serious an anachronism as to censure the bishops of the English Church of that day for their ignorance of the False Decretals. All this, it need scarcely be said, is satisfactorily disposed of by his critic, who points out that in the sequel the English Church established its position, both king and bishops satisfactorily maintaining their ground against Papal usurpation. In fact, Mr. Haddan's interpretation of Wilfrid's career and character constitutes a new reading of this period of Church history, and has now been accepted by every competent writer on the subject from Mr. Freeman down to Mr. Green. How much light he has thrown on the question may be seen by a comparison of his treatment with that of Milman. To the latter, though his sketch of Wilfrid is one of the most elaborate in his *History*, the causes of that prelate's long struggle with the authorities of the Church at home seem

"lost in obscurity." Mr. Haddan shows that Wilfrid's appeals were really the first of a series of systematic efforts to subject England to Rome. Much, doubtless, is best explained by the character of his genius. "A sheer love of power, of being first and greatest," this it was which made Wilfrid "keep so tenacious a grasp upon a see stretching from Forth to Humber, and for a little while including Lincolnshire as well." Singularly enough, it was to a foreigner, and one too of the Pope's own choosing, "the lines of whose building in the Church of our land underlie its foundations and remain in substance unchanged to this very day," that English ecclesiasticism, at this period, was indebted for the preservation of its independence. The whole criticism on Theodorus constitutes a valuable correction of Dean Hook's appreciative but inaccurate sketch.

Not less masterly is the manner in which, as in the *Councils*, only more succinctly, the writer here disposes of the theory of a so-called "Orientalism" of the British Church—that is, of an Eastern or Greek tradition with respect to ritual. At the same time it is equally clear that the conformity ultimately arrived at to the prevalent usage of the Latin Church in the observance of Easter was not the result of mere servile deference to Rome.

"The argument," says Mr. Haddan, "was not 'the Pope wills this, therefore by a fundamental principle of the Church it is obligatory'—but, 'the whole Church except ourselves, Alexandria, the East, Rome, and all, keeps Easter by the new cycle, and therefore the presumption is strong against a little corner of the world by itself, which, having no ground save its own tradition, keeps it otherwise.'"

Of the real work and influence of the English, or, as he terms it, the Saxon Church, as she existed in filial though not servile relations to Rome, he thus speaks:—

"Had it not been for her, the Christian world might well have seen, in the seventh century, a combination of Churches, of which the British Islands would have been the nucleus, and its advanced posts stretching from Iceland at one extreme, to Columbanus' convent of Bobbio on the Lombard plains at the other, with almost everything that can constitute a distinct and vigorous school of religion—learning, devotion, missionary zeal, and extraordinary missionary aptitude—all flowing in home-made channels, and marked off by the not unimportant badges of a peculiar clerical habit, and a special fashion of ecclesiastical plain-song, and of ritual, and of liturgy, and by its own calendar of festivals—as widely spread and far better united than the Rome itself of that day, untorn by dissensions, unassailed by Arian barbarians, and as independent of Rome as the patriarchates of Antioch or Alexandria."

But the article most calculated to arrest the attention in this series, is certainly that entitled "Scots on the Continent"—"Scots," it need scarcely be said, being at this period used to denote Irish Celts. Even those students of history to whom ecclesiastical antiquities and theological controversy seem least inviting, will read with interest and probably with something of surprise, of a race of scholars who from the sixth to the tenth century went forth from Banchor and Lindisfarne, protesting alike against Roman dictation and Augustinian doctrine, uphold-

ing Greek learning and philosophic speculation when these were almost extinct at Canterbury and York, asserting the freedom of the will, believing in the existence of Antipodes, by far the best astronomers of their time, and who, as they pondered over the pages of Martianus Capella—that strange medley of philosophy and pedantry—well-nigh anticipated the theory of Copernicus. Of the remarkable and interesting progress of this school, as it followed in the wake of St. Columban, forming into famous societies at Luxeuil, St. Gall, and Bobbio, and branching off into minor foundations at Reichenau, Disentis, Remiremont, Lure, Jouarre, Faremoutier, Lagny, Hautvillers, Montier-en-Der, Fontenelle, and Jumièges, the whole article offers an admirable chart. Into the collateral question of the learning and doctrinal views that characterised the movement, Mr. Haddan enters less fully. There are, indeed, indications that his researches into the Carolingian era and Frankish history had scarcely been prosecuted with the same exhaustive thoroughness that belongs to his work in other fields. He quotes, for instance, the story told by the *Monachus Sangallensis*, of the manner in which Clement of Ireland and his companions became installed as instructors in the Palace School of Charles the Great, and greatly to our surprise seems disposed to give credit to the narrative. We can hardly doubt that further investigation would have led him to reject it; certainly M. Ozanam's acceptance of the story is but a slight argument in its favour. Then, again, he speaks of Alcuin, Theodulfus (the Bishop of Orleans), and Clement, as a "triumvirate" of instructors at the Palace School; without apparently recalling how bitter at this time was the feud between the Irish and the English clergy, and what a sad lament Alcuin addressed to Charles when he heard at Tours that Clement had actually been installed as his successor, or how fiercely Theodulfus satirised the "Scotellus." To speak, again, of Alcuin as "Irish-taught" is calculated to give a false impression of the whole traditions of the school at York.

The position and character of the Irish Church at this period seem to claim more than ordinary notice at the present time. That communion had not, it is true, as Ussher fancied, anticipated Protestantism, but, to quote Mr. Haddan once more, "in the gradual development of the Papal power she remained in her isolation a standing proof of the novelty of theories unknown to the Church in earlier times, a living instance of what had formerly been held for truth, an island not absorbed by the rising waters of the Papacy, until, indeed, the twelfth century." In fact the standpoint of the Irish theologian in those days, making due allowance for the experience acquired in the lapse of a thousand years, if not identical with that which Old Catholicism is now seeking to establish, at least resembled it in a remarkable degree.

There yet remains much to interest in this volume which we are compelled to leave unnoticed. Fragmentary as are its contents they often far outweigh in value many a carefully elaborated and completed discourse on the same subjects. And if

there be anything to qualify the pleasure it will afford to all true scholars, it will be the regret that the dispensers of patronage in that Church which the writer so nobly served altogether failed either to aid or adequately recognise labours equally dignified in the spirit in which they were undertaken and illustrious in their actual results.

J. BASS MULLINGER.

Myths and Songs from the South Pacific.

By the Rev. William Wyatt Gill, B.A., of the London Missionary Society. With a Preface by F. Max Müller, M.A., &c. (London: Henry S. King & Co., 1876.)

THE religion and mythology of the Polynesian race have often been treated before, as Prof. Max Müller says in his Preface to the present work, but we ought not on that account to be less grateful to Mr. Gill for his most valuable collection of songs and stories from Mangaia. It is not only because their home "has kept itself freer from foreign influences than almost any other of the Polynesian islands" that they have a special value; their exceptional worth is to a great degree the result of their collector's methodical and conscientious labour. The legends he has translated have about them a refreshing air of genuineness; they are simple, straightforward, and free from provoking ornaments of style. And his own remarks are thoroughly sensible and to the point. The whole work forms a most important contribution to the stores placed at the disposal of comparative mythologists. Mr. Gill's materials cannot be too largely drawn upon, nor can Prof. Max Müller's prefatory words be taken too seriously to heart. To comparers and dissectors of Popular Tales the Mangaian stories ought to prove as instructive as interesting. Not that they will always startle by their novelty, for many of them have been told before, and similar fictions will occur to readers versed in American mythology—or at least in such well-known works as those of Mr. E. B. Tylor. But as they appear to have been conscientiously treated, they can be appealed to as authorities, and as they are methodically arranged, they are capable of producing a distinct and lasting impression. On the great mass of the folk-tales of Europe they throw no light whatsoever. From them they are as wide apart as are the tales of the Greenlanders. But to the student of European folk-tales they are exceedingly valuable, as showing the wide difference between a myth in its original state and a story which, though probably based upon a myth, has been so altered by singers or tellers who troubled themselves little about other than mundane ideas, that its mythological features have become well-nigh irrerecognisable. Neither from Greenland's icy mountains, nor from the summer isles of Eden studding the Southern Seas, has been drawn such inspiration as enabled the forgotten story-tellers of the past to construct the elaborate fictions which we know through the modernised forms of Cinderella or Beauty and the Beast.

The Eskimo narrators had to struggle against unusual difficulties. Romance is inconsistent with Arctic cold and a blubber

diet, and humour must languish during the long winter nights in which a jester may be reduced to feel about for an appreciative smile. But the conditions of existence are less exacting in the case of the Polynesian islanders. To them nature has shown grace, and, if the reports of travellers can be believed, they are not unaddicted to romance. But it does not seem to enter into their popular fiction. Of fancy and imagination their songs and stories are by no means devoid, but the creative faculty of the relator of traditions has been subordinated to the retentive, and the poet has not been allowed to encroach upon the domain of the priest.

A few resemblances will be found between Polynesian and Hellenic mythology. As Prof. Max Müller justly says, "Who can read the Mangaian story of Ina (the Moon) and her mortal lover, who, as he grew old and infirm, had to be sent back to the earth to end his days there, without thinking of Selene and Endymion, of Eos and Tithonos?" Here is the story:—

"It is said that Ina took to her celestial abode a mortal husband. After living happily together for many years, she said to him: 'You are growing old and infirm. Death will soon claim you, for you are a native of earth. This fair home of mine must not be defiled with a corpse. We will therefore embrace and part. Return to earth, and there end your days.' At that moment Ina caused a beautiful rainbow to span the heavens, by which her disconsolate aged husband descended to earth to die."

Several links with European mythological tales are offered, also, by the story of Maui, the Polynesian fire-bringer. The son of Ru, the "heavens-supporter," and of Buataranga, the "guardian of the road to the invisible world," two of the "four mighty ones" who dwelt in Avaiiki, the nether-world, he was appointed "one of the guardians of the upper world where mortals live," and to which fire was unknown. Visited at times by his mother, who brought with her cooked food from the lower world, he followed her one day, carried on or in a red pigeon, through a black rock which opened and shut, after Symplegades fashion, in obedience to the magic words:—

"Buataranga, descend thou bodily through this chasm.

The rainbow-like must be obeyed.

As two dark clouds parting at dawn,

Open, open up my road to nether-world, ye fierce ones."

As in many European stories the closing rock snaps off a piece of the hero's magic horse, so in the Mangaian it tears away the pigeon's tail. Noteworthy is it that the snapping rock (or the guardian demons set to watch it) is addressed by "the names of the two clouds which are parted by the rising sun." Buataranga sent her son, when he begged to be told the secret of fire, to the fire-god Manike, who gave a firebrand to his visitor. Extinguishing it in a stream, Maui asked for a second, and then for a third. On the importunate beggar's fourth visit the fire-god waxed wroth, and a fight began which ended in Manike being forced to submit, and to reveal the treasured secret. Having learnt how to produce fire from wood by friction, Maui returned to the upper world, after burning the fire-god in

his abode. And he revealed the secret to mankind, ordering them, when plying their fire-sticks, to chant "the fire-god's song," beginning with the lines

"Grant, oh grant me thy hidden fire,
Thou banyan tree!"

This form of the legend differs in many respects from the Maori variant given by Sir George Grey in his *Polynesian Mythology*, in which fire is the property of a goddess, from whom it flows when she pulls out one of her nails. In poetic expression (of an apparently modern and European character), the tales of Mangaia often fall short of those of New Zealand. There is no story quite as striking as that of the Ponaturi, as given in Sir George Grey's collection—the 'strange people who dwell all day beneath the waters, but ascend to the dry land as soon as the sun has set; and who are at length destroyed by being kept in a darkened house till after sunrise, and then being suddenly exposed to the light. Nor is there any passage so suggestive of literary influences as the close of another New Zealand legend about the violent disruption of the Heavens and the Earth—

"Up to this time the vast Heaven has still ever remained separated from his spouse, the Earth. Yet their mutual love still continues—the soft warm sighs of her loving bosom still ever rise up to him, ascending from the woody mountains and valleys, and men call these mists; and the vast Heaven, as he mourns through the long nights his separation from his beloved, drops fervent tears upon her bosom, and men, seeing these, term them dewdrops"—

a passage by which some critics may be affected as Māui was, when he peeped into his mother's basket "and discovered cooked food." It seems that "he was decidedly of opinion that it was a great improvement upon the raw diet to which he was accustomed."

Mr. Gill seems to have refrained from improving upon his raw material, especially as regards the songs, which he has made no attempt to render poetical in form. Many of them are of great value as fragments of a Mangaian metrical mythology, intended either to assist the memory in retaining religious beliefs intact, or to produce an effect of a magical kind when employed as incantations. Without a commentary such songs would be far from intelligible. Take the following as an example:—

"Vena was enraged against Aldebaran,
On account of the brilliance of his rising.
She demanded if he recollected the fate of the
Pleiades,
Shivered by Sirius and his friends.
Alas! ye bright-shining gods! Bright-shining
gods!"

The explanation is that the Pleiades (Mata-riki, or Little-Eyes) originally formed one star. Its brightness irritated the god Tane, who attacked it, aided by Aldebaran and Sirius. It hid behind a stream, but Sirius drained the stream dry. Then "Tane hurled Aldebaran bodily against the exhausted fugitive, who was thereby splintered into six shining fragments." By explanations of this kind Mr. Gill has immensely enhanced the value of his collections. Brief, sensible, and always to the point, they are exactly what is required. From them we are enabled to gain a clear idea of the visible

and invisible universe as it presented itself to the priestly mind of Mangaia in heathen days. The precision with which Polynesian mythologists laid down their celestial and infernal charts is surprising. According to Mangaian teaching the world is cocoa-nut shaped. The interior of the shell is Avaiki, the "nether-world" or land of spirits. At various depths are different floorings, or lands, communicating with each other. At the bottom is "a thick stem, gradually tapering to a point, which represents the very beginning of all things." This point is a spirit or demon, without human form, named "The root of all existence," which sustains the whole fabric of the universe. Above it is a stouter demon called "Breathing, or Life," and the thickest part of the stem is "The long-lived," the third and last of the primary, ever-stationary, sentient spirits who themselves constitute the foundation, and ensure the permanence and well-being of all the rest of the universe. Above the stem is the home of a female demon, so cramped for want of space that her knees and chin touch, called "The very beginning." From pieces of flesh which she plucked off her sides sprang into life, and tenanted the various floors or strata of the lower world: Raka, or Trouble, who presides over the winds; Echo, whose home is in "the hollow grey rocks;" Tango, or Support, who dwells in "the land of red parrot feathers;" and Tinirau and Vātea, semi-piscine beings, of whom the latter became the father of gods and men, his name signifying "noon" in all the dialects of Eastern Polynesia. According to one legend he possesses "two magnificent eyes, rarely visible at the same time. In general, while one, called by mortals the Sun, is seen here in this upper world, the other eye, called by men the Moon, shines in Avaiki." A sixth child, a daughter named "Stick by the parent," lives with the Great Mother at the bottom of Avaiki, in "The Mute Land," a region in which the only language known is that of signs. On the outside of the cocoa-nut shell, and just at its apex, is the island of Mangaia. On either side are the two apertures through which the sun and moon descend into, and rise out from, the nether-world, answering to the "smoke-holes" which lead from the lower to the upper world in the mythological tales of South Siberia. One legend asserts that the sun descends into Avaiki to visit his wife, "Stick by the parent." Another states that there used to be a direct road into the nether-world. But the denizens of that spirit-land became so troublesome that a female Curtius, named Tini, "rolled herself alive down into the gloomy opening, which immediately closed upon her." Bending in successive arches above the upper curve of the cocoa-nut-shell world are the paradises set apart for happy warriors.

Vātea, the first-born child of "The very beginning," as he dwelt in his home called "The Thin Land" (from which some of the islanders imagined Captain Cook must have climbed up when he first appeared among them), was sometimes visited by a fair stranger during his sleep. Not being able to find her when he awoke, he "scraped a quantity of cocoa-nuts and scattered hand-

fuls down all the chasms in his territory." Before long he saw a slender hand stretched out towards the fruit. Dropping downwards, he secured its owner, who became his wife. From her—whose name was Papa, or "Foundation," and who was the daughter of "Nothing More" and his wife "Soft-bodied"—sprang "the first beings of perfect human form," Tangaroa and Rongo, some legends asserting that Tangaroa sprang, Athene-like, from Papa's head. In after times all fair-haired children were considered to be Tangaroa's, for he was sandy-haired; while the dark-haired majority are Rongo's, for Rongo's hair was black, as became the "god whose name is in the shades."

There is not a chapter in Mr. Gill's book that is not rich in valuable and interesting material. Particularly striking are those which treat of the dead and of human sacrifices. To read them is, to use Prof. Max Müller's words, "to find ourselves among a people who really believe in gods and heroes and ancestral spirits, who still offer human sacrifices, who in some cases devour their human victims, trusting that the scent will be sweet to the nostrils of their gods;" and to do this, as he remarks, "is as if the zoologist could spend a few days among the Megatheria, or the botanist among the waving ferns of the forests buried beneath our feet." Would that all who write about the various subjects on which Mr. Gill's book throws such welcome light would address themselves to the task in such a spirit as manifests itself throughout the Professor's grave, cautious, wise preface—an essay which is well worthy of being classed among the best of his writings. Without it, there might have been danger of the myths, to the collection and editing of which Mr. Gill has devoted so much time and work, being twisted into alleged evidence in favour of all manner of opposing theories. By its aid the explorer who attempts to trace religions to their source will be enabled to use without abusing what "to anyone who thinks that all religions begin with fetichism, all worship with ancestor-worship, or that the whole of mythology everywhere can be explained as a disease of language," may well be recommended as "one of the most useful books at the present moment." W. R. S. RALSTON.

Social Architecture; or, Reasons and Means for the Demolition and Reconstruction of the Social Edifice. By an Exile from France. (London: Samuel Tinsley, 1876.)

This author is a native of Styria, who was expelled from France as a dangerous character in June, 1848, and has since that time lived in England. Here, by attending Karl Marx's lectures, and reading the works of Sir T. More, R. Owen, Mill, Ruskin, Fitz-james Stephen (who will be astonished to find himself in such company), and others, he has been enabled to mature the comprehensive system for the regeneration of society described in this book. Readers acquainted with Socialistic literature will not find much that is new in it. Indeed, the writer himself acknowledges that it is little more than an attempt to combine and arrange in a systematic whole the communistic "ideas of many great writers on the social problem."

Viewed in this light, the book has its useful side. But in so far as it aspires to be more than this, and to lay down practical rules and methods by which the ideas of social philosophers are to be brought to bear upon and worked out in the ordinary life of men or nations, it seems to us a very elaborate failure. For what is the use of building up ever so beautiful and complete a social edifice in the air when you persist in resting it upon such foundations as these, which we take from the "immediate requirements" in the "first stage of progress" in social reconstruction. A tax, to be called the "Industrial Relief Tax," is to be imposed on all employers of labour, and expended in pensions and compensations to aged and disabled workpeople; and an "assistant-wage" is to be paid by the State to all workmen beyond their ordinary wages, to begin at the age of 20, on a graduated scale and so that those employed in dangerous, unhealthy, or repulsive labour will obtain the largest share (p. 431). Noblemen and gentlemen who surrender their lands to the State for national distribution are to be compensated by Parliament, and "the mansions and parks are to be converted into places of public recreation and retreat; care being taken by special provisions for the preservation of historic buildings" (p. 430). This is to be one of the first steps towards the complete abolition of private property. For the State is to become sole owner of every species of real and personal property, "all expropriation to be effected through equitable compensation" (p. 428). To the somewhat commonplace and obvious objection that owners will oppose the abolition of property, we are told that "reason will enlighten them, and they will voluntarily renounce their claims" (p. 411)! For "when the beauty of the new social system becomes apparent to all . . . the very possessors of money themselves will hasten with joy to deposit their gold and silver in the national vaults appropriated for the reception of precious metals; and these very men will with alacrity consign their bank notes, cheque books, bills of exchange, and shares to the flames" (p. 85).

Perhaps one may safely allow that "when the beauty of the new social system becomes apparent to all" this will happen. Meantime, let us look at some of the leading features of the society of the future. Marriage is "the occult cancer of society" (p. 21), and will be abolished; but "sexual unions" will be arranged for all, the State providing comfortable apartments; and "wedding outfits will be drawn from the national wardrobes and magazines, and the jewels they wish to wear on the wedding-day will be lent to them by the national treasury," &c. We shall not be surprised now to hear that the social reformer condemns "the private home" (p. 24), for which associated homes will be substituted. To these will be attached (besides factories, workshops, &c.) national boarding-schools, into which all children will be drafted at the age of three, this latter arrangement making the dissolution of "sexual unions" comparatively easy where either party desires it.

The evil practices arising from the use of money can only be remedied by its "total

abolition." The very day that money is abolished, we are told, "the law that if a man will not work neither shall he eat will become a stern reality" (one scarcely sees why), and a large number of persons engaged in its manipulation will become available for the performance of useful labour. "The abolition of luxury" will follow (p. 138, &c.); but, inasmuch as an irresistible desire for wearing finery will always possess some portion of the female population, the "new social State will only impose upon these silly women the condition that they shall do all the work required. Thus, if they wish to wear silk dresses, they must rear the silk-worms, spin the silk, wind it, dye it, weave it, and make it up; and "this will teach them the difference between luxury procurable in the old State by money and in the new by labour only" (p. 141). In like manner smoking and drinking will not be absolutely forbidden to those who choose to cultivate and manufacture their own tobacco and wines, in addition to the useful labour which they will have in any case to perform for the community. By the simplification of life under the new social arrangements the amount of labour which will be required of each person will not exceed three months in the year; so that the weaker brethren and sisters, who may still yearn after the flesh-pots in one form or another, will have time on their hands for securing the gratification of their foolish longings. On the whole, the author seems to incline to the rule in this matter laid down by Cabet for the Icarians, that every article of luxury must be authorised by the people; that the pleasant must always be postponed to the useful; and that no pleasure be allowed which cannot be enjoyed by all: under which régime "Rotten Row will become a thing of the past" (p. 147), and "plum-pudding will be banished for ever from the table of the associated home" (p. 177).

The chapters which treat of the "Waste of Labour" and the arrangements for its reorganisation are full of statistics which would be of interest if they could be relied on. But there are marks of carelessness on the face of them which destroys their value. Thus the average wage of an agricultural labourer is put at from seven shillings to ten shillings a week (p. 76); in the tables of the "domestic class" no indoor male servants are included (p. 100); the number of coal-workers is stated in one place to be 360,000 (p. 127), and in another 246,000 (p. 181); and the number of the "real productive-classes" seems to be sometimes taken at twelve, sometimes at ten millions (pp. 159, 166).

In that part of the book which treats of reconstruction there is, as we have already hinted, nothing new, except perhaps that the communistic State "will publish a universal newspaper, into which every citizen will be allowed to insert his opinion in a concise and intelligible letter or article," which we do not remember to have met with before. To sum up, the true social state will only be reached when all countries are confederated; when the whole people are living in associated homes; when representative government has given place "to legislation

and government directly emanating from the people;" when money has been finally abolished and all property nationalised; when idleness has been declared a crime, and equal distribution of labour and division of produce have been established; when modern armies have been superseded by national armies, in which every able-bodied citizen must be enrolled; and (last but not least) when lawyers have become extinct, and all civil and criminal actions are brought before the popular assemblies, one of which will be established for every 1,000 of the population.

With all its absurdities, however, the book ought to be a useful one, for it reproduces and works out thoughts and aims which are already held and taught by a large portion of the proletariat even in this country. The sooner the upper classes understand that a universal communistic republic, in which property and work shall be equally distributed, is a definite object for which more men are at this moment ready to make sacrifices and run risks than probably for any other, the better it will be for them. It is almost a generation since De Tocqueville asked whether it was likely that democracy which had destroyed feudalism was going to retreat now in fear of the middle classes and the rich, and the giant has made some long strides forward since then. It was only last year that Prince Bismarck said to some of those who were opposing clause 130 of his Penal Code Amendment Bill (enacting penalties on public speech or writing against matrimony or private property):—"Socialism, gentlemen, has made far greater progress than you think. A few years hence you will be yearning for these penal provisions as the solitary traveller in the desert thirsts for a drop of water." Mr. Disraeli hears the demand for physical and material equality rising "like a moaning wind" in Europe. In short, the question of supreme importance to us and our children is, whether ours is or is not a *civilisation usée*, and our time of crisis, in which that civilisation is bound to give place to another and a wholly different one. It would be rash to answer scornfully in the negative because we find many wild and foolish things in the writings and sayings of some of the leading Communists. It is far better to study these with patience, and this book on *Social Architecture* may be useful as showing what the avowed aims of these leaders are at the present time.

T. HUGHES.

The Atonement. The Congregational Union Lecture for 1875. By R. W. Dale, M.A., Birmingham. (London: Hodder & Stoughton, 1875.)

MEMBERS of the Established Church may feel a certain doubt whether, of all its institutions, the Bampton Lecture is the one most deserving the imitation of other Churches. However, the Congregational Union know their own business best: if a "Lecture consisting of a course of Prelections, delivered at the Memorial Hall" (unless it is inconvenient to the lecturer to deliver them), be the best means for "the promotion of Biblical science, and theological and eccle-

siastical literature," everyone will be glad to find these worthy ends so actively promoted; while no one will be surprised at a man of Mr. Dale's eminence being selected as one of the earliest of their official promoters.

Yet there is a difference between the talents of an ecclesiastical organiser, a preacher, and a theologian; and there is a corresponding difference between their functions of which it may be thought that Mr. Dale has an inadequate sense. A preacher addresses his own congregation only, and may legitimately deal only with the forms of thought familiar to them; a theologian professes the pursuit of absolute truth, and when he seems to possess it or to approach it, he is all the more bound to be ready to receive it from any quarter, or contemplate it in any aspect, whether familiar or no. Now, the danger of a theological lecture is that its plan may confuse the aim of the theologian, by forcing on him the method of the preacher; and this danger may be realised in more ways than one. From the tendency to disguise inadequate argument under powerful rhetoric, Mr. Dale is entirely free; it is in another way that he condescends to the level of his audience instead of preserving his own intellectual dignity—by basing his argument on such secondary or fragmentary data as are familiar to them, instead of dealing with works of original and independent power.

The volume may be best described as a reply to a tendency among liberal Evangelicals—while retaining their belief in Christ's divinity, on the one side, and in justification by faith, on the other—to explain away the doctrine of the Atonement, in which the two meet. Now, interesting as it is to learn which are the theological doctrines that have the firmest hold on the religious consciousness of Evangelical Christians exposed to the solvent of liberal thought, it can hardly be expected that the controversy can last long within these limits, nor can a discussion confined within them have a permanent interest. Dr. Bushnell was, and Dr. John Young may be, an able and thoughtful writer; but, even if it were likelier than it is that they would convince the world that divine forgiveness is the same thing as human repentance, they would still fail to convince the world that it is represented as the same thing in the Gospel. Mr. Dale proves very easily and very laboriously, that a doctrine of an Atonement is inseparably ingrained in the New Testament; and that neither the most trenchant criticism nor the laxest theory of inspiration will allow it to be eliminated, but that the truth of some such doctrine must stand or fall with the belief that the New Testament contains any divine revelation whatever. But what the doctrine of the Atonement is he declines to define. In the seventh lecture (without acquaintance, apparently, with Oxenham's *Catholic Doctrine of the Atonement*) he traces very briefly, clearly, and carefully the history of the doctrine, from the Scriptural unsystematised devotion, lasting little beyond the first century, to the later patristic theory of ransom to Satan, rarely put forward after St. Bernard—to the doctrine of satisfaction

for the wrong done to God by sin, lasting from St. Anselm through the scholastic theology—and to the dominant Protestant theory, of vicarious endurance of the punishment of sin. Conceding to his opponents that none of these three theories are thoroughly satisfactory to the conscience or the intellect, he argues truly enough that—"Theologians did not invent the Idea of an objective Atonement, in order to complete the symmetry of their theological theories. They have invented theory after theory, in order to find place for the Idea. . . . The Idea is not the creation of dogmatic theology, nor does it depend upon dogmatic theology for its hold on the heart and faith of the Church."

He reminds us how the Athanasian doctrine of the Trinity has worked itself into the consciousness of Christendom; how the Lutheran doctrine of Justification has worked itself into the consciousness of Protestant Christendom; "but this cannot be said of any doctrine concerning that relation of Christ to the human race which illustrates the theory of the Atonement." But on this relation he has some weighty thoughts, which seem to sum up well the teaching of the New Testament on the subject; the last lecture in the volume, which treats of it, may be said to be a real contribution to theology. But except this, the seventh lecture already referred to, and one or two vigorous protests in favour of the retributive, as opposed to the purely corrective, theory of punishment, the book may be called clever, but hardly valuable.

WILLIAM HENRY SIMCOX.

De Laudibus Legum Angliæ; a Treatise in Commendation of the Laws of England. By Chancellor Sir John Fortescue; with Translation by Francis Gregor, Notes by Andrew Amos, and a Life of the Author by Thomas (Fortescue) Lord Clermont. (Cincinnati, U.S.: Robert Clarke & Co.; London: Lockwood & Co.)

THIS book forms the third of a series of reprints of legal classics issued by Messrs. Clarke and Co., who are the authorised law-publishers of the State of Ohio. It contains nothing that has not previously appeared in print, but there are several reasons why it is not unworthy of notice in these columns. In the first place, it is a republication of a short and intelligible treatise, which is of primary importance for the right understanding of the early growth of our legal institutions and constitutional forms; a treatise often quoted from but seldom read, and of which no edition has appeared in this country for fifty years. And in the second place, it constantly refers to, and partly embodies, a magnificent edition of Fortescue's *Life and Works* which was a few years ago printed for private circulation by Lord Clermont, himself a lineal descendant of the great judge. Of this edition only 120 copies were printed, one of which was generously forwarded to the American publishers for their use in the preparation of this reprint, and another in the library of Lincoln's Inn has been carefully read by me for the purpose of this review. It consists of two royal quarto volumes, the first containing a Life of Sir John Fortescue, and all

of his writings which can now be ascertained to survive; and the second a genealogical history of the Fortescue family from the date of the Conquest to the present time. The general character of that work, its costly plates and illustrations, and perhaps other considerations, may have rendered it necessary that it should be limited to a semi-private circulation; but it is much to be desired that Lord Clermont would consent to the issue of a smaller edition to the public, abridged from his *édition de luxe*. The greater portion of its contents has never before been published, and though it is true that no other of Fortescue's writings can bear comparison with his *Treatise in Commendation of the Laws of England*, yet they are of great value for a proper estimate of the character and learning of the author.

To the American reprint the Life by Lord Clermont has been prefixed, with a small number of pardonable omissions, of which, however, the reader ought somewhere to have been apprised. It is a model of what such a biographical notice should be, composed mainly of extracts from chronicles and other contemporary records, arranged in a most readable manner, and singularly destitute of those impertinent dissertations upon everything connected, however remotely, with their subject, which so often expand biographies into unwieldy volumes. I have only observed one mistake of any importance: on p. xxi. a quotation is backed with the great authority of Selden, which is not to be found in the edition of the *De Laudibus* which Selden published in his own life-time, but only in the much later edition of 1737. That an error lurks somewhere is sufficiently indicated by the fact that the quotation calls Sir Edward Hyde Chancellor to Charles II., a style which Selden could never have used. The Latin text is also taken from the edition by Lord Clermont, which is based upon the earliest MS. known to exist, in the University Library at Cambridge, and the corrupt mediæval spelling is throughout preserved. The English translation is the one published in 1737 by Mr. Gregor, a Cornish gentleman, which Lord Clermont had also adopted; but the American publishers are mistaken when they state that he had "revised" it, for it is nothing more than a verbatim reprint, full of blunders and mistranslations. The notes, again, are a republication, endorsed by Lord Clermont, of those which Mr. Andrew Amos published in 1825, the last occasion on which Fortescue's work has appeared in England. They are extremely copious, and display a large amount of erudition, legal and historical; but they would endure much compression and revision, and it need hardly be said that they are not up to the standard of our critical knowledge at the present day.

Fortescue gave to his treatise the form of a dialogue between himself, as the chief speaker, and the young and ill-fated heir of the exiled House of Lancaster. Its purport is not inadequately expressed by the title, *De Laudibus Legum Angliæ*, but its proper value has suffered somewhat from the misapprehension which would transform it into an authoritative exposition in detail of early constitutional law. It is, in truth, a highly-coloured party pamphlet, written to contrast

the fundamental principles of the common law of England with those of the civil law, as exemplified in France, and with the further object of frustrating the projects of change which Edward IV. was supposed to entertain. It is not, of course, that the writer deliberately misrepresents the state of the law, or falsifies the facts of contemporary history. But with the skill of a practised advocate, and a liberal use of literary artifice, he throws into prominence the more favourable aspect of his case, passing over the notorious circumstances that would tell against himself, and neglecting to point out how frequently his ideal theory of the constitution was violated with impunity, during that turbulent epoch in which he lived. This consideration, however, does not affect the truth of the two main doctrines which he undertakes to instil into his royal pupil, which form the bulwarks of the old Whig theory of the constitution; that the king of England is a "*rex politice regens*"—a limited monarch, who can neither impose taxes, nor make laws without the assent of Parliament; and that trial by jury, which in his time was fully developed into its modern form, is the safeguard of the liberties of the subject. To these two positions he opposes the theory of the civilians "*quod principi placuit, legis habet vigorem*," and the mode of trial "*per testes*," which the French have also borrowed from the Roman law. On these two issues he has no difficulty in making out his case, and, indeed, wins so easy a victory over his imaginary opponent that the reader can hardly avoid suspecting him of unfairness. The book is, therefore, a political essay rather than an exposition of English jurisprudence. It must, however, be reckoned a fortunate circumstance for the preservation of our constitutional liberties, that the elastic rules of common law permitted the popular lawyers of the Stuart period to quote from it passages supporting their own liberal views, which were held almost to have the authority of judicial precedents. Apart from its admitted value as a treasury of constitutional principles, this little work of Fortescue deserves a careful perusal on other grounds. Its author was not only the first lawyer of his time, but a man of general culture, and a practised political writer. He was sprung from a distinguished family in the West of England, and is said to have been educated at the University of Oxford before he came up to the Inns of Court. His Latin is, no doubt, somewhat barbarous, but his literary style is elegant, and even occasionally witty, while the arrangement of his matter is admirable. The references which he delights to make to Thomas Aquinas, and at second hand to Aristotle, are appropriate and pointed, and are not more than sufficient to give a colouring of scholasticism to all his arguments. On the other hand, he has kept his subject entirely free from the intricacies of black-letter law, so that no student who is familiar with the phraseology of our legal system as it stood at the beginning of this century, need be afraid to encounter any difficulty. His pages are interspersed with most interesting allusions to the social condition and manners of his time; and he concludes with a unique

description of the schools of law then existing in London, which represents them as fully developed in all their essentials, and not materially different from what they still continue to be.

As to the character of the English translation, it is impossible to speak with approval. It is marked, indeed, by that freshness and idiomatic flavour which might be expected from a cultivated gentleman of the last century, and which it appears hopeless for our modern writers to imitate; but it is rarely a faithful rendering of the original, and gives a most inadequate representation of the forcible turns of expression in Fortescue's Latin. Its worst fault is that with singular infelicity it goes out of the way to paraphrase the more important statements of law with which Fortescue illustrates his arguments, and habitually leaves an erroneous impression upon the mind of one who does not take the trouble to consult the original. For example, in the celebrated passage in cap. 5, where Fortescue incidentally informs us of the legal rule in his day touching the exclusion of the half-blood from the inheritance, the translation absolutely inverts the sense of the original; and similarly, in cap. 26, the entire purport of the "*writ of attain*," to review the verdict of a jury, is misrepresented by the gratuitous insertion of the words "*contrary to evidence*." In these and other passages where Mr. Gregor goes wrong, the old translation by Mulcaster, which Selden did not disdain to edit, is baldly correct. A new edition of this book with modern notes is badly wanted in this country; and it is possible that a collation of these two translations might be so managed as to maintain the merits of each, and vindicate the credit of England in amicable rivalry with the publishers of a provincial town in the United States, who, in producing the reprint which has given occasion to these remarks, have performed with enterprise and good taste all that properly came within a publisher's province.

JAS. S. COTTON.

NEW NOVELS.

A Dog and his Shadow. By R. E. Francillon. (London: Grant & Co., 1876.)

Thornwell Abbas. By Grant Lloyd. (London: Sampson Low & Co., 1876.)

French Pictures in English Chalk. By the Author of "*The Member for Paris*." (London: Smith, Elder & Co., 1876.)

Jan of the Windmill. By Mrs. J. H. Ewing. (London: George Bell & Sons, 1876.)

A Dog and his Shadow is a very clever and original story. Mr. Francillon has introduced that favourite character the untaught peasant poet, but he has drawn the seamy side of the prodigy. Abel Herrick is a foundling, picked up in the dreariest of Cambridgeshire villages, who teaches himself to make much better verses than most that are published between decorative covers. To the "*dreaminess*" which is generally made a rather amiable trait in the poetic character he adds an extraordinary selfishness, which is the cause of

most of the complications of the story, and of the misery of the persons. And here a rather painful question in the rule of three arises. If a poet who, when a little boy, broke a cup and tried to throw the blame on a little girl, ends by suborning false evidence, making love to two young ladies at once, and attempting suicide, what will be the end of a young lady who strangled canary birds when in the nursery? As sporting writers say, we "*get a line*" through Abel Herrick to the future performances of Gwendolin Harleth. It is rather odd that Mr. Francillon has almost anticipated Gwendolin's scene with Klesmer. His heroine, Beatrice Deane, a very disagreeable example of the intellectual young lady of the period, loses her fortune, and consults Signor Fasolla as to her chances of success on the stage. "*You said I was a second Grisi, Signor Fasolla.*" "*Yes, mademoiselle—as an amateur.*" More practical advice than Klesmer's follows:—"If you could play the bassoon, that would be something; it would pay to be the only young lady who plays the bassoon. There would be twenty more by the end of the season, but you would make your fortune by then." It may, perhaps, be objected to *A Dog and his Shadow* that we see too little of the good hero, who was also an excellent cricketer, and of the successful heroine. The not-so-good characters, however, are much more interesting, and, indeed, it might be an improvement if the first young man and woman, the patient loving girl, the heavy excellent man, of fiction, could be represented by mathematical symbols. Thus "*A rescues B from villain;*" "*B renounces improper poet, accepts C;*" would do admirably instead of whole chapters of necessary commonplace. Mr. Francillon gives us as little commonplace as possible, and his country attorney even is an unusually fresh and spiritedly offensive specimen of his class.

Miss Veronica Kinnaird, in *Thornwell Abbas*, was a disagreeable member of a large family. She had a way of prophesying evil things to young brides; and as she was gifted with second sight, the evil things came true. Therefore when she told her niece, young Lady Grizel, just before her wedding, that her grandson would come to grief "*by the burn in the mead at St. Joseph's Thorn*," it was perhaps natural that Lady Grizel, some forty years later, should change her grandson at nurse. But "*no man may deal with his shapen fate*," and no grandmother either, and *Thornwell Abbas* tells how the changeling did get thrown from his horse by "*the little brook which ran from St. Joseph's Well among the grasses and ivy-clad roots of the Chase*." Lady Grizel was obliged to explain that "*she thought to save him from the curse, and to day it has alighted on him*." It is rather a bold experiment to introduce this well-worn sort of incident into a story of the most modern character, and it may be doubted whether the supernatural element in the tale gains gloom, or the everyday and chatty element lightness and grace, from the abrupt contrast. Next to the romance of second sight, a very adequate picture of Commemoration at Oxford is the

most interesting part of what, on the whole, is a clever and readable novel.

French Pictures in English Chalk is a collection of the delightful stories of French life which appear now and then in the *Cornhill Magazine*. There are no short tales in contemporary literature which come at all near these in wit, observation, grace and ease of style, and skill in construction. Every intelligent reader of fiction knows the "Rough, Red Candidate" and "Une Pétroulette" already, and will be glad to meet them and their companions again. It is not easy to make out the political views, if he has any, of the writer of *French Pictures*. Imperialists, Legitimists, Communists, if they fight well, he treats *nullo discrimine*, and is only severe on M. Buche, the censor of plays, and on M. Jobus, the eponymous hero of permanent officialism. Here is a description of the attitude which a private person would take in a revolution if he wished to imitate the conduct of our dear country in time of war:—

"All I had to do was to take a sheet of paper and write a feeling dispatch to the Citizen Bilis, reminding him that this was the nineteenth century; that we were in a civilised age; that it was perhaps a pity to molest one's neighbour; but that any how, if he thought otherwise, and persisted in assaulting the Curé Tricoche, plundering his church, and finally hanging him to a lamp-post, he might count upon my strictest neutrality. . . . By-and-by, when M. Tricoche was hanged, the church gutted, and the Citizen Bilis loaded with spoil, I might have appeared on the stage in character of mediator, made some more allusions to the nineteenth century, paid some new compliments to civilisation, and proposed to M. Bilis to surrender part of his lootings. On his refusal I should have begged him to believe that my esteem for him remained unaltered, and expressed a hope that the amiable relations between us would continue serene till the end of time."

Jan of the Windmill is a delightful story for children and older people. Mrs. Ewing does not make the mistake of supposing that children are idiots. She neither writes down to their supposed imbecility, nor grins through a horse-collar and burlesques things old, and alludes to the petty interests of politicians; nor does she stuff her work with texts and morals. Her characters are drawn carefully and strongly, and she does not keep explaining everything, like most writers for the young. The atmosphere of country life—"the very air about the door made dusty with the floating meal"—breathes freshly in the book, and the rural scenes are not unworthy of George Sand, if George Sand had written *pour les petites filles*. The growth of the hero's artistic power is as interesting as the old lives of old painters, and we have only one fault to find with the work. It is the third story, out of this batch of four, in which there is doubt and mystery about the parentage of the children. Now, since society emerged from the Thibetan stage of the family, ignorance on this important point is not so common—not common in the ratio of three to one. One could stand it in *The Dog and his Shadow*; it grew tiresome in *Thornwell Abbas*; in *Jan* it becomes a kind of nightmare.

Οὐ γὰρ πῶς τις εἶναι γόνον αὐτοῦ ἀνέγνω seems to be the novelist's motto. No one is obliged, however, to read the three tales we

have reviewed together, and perhaps next week the family of fiction will have reached some more civilised stage of development.

A. LANG.

RECENT VERSE.

Poems. By Thomas White, Jun. (Oxford and London: James Parker and Co.) Most poets have to confess with sadness that their performance falls far below their aspirations; the ideal is still unattained and unattainable. And while we by no means wish it to be understood that we share Mr. White's opinion that he deserves the name of poet, we are bound to admit that he, too, falls short of his desires and intentions. He has had, as he tells us, his "Day Dreams," in which a lady came to him—presumably the Muse herself—called him "darling" and "dearest," told him all that she had done for him, and all that she wished he should do for her.

"I it was that fed thee
With celestial food;
I that smote the passion
Through thy burning blood.

Dearest, and I freed thee
From the tyrant schools,
From their pedant jargon
And their sordid rules."—(P. 3.)

It is, indeed, quite true that this was done either by the lady or by something else, for Mr. White, being, as he tells us, an Oxford man, is by no means bound by the received rules of the studies usually pursued there. Thus he presents us with the plural "Cyclopes" (p. 15), and supposes "Cythera" to have been the name of the goddess of Love (p. 93). It is true that Anacreon uses the form, but we venture nevertheless to think it in this case a simple blunder for Cytherea. He appears to say that Catullus as well as Anacreon wrote in Greek (p. 95), and found that he read far more rapidly when he "cut old Growler's lecture" (p. 78). But, in spite of this freedom, and the commission to

"Sing me songs for England,
Songs of purpose high,
Passionate and simple,
Pealing to the sky," &c.,

he has written a quantity of mediocre verse, in which all that has any pretence in it of goodness is simple imitation, and all that is original is extreme trash.

Poems. By Edmond G. A. Holmes, St. John's College, Oxford. (Henry S. King and Co.) Mr. Holmes is a poet of quite another stamp. Without being very strong, and in spite of the great, even excessive, influence that the manner rather than the matter of certain other writers has had over him, he is always interesting and generally original. His verses represent adequately one side, and that one of the best sides, of Oxford thought—a philosophy coloured and softened by a vein of deep religious feeling, a religion vague and tentative, yet always manly and candid. The author's mind seems eminently receptive and eclectic in the best sense, and this is curiously reflected in the metres he chooses for his poems. If he writes in a meditatively religious mood he falls, as it would seem unconsciously, into the rhythm invented, or at least adapted, by Mr. Myers for his *St. Paul*; if he becomes more philosophic, yet clinging to a creed which seems for the time definite, he adopts the metre of Browning's "Rabbi Ben Ezra;" in another poem—"The Message"—which gathers up into expression so much that stirs vaguely in the modern Oxford mind, he takes an exquisite measure which in its precise form we have only met once before, in a prize poem of Bishop Alexander's on the installation of Lord Derby as Chancellor. We must quote a few stanzas from "The Message," though a certain difficulty of selection arises from the want of compression, and the somewhat excessive length, for the subject, of nearly all the poems. The thought and the

descriptions, always graceful, sometimes extremely beautiful, are beaten out rather thin. Mr. Holmes traces the wanderings of the Thames, or Isis, in its higher course

"Into that valley, in whose bosom sleep
Grey tower, and mouldering wall, and climbing
spire,

And court, and grove, and cloister nestling deep,
While lingering with desire,

Or hushed in reverence thy waters move,
Softly and noiselessly—so sweet the spell
Of peace and beauty, and unuttered love,
How sweet my heart knows well.

And all thy after course

Each humble hamlet church, each red-roofed to wn,
Each little inn, nestling in quiet shade,
Each old ancestral mansion looking down
Through lawn and wooded glade.

I know the season when thy hanging woods
Are glorious with rich autumnal hues,
Set mid dark pines that know no changing mood,
Whose leaf no season strews."

These lines will give some idea of Mr. Holmes's descriptive faculty; the more thoughtful parts of the poem have no one or two stanzas sufficiently condensed for extraction. Three stanzas, however, from another poem, "What think ye of Christ?" will show how he can conduct an argument within the limits set him by metre, and with these we must close our extracts, and refer our readers to the volume itself.

"Yes, Thou art God, I know—

Ah! if it were not so

Life would be void and meaningless and dark:
Quench every phantom light

Born of abyssmal night,

Leave, only leave, this one divine spark.

Ah! but I hear them say:

Prove first before you pray—

Prove that this man is God, living though dead.

I answer, Who will prove

That men breathe, think, and love—

Prove that the golden sun shines brightly overhead?

But that the Christ who trod

Our earth was one with God,

Is that so definite, minute a fact

That on one narrow deed

Man rests his holiest creed,

Or builds his hopes of Heaven on one recorded act?"

The Wonders of Creation, and other Poems. By Matthew Josephs. (F. E. Longley, 39 Warwick Lane, E.C.) Mr. Matthew Josephs is a negro schoolmaster, of royal lineage, as he tells us in his preface; his father being the eldest son of Agullon, a prince of one of the Eboe tribes, "who had been a general in his own land before he was stolen from thence." From his father's mother Mr. Josephs "received some information respecting the customs and manners of her country, Dahomey." This old lady's reminiscences might have been entertaining had they been presented to us by her grandson in place of verses on subjects far beyond him. The most that can be said for them is that some of the "sacred poems" are not much below the level of Brady and Tate; as—

"When from Egyptian bondage came

That mighty host at Heaven's command,

The sea with reverence heard His name,

And quickly fled its wonted strand.

Before them went that sacred sign,

By day, to screen them from the heat;

By night, a light—oh! wise design—

To cheer them in their lone retreat."—(P. 149.)

Village Verses, &c. By Guy Roslyn. (Moxon and Co.) These verses have been reprinted from various periodicals, none of them, however, being such as are distinguished by literary excellence. The lyrical poems are below mediocrity, and were probably only accepted or demanded by editors to fill a corner for which there was no other available copy. In their reprinted form they serve no such useful purpose, and only will

not be forgotten because they will probably never attract the smallest notice.

Caesar in Egypt, Costanza, and other Poems. By Joseph Ellis. (Pickering.) The publisher has done all he could to render this volume attractive: admirable type, good paper, wide margins, untrimmed edges—all things in which the book-lover's soul delights are here. A fair outside, but the informing soul is wanting. The following is certainly an average specimen of what is called a poem. Cleopatra speaks to Caesar:—

"Caius! I have a thought to let thee see
Oasis Ammon. 'Midst the desert sands
An Island rises fresh and flourishing . .

Thou wilt on Camel speed, and I the same—
'Ship of the desert' some time aptly styled;
We shall have retinue to keep us blithe
And after joy that novelty shall yield,
Regain the Barque, and float where we would go.
Dear Caius! This a timely thought, I ween,
Born to prolong our friendship."

"Cleopatra!

I much approve thy gay alluring scheme."—(P. 77.)
There are also a number of poems in modifications of a metre well known to our childhood, as

"A younker with his younker friend
A ramble goeth far away
Throughout a sweltering summer day
For ever."—(P. 221.)

Confer, si vis,

"Who ran to catch me when I fell,
And kissed the place to make it well?
My mother."

Even of the smaller lyrics and sonnets there is not one to praise, a thing somewhat unusual in a volume of this size written by one who is not ignorant of the laws of verse, and is not uneducated.

Poetical Débris. By George Messenger. (Ward, Lock and Tyler.) *Débris* = rubbish. We are unable to suggest any other epithet than that which Mr. Messenger has given to his own work.

Miscellaneous Poems. By Francis M'Dean, B.A. T.C.D. (Dublin: E. Ponsonby.) So, too, we wholly accept this author's own description of his verses when he speaks of them as "these trifling effusions."

Thoughts and Memories in Verse. By G. C. B. (Brighton: Thomas Page.) When "in deference to the opinion and desire of friends" an author "ventures to submit," &c., &c., we may generally take it for granted that in themselves the poems submitted are worth little. These verses are for the most part religious, well-intentioned, and the work of an educated man. But there all praise must end; they are quite without true poetic fire.

Masterpieces of German Poetry. Translated in the Measure of the Originals. By F. H. Hedley. (Trübner and Co.) This book seems to us a misnomer, though after all the question what is a Masterpiece must ever be decided by each German scholar for himself. Schiller's "Lay of the Bell," two somewhat less known of Goethe's poems, "Die Wallfahrt nach Kevlaar" of Heine, are all that are taken from the three great masters of German song, and these are not to our mind well translated.

Translations from the German Poets of the Eighteenth and Nineteenth Centuries. By Alice Lucas. (Henry S. King and Co.) These are well selected, and, as a rule, carefully translated in the original metres. The volume is pleasing and readable by those even who do not know German; those who do will be, as by most volumes of translations, now satisfied, now irritated.

"I sing as sings the bird whose home
Is in the air so free,"
is not the translation of Goethe's

"Ich singe wie der Vogel singt
Der in den Zweige wohnt;"

while, on the other hand, the lovely lyric "Das

Veilchen," by the same poet, has lost scarce any of its fragrance in translation. Miss or Mrs. Lucas is also very successful in some of the translations from Heine, but she has not attempted any of the more difficult "Lieder." She has kept well within her powers and deserves praise.

Love's Trilogy. By Thomas Sinclair, M.A. (Trübner and Co.) We confess that we cannot understand any single page or stanza in Mr. Sinclair's volume, nor can we catch even the faintest indication of what is the meaning of the collective whole. If we could understand them we might say that there are some sonorous words here and there building themselves into fine lines; but at present the whole seems to us like some embroidered stuff seen upon the wrong side, and the brain fails in the attempt to trace arrangement, connexion, or leading idea.

The Regent; A Play. By J. M. Chanson. (Samuel Tinsley.) There is no reason why this sad trash should have been printed, and every reason why it should not have been published. The author presumably puts out his greatest strength at his most thrilling scene, Darnley's murder, which is given thus:—

"Darnley. O roynish traitors! What is it ye seek?
Balfour. O hiding king! thy life.
Darnley. Draw, Standen!—Help!—
They take my life!—
O coystrel cowards!—Treason! Treason!
—Oh! [Exeunt.]

John and Eva: A Tale of Lower Dereham. By Francis Hughes. (Chatto and Windus.) How John Bevan, a country "doctor of repute,"

"Of noble lofty mien,
Of moderate size and of athletic build,"
wooded and married Eva Grey, of Knole Grange House, is here done into verse. It is very oddly constructed verse, being as a rule blank, but the three last lines of each paragraph rhyme in triplets. The whole thing is very poor and bald, though little is absolutely bad except a song, which the author, differing from us, calls

"The pretty little song they all so liked,
'The Skylark on the Wing,'"

of which these are two stanzas:—

"When day is on the break,
From out the corn I spring,
And then I love to soar above
Melodiously to sing.

"I climb up tow'ards the clouds,
While still it's almost dark,
And there I stay nigh all the day,
A very happy lark."

Sunflowers: A Book of Verses. By Herbert Gardner. (Henry S. King and Co.) Mr. Gardner has some command of poetic expression and a good deal of poetic feeling, but he is sometimes obscure and frequently imitative. We have, for instance, had this sort of thing very often. It is in a poem called "The Last Kiss."

"Only a moment of madness!
Marriage of pleasure and pain,
Gleam of an infinite gladness,
Storm-cloud and sunshine and rain,
Blurred by the mists of our sadness
Again."

In a play called "Leone," which occupies more than half the volume, the blank verse is good and the action vigorous. It deals with a difficult and dangerous subject, the schemes of a prince against a girl who turns out to be his daughter; but, though the author skates on thin ice, the play is pure, and the tragedy, for such it is, is not at all the terrible one of *The Cenci*.

Key Notes. By Arbor Leigh. (Norwood: Thomas Scott.) Arbor Leigh has here written twenty-three pages of very remarkable verse, which Mr. Thomas Scott has published as one of a series of pamphlets which he devotes to the propagation of Free Thought as understood by him. Arbor Leigh has much yet to learn about form and grace of expression, but there is

great poetic and profound thought in this little tract. The following lines are very striking:—

"I do not trust the unreflective praise
That would appropriate the fair 'must be'
As man's especial heaven-sent heritage.
For he who calls the glory of this world
His own, his right, his message from a God
Intent on beautifying life for man,
Will find his logic sadly overcast,
And all his music stricken out of tune,
When he, perchance, shall find his own delight
Hangs on that fact that strikes a brother dead."

—(P. 20.)

At times, however, especially in "A Summer Song," the form, as well as the thought, is beautiful; and we hope to hear more of "Arbor Leigh."

Lost Footsteps. Poems by Walter Sweetman, B.A. (Edinburgh Publishing Company.) Mr. Sweetman has written two plays, of which the scene and time are the world before the flood. He is a Roman Catholic, and the present work is the last of a series of tales and poems in which he has endeavoured to put forward a system of Christian philosophy. He wants to help the masses of men to keep faith, and thinks that those who will not read theological essays will read verse; hence this book. We, on the contrary, think that the masses of men have a good deal of common sense, which will keep them from reading anything so thoroughly weak as this volume, so wanting in every character of true poetry. One thing Mr. Sweetman has done which must have been difficult. He has produced the very worst translation or paraphrase which it has ever been our misfortune to see of the hymn "Stabat Mater dolorosa."

NOTES AND NEWS.

LORD GEORGE CAMPBELL has in the press a volume of letters sent home from the *Challenger*, giving a popular account of some of the various incidents of her famous voyage. This volume, under the title of *A Midshipman's Cruise in the Challenger*, will be published in the autumn by Messrs. Macmillan and Co.

MR. HENRY BLACKBURN has in preparation a series of Illustrated Handbooks to the National Collections of Pictures, Sculptures, &c., uniform with *Academy Notes*. The first part will contain sketches of some of the principal pictures in the National Gallery, and will be published by Messrs. Chatto and Windus.

MESSRS. REMINGTON AND Co. will shortly publish *Within Bohemia: or, Love in London* (after Balzac); seven stories in one volume, from the pen of Mr. Henry Curwen, author of *Sorrow and Song*.

MR. S. R. TOWNSHEND MAYER has resigned the editorship of the *St. James's Magazine*.

WE are glad to have to find no such fault with Mr. Elliot Stock's Facsimile Reprint of the First Edition of George Herbert's *Temple* as we found with his *Pilgrim's Progress*. The work is in all respects creditable. It appears from Mr. Grosart's Introduction, which is happily short, that there were no less than three issues of the poem in 1633—one undated, which Nicholas Ferrar would seem to have printed "for immediate friends," and two dated. Facsimiles of all three titlepages are given. Of the undated copies only a single exemplar is at present known, which is in the possession of Mr. Henry Huth. The three editions are identical, except as to their titlepages.

MESSRS. HARDWICKE AND BOGUE will publish by subscription a work on *The Antiquity of the Likeness of Our Blessed Lord*, illustrated with twelve photographs, coloured as facsimiles, and fifty engravings on wood, from original frescoes, mosaics, paterae, and other works of art of the first six centuries, by the late Thomas Heaphy. The price will be three guineas to subscribers.

THE Religious Tract Society have in preparation for early publication:—An illustrated work on America, by the Rev. Dr. Manning; *Jewish Life in the Time of Our Lord*, by the Rev. Dr. Ederahaim; a *Commentary on Ruth*, by the Rev. Samuel Cox; a volume of *Sermons*, by Canon Garbett; and *Life in the Southern Isles: a Record of Twenty-two Years' Residence*, by the Rev. W. Wyatt Gill. Dr. Green, author of *The Handbook to the Grammar of the Greek Testament*, &c., has been appointed one of the editors of the Society.

Mrs. ELLEN EPPS, widow of the late Dr. John Epps, the homoeopathic physician, died on July 6, aged about sixty-six, having been in precarious health for some years past. This lady, who was regarded with great affection and respect by a wide circle of friends, was a novelist and biographer: having published several years ago a novel that excited some attention, *Labour and Love*, followed by one or two others, and more recently a memoir of her late husband.

Messrs. LONGMANS have just published vol. iii. of the English translation of Comte's *System of Positive Philosophy*. We purpose to withhold our notice of the whole work until the issue of the fourth and concluding volume, which, we understand, will not now be long delayed. The present volume is entitled *Social Dynamics*, by which term is to be understood the historical proof and practical illustration of the Positivist theory of Sociology; and it is generally admitted that Comte's strength chiefly lay in the philosophy of general history. A considerable portion of the translation, and all the editorial labour, has been undertaken by Prof. E. S. Beesly; but certain chapters have been translated by Mr. S. Lobb, Mrs. Hertz, Dr. J. H. Bridges, and Messrs. Vernon and Godfrey Lushington. Mr. Lobb, we regret to say, has died before the publication of the book; and this opportunity ought not to pass without a tribute of respect to the memory of one whose contributions to literature were not well known in this country, but who wore out his life in hard work in the Educational Department of Bengal.

THREE recent publications of texts deserve the attention of theological students. The first is a new edition of Tischendorf's *Evangelia Apocrypha*, revised and brought up to the present time by the distinguished editor himself. The Prolegomena, unfortunately, remain as they were, but as they certainly would not have remained, had Dr. Tischendorf lived a few weeks longer; but Dr. Wilbrandt has given as much information respecting new critical authorities as could be expected. The second is the first fasciculus of the long-expected revision of Dressel's *Apostolical Fathers*. The commentary marks a distinct advance upon Dressel's; the text, carefully revised as it is, will require a still further revision on account of the recent discovery of a MS. of the Epistles of Clement at Constantinople. It is stated, indeed, that a new text of the Epistles of Clement is already being prepared by the joint-editors of the work, Drs. von Gebhardt and Harnack. The third is the first part of the first volume of Ceriani's photolithographic reproduction of the famous Ambrosian MS. of the Peshitto version of the Old Testament, containing the Pentateuch and Job i.-xxiv.

Messrs. NIEMEYER, of Halle, have published the first of a series of works to be edited by an Italian and German editor conjointly, entitled *Comunicazioni dalle biblioteche di Roma e da altre biblioteche per lo studio delle lingue e della letteratura romanza*. The first volume is the *Canzoniere portoghese*, from the Vatican Library. It is a collection of the songs of the earliest period of Portuguese literature, concerned mostly with the legendary King Denis and his court. The work contains 1,100 of these songs, of which only 100 have been published before.

THE Augsburg *Allgemeine Zeitung* contains in Nos. 179-181 the concluding article by the Baron

A. de Reumont on Dr. Doran's *Mann and Manners at the Court of Florence*, which completes the sketch of Florentine society by passing under review the reign of Grand Duke Peter Leopold to the death of Sir Horace Mann, which occurred in 1786, four years before the Grand Duke became German Emperor. Like the two first articles, the present one makes use of many other materials besides the extracts from Sir Horace's letters, which grow more and more scanty and unsatisfactory, while on the contrary the history of Tuscany under an active and able sovereign grows infinitely more interesting. M. Alfred von Arneth's publications, the private correspondence of Maria Theresa, Joseph II., and Leopold, throw much light on Tuscan affairs, and should have been consulted by Dr. Doran. The article likewise contains some details of Earl Cowper's long sojourn in Florence—which, in fact, became his home—and on his connexion with the literature and art of the country. To him was dedicated the first complete edition of Macchiavelli's works, begun in 1782, and he was the chief contributor to the monument in Santa Croce, erected in 1787. There exists in Florence a fine portrait of him, painted in 1769 by Raphael Mengs, and presented by him to his friend the Marchese Carlo Rinuccini; in the inscription he is called "Cowperus—inter Magnae Britanniae proceres—nunc Sacri Romani Imperii princeps." Goethe's Life of Philipp Hackert, the landscape and marine painter, frequently mentions Charles Gore, Lady Cowper's father, Richard Payne Knight's companion in his Sicilian tour, who died at Weimar in 1807, leaving his collection of drawings to the Duke's library. A postscript to M. de Reumont's article speaks of the house on the Arno which Mann occupied during the first years of his residence in Florence, and where Horace Walpole and Gray were his guests, Casa Ambrogi in the Via de' Bardi, lately demolished to make room for the new quay between Ponte Vecchio and Ponte alle Grazie, on the left bank of the river. The notice was communicated to the author by John Temple Leader, Esq., who has been for many years an inhabitant of the Tuscan capital, of which he has collected many memorials. Mr. Leader discovered in the parish register of Sta Felicità the following entry:—"1740. In casa Ambrogi l'Inviato Inglese Eretico Orazio Mann a. [anni] 36," and in 1742 another entry, mentioning Mr. Chute and others living in the same house, with crosses before their names. Mann took Casa Manetti in Borgo San Frediano, where he continued to reside until his death, in the autumn of 1740, for 120 scudi a year! According to the above-mentioned entry, he was, when he died, eighty-two, not eighty-five as Walpole fancied.

THE *Rivista Internazionale* maintains a high literary standard. The last two numbers have contained two interesting articles on George Sand, and an appreciative sketch, by Herr Scartazzini, of the life and labours of Leopold von Ranke. The number for July gives a specimen of a work on criticism by Signor E. Lombardi of Bergamo. The book itself, which is to treat of Italian literature generally, is at present going through the press. The chapter printed in the *Rivista* is the one which deals with Boccaccio, who has lately been a subject of dispute between German and Italian critics. Signor Lombardi approaches criticism from the philosophic rather than the literary side. He wishes to show the scientific development of the national thought, and to trace the influence of the scientific contents of thought in its artistic form. We shall await with some curiosity the appearance of his book. The experiment is certainly a bold one.

THE July number of the *Theologisch Tijdschrift* contains a review of Mr. McClellan's translation, &c., of the Gospels; controversial articles by Drs. Pierson and Kuenen on a positivistic work of edification by the former; and notices of Vol. iv. of the *Speaker's Commentary*, and of a thesis by M. Rivier on the Biblical tradition of the Deluge,

by Prof. Kuenen. The *Theological Review* for July also numbers Prof. Kuenen among its contributors. His object is, by means of Old Testament passages, to test the truth of the statement that Israel gradually rose from the worship of a single god to that of the only God; or, in other words, that Yahveh, from one of many gods, gradually became to his worshippers the one true God.

THE modern history of Norwich and its Parliamentary representatives has formed the subject of much close enquiry of late, and many curious facts have been elicited regarding the relations, chiefly of a pecuniary character, which have in recent times subsisted between member and constituents. The following letter, copied from the original in the British Museum, illustrates the same subject at an earlier period, when the pecuniary relations were of quite an opposite nature, and has on that account a wider interest as a contribution to the scanty materials in print concerning the old custom of paying members of Parliament for their services as legislators:—

"Laus Deo London the 21 No: 1650.

"Right Worshipp! my due respects remembred unto you & all your Bretheren, & it is now full five yeares this November, that I have satt in Parliament by your election, & as yett I have onely received from the City one hundred pounds, I was very senceable of the burthen, & I did use all meanes I could possible to have avoided it, knowing it would take me of from followeing my imployments I were then in, & also hinder me in any further way of livelihood, which I find by sad experiance, to my neare undoeing, not expecting such disrespects from a City, that I must say, deserved better from you all, it is forgotten how I stood for your priviledges, in opposing the Lord Matravers & his Father, when your whole City (except 2 Aldermen besides myself) did submit unto them, nere to my undoeing, except the Lord had wonderfully upheld me, Blessed be his name therefore, it cost me no small some of money, you have all fared the better for it, for those great men were ashamed ever to come at Norwich after I had given them that foyle, & am I thus requited, & delt withall so, as never any of your Burgesses, my predecessors were before, will you force me to move the house in it & by that meanes force you to pay it, as the Burgesses of Lin did, & by that meanes receive it to this day, the Towne of Yarmouth payeth their Burgesse, & London payeth also without askeing for it, I expect it from you as a due, & not as a guift, I pray you therefore acquaint your Bretheren & Common Counsell with this my letter, & I desier to receive your answer; I have not bene wanting to do my duty in my place, & I [am] most willing to resigne it to any other [that] may deserve better from you; & in the [mean] time I shall rest

"Your worships [to]
"command

"Tho: Atkin

"To the Right worships"

"Mathew Linsey Esq"

"Maioir of Norwich

"p'sent

"in

"Norwich"

THE Rev. W. Esdaile writes:—

"I read a notice in your paper of July 1 of my mother Mrs. Esdaile's death. With respect to the last sentence of that notice, if your correspondent means to assert that Mrs. Esdaile took no interest in the history of her father, the poet, and felt no admiration for his poetry, I wish distinctly to deny the truth of that assertion."

THE following Parliamentary Papers have lately been published:—Sixth Annual Report of the Deputy Master of the Mint, 1875 (price 3½d.); Reports of H.M. Consuls on the Manufactures, &c., of their Consular Districts, Part III. (price 1s. 6d.); Annual Report of H.M. Inspector of Explosives (price 3½d.); Report of Sir John Hawkshaw on the Purification of the Clyde, Minutes of Evidence, &c.; Report of Select Committee on Toll Bridges, River Thames (price 1s. 1d.); Report from the Select Committee on Ecclesiastical Dilapidations Act (price 3d.); Report of the Comptroller and Auditor-General

upon the Account of the Commissioners of Church Temporalities in Ireland (price 4d.); Returns relating to Areas, Inhabited Houses, and Male Population of the United Kingdom, 1871 (price 3s. 4d.); Return of Railway Accidents in January, February, and March, 1876 (price 1s.); Return of Superannuation Allowances in Public Offices (price 11d.); Fortieth Report of the Inspectors of Prisons of Great Britain, II., Northern District (price 2s.); Reports of the Medical Officer of the Privy Council on Public Health, New Series, No. 7 (price 1s. 4d.); Return of Home Accounts of the Government of India (price 9d.); Reports of H.M. Secretaries of Embassy and Legation on Manufactures, Commerce, &c., Part II. (price 8s. 4d.); Further Correspondence relating to the Indian Tariff Act of 1875 (price 6d.); Finance and Revenue Accounts of the Government of India for 1874-75 (1s. 9d.); Reports of the Inspectors of Mines for 1875, with Plates, &c. (price 10s.); Report of the Committee of Council on Education, England and Wales (price 2d.); ditto, Scotland (price 1d.); Return relating to County and Borough Prisons (price 1s. 5d.); Report of the Commission on Fugitive Slaves, and Minutes of the Evidence (price 1s. 8d.); Report of Cambridge University Syndicate appointed to consider the Requirements of the University in different Departments of Study (price 6d.); Reports on the Sugar Industry in Foreign Countries (price 4d.); Report of Committee on Ecclesiastical Dilapidations Acts (price 2s. 6d.); Report of Select Committee of the House of Lords on Ecclesiastical Offices and Fees Bill, with Minutes of Evidence, &c. (price 3s. 6d.).

We have received *Rain and Rivers*, by Colonel George Greenwood, third edition (Longmans); *Characteristics of Christian Morality*, by the Rev. I. Gregory Smith, second edition (Parker); *A Centennial Commissioner in Europe, 1875-76*, by John W. Forney (Lippincott); *Modern Spiritualism*, by J. N. Maskelyne (Warne); *The Spelling-Bee Manual*, by T. Edmondson (Routledge); *Rum Rhymes*, by W. A. Chandler (C. R. Brown); *Little Folks: a Magazine for the Young*, new and enlarged series (Cassell); *A Course of Practical Chemistry*, by Prof. W. Odling, fifth edition (Longmans); *Mr. Lockyer's Logic*, by William Carpenter (published by the author); *Foster's Decision of Character, and Other Essays*, Friendly Counsel Series (Ward, Lock and Tyler); *Central India in 1857*, by Henry Durand (Ridgway); *Easy Lessons: or, Self-Instruction in Irish*, by the Rev. Ulick J. Bourke, sixth edition (Dublin: McGlashan and Gill); *Gina's Baby*, by Edward Jenkins, M.P., thirty-sixth edition (Strahan); *By the Sea*, by Katherine S. Macquoid, new edition (Smith, Elder and Co.); *The Childhood and Schoolroom Hours of Royal Children*, by Julia Luard, new edition (Groombridge); *Leaves from my Autobiography*, by the Rev. Charles Rogers (Grampian Club); *The Ancient Régime*, by H. A. Taine, trans. John Durand (Daldy, Isbister and Co.); *Civilised Christianity*, second edition (Trübner).

OBITUARY.

MALDEN, Henry, at Hampstead, July 4, aged 76. [For 45 years Professor of Greek in University College, London; author of *Origin of Universities and Academical Degrees*, 1836.]

NOTES OF TRAVEL.

THE Norwegian Atlantic Expedition left Bergen on June 1 for the Sognefiord, where the first week was spent in preparatory work, sounding, dredging, and trawling, in 600 fathoms. The temperature at the bottom was found exactly the same as in former years, 43°-7 Fahr. The fauna was a mixture of Atlantic and Arctic. Several specimens were found of *Brisina coronata* (Sars), *Munida tenuimana*, one large *Actinia*, and a sponge, *Tisiphonia agariciformis*; and among other molluscs,

Axinus eumyrius (Sars), *Kelliella abyssicola* (Sars), *Malletia obtusa* and *Taranis Mörchii*. The second week was spent at Husö, a small island at the mouth of the Sognefiord, where magnetical base-observations were made on shore and on board, ship swung for deviation, &c. On June 20, the expedition left this place and steered along the deep channel surrounding Southern Norway from the Skagerrack up to Cape Stadt. The first soundings and dredgings showed a very flat bottom at a depth of about 200 fathoms, with a fauna mainly Atlantic. About 150 miles north-west of Cape Stadt the temperature began to fall, the depth remaining unchanged. At the next sounding the depth increased, and the bottom-temperature was still falling, until at last the Miller-Casella thermometer showed 32° at 300 fathoms, and 30° at the bottom in 400 fathoms. This agrees exactly with what the *Porcupine* found in the Lightning Channel. Off Stadt the fauna was Arctic and glacial. Among the specimens brought up was a gigantic *Umbellularia*, five feet high, a *Nymphon*, ten inches between the ends of the feet, a new large *Archaster*, and many other characteristic forms. No less than eight forms of *Hydroids* were also found at this depth, three different species of Arctic *Fusus*, and several specimens of *Yoldia intermedia*, &c. The Expedition ran in to Christiansund on June 23, and was to leave that port in a few days for the Faroes and Iceland.

THE *Explorateur* of July 6th announces the intended departure of a French expedition for the exploration of New Guinea. M. Raffray has been entrusted with this scientific mission by the Ministry of Public Instruction, and purposes to study the natural history of several of the Sunda Islands. M. Maurice Maindrow, of the entomological section of the museum, will accompany him to aid in his researches. The travellers intend to leave Toulon on the 20th of this month for Singapore, a transport-vessel having been placed at their service by the Ministry of Marine for the passage. From Singapore, passing by Batavia, M. Raffray will proceed to Ternate and thence to the island of Waigheu, at the western extremity of New Guinea, where it is intended to remain till spring of 1877. Afterwards the travellers will repair to Dorei on the mainland of Papua, and will endeavour to penetrate into Aropen, the country bordering on the south-east of Geelvink Bay, a region which has not yet been visited by the Italian naturalists Beccari and D'Alberty. M. Raffray's expedition is planned to extend over two or three years.

LETTERS have been newly received at Venice from Herr Hansal, Austro-Hungarian Consul at Khartum. He speaks of the magnificent reception given there to the second conqueror of Dar Fur, Ismail Pasha Ajus. This prince made his entry into the town on April 30, after an absence of more than two years, and Khartum was *en fête* for three days. The well-known Nile traveller Piaggia has joined Colonel Gordon's staff, and has been ordered to make for Magungo on the Albert Nyanza. A German, Dr. Snitzer, of Prussian Silesia, who has passed for a Mussulman at Constantinople, and who assumes the name of Emin Effendi, has also gone into the Egyptian service. Mr. Lucas, it appears, is going first up the Nile to Lado (near the old station of Gondokoro), and then intends to return to Meshra el Rek on the Ghazal, and afterwards to follow the direction of Dr. Schweinfurth's track for some distance southward. Dr. Junker, a naturalist from St. Petersburg, has arrived at Khartum with Herr Kopp, of Stuttgart. They are waiting till the rains are over, and then will try to get into Dar Fur, if the same obstacles which prevented Marno's journey thither do not also stand in their way.

THE Rev. S. J. Perry, one of the band of astronomers sent out from England to the southern ocean in 1874 to observe the transit of Venus, publishes a most interesting narrative of the ex-

pedition in his *Notes of a Voyage to Kerguelen Island* (Henry S. King and Co.). The voyage from the Cape to the Land of Desolation through the fogs and westerly gales and rough seas which encompass it, the preparations for observing, and the anxieties of the party as the momentous December 8 approached, are very graphically depicted, and good notions of the scenery, natural history, and climate of the island may be gathered from the notes.

IN the *Geographical Magazine* for July Mr. E. G. Ravenstein has begun a meritorious study of the facts hidden within the great bulk of the eleven volumes of the Census Returns of the British Isles of 1871; with the aid of several maps of the United Kingdom he brings out very distinctly in these first papers a great number of important facts relating to the birthplaces and migrations of the people. Dr. Rink, the learned director of affairs in Danish Greenland, supplies a paper containing the most recent statistics of the people and products of that interesting region. In another paper Captain Davis completes his capital narrative of the voyage of the *Challenger*, following the vessel homeward from Japan. In giving a hearty welcome to the good ship, he notes that she has sailed and steamed over not less than 68,000 miles since her departure from our shores. A good account of the Andaman Islands is also contributed by Mr. De Rœpstorff, to whose intimate knowledge of this region of the East Indies we were formerly indebted for a description of the Nicobar group.

A CAPITAL guide to "Pontresina and its Neighbourhood," by Dr. Ludwig, Resident Physician at Pontresina, has just been published by Messrs. Longmans, for the benefit of visitors to the Upper Engadine. The eminent arbitrator under the European Assurance Society Acts, Mr. F. S. Reilly, who is a member of the Alpine Club, has, with Alpine and public spirit, furnished the English translation, and made other contributions to this useful little book.

BIBLIOGRAPHY OF THE MICHEL ANGELO FESTIVAL.

WE owe to the kindness of Mr. Heath Wilson the following complete list—the only one, we believe, that has been compiled—of the publications which appeared on the occasion of the Michel Angelo Festival last year. It was observed on the day of the festival that numbers of the people had provided themselves with copies of the *Life of Michel Angelo*, and groups were seen reading them eagerly.

ANDREUCCI, Avo. Ottavio. Sulla scoperta di due busti in terra-cotta, e sopra quadro a tempera in tavola, nel possesso, gli uni del negoziante Pietro Radichi, l'altro del Dott. Enrico Gallizioli; opere ambedue di M. Buonarroti. Illustrazione storico-artistica, critica. (Florence: Campolini, 1875. 8vo.)

MARGARET OF ANJOU AND THE CITY OF ROUEN.

In the year 1444 a marriage was arranged, and it was soon afterwards celebrated, between Henry VI. of England and Margaret, daughter of René, Duke of Anjou and titular King of Sicily. Margaret was affianced by proxy in France, and as Queen she made, on June 8, a triumphal entry into the city of Rouen, on her way to England.

Mathieu de Coussy, in the twelfth chapter of his *Chronicle*, gives an account of this entry, and names some of the Queen's retinue, among whom were the Marquis of Suffolk and Edward Hault,* whose names are found in the documents mentioned below. While in Rouen the Queen bought some plate which had belonged to the Cardinal of Luxembourg.

The four documents before me (and of which I now give notes) show that the city of Rouen made presents to the Queen and some of her suite.

The first, second, and third documents are dated respectively April 24, 1444, and the fourth is dated May 7, 1444.

The first is an acquittance by Guillaume le Tavernier and Giuefroy Barnisson, goldsmiths, for 2,063 livres, 13 sols, and 9 deniers tournois, for the sale and delivery of 12 chargers, 12 platters and 12 bowls of silver, red-gilt and burnished, (*vermeil dorez et bruniz*) weighing together 155 marks and 6 ounces, purchased by the burgess-councillors of the town at 13*l.* 5*s.* tournois the mark; which were given (by an order made at the Hôtel de Ville by the said burgess-councillors and many other notables of the town) to the Queen at her entry into the town.

The second is an acquittance by Guillaume Poitevin, goldsmith, for 103*l.* 4*s.* tournois, for the silver furniture, red-gilt, on the case wherein the plate given to the Queen was put so as to keep each piece separate: viz., hinges, braces, latches, and 2 large handles with dragons' heads, weighing altogether 6 marks, 2 ounces, and 13 sterlings, at 16*l.* 6*s.* tournois the mark.

* I assume that he was the Edward mentioned in the fourth document.

The third is an acquittance by Godefray de Coulogne, coffer-maker, and Simonnet de Musurier, *escrip-torier*, for 10*l.* 10*s.* tournois; viz., to the cofferer for making the case where the plate given to the Queen was put, 6*os.*; and to the *escrip-torier* for covering and making the case with leather and painting thereon a daisy (*Marguerite*) and an *Agnus Dei*, 7*l.* 10*s.*

The fourth is an acquittance by Jehan Marcel, burgess and [money] changer of Rouen, for 209*l.* 10*s.* 6*d.* tournois, for the following things: viz., for 2 pots of silver, gilt, and *camoisee*, weighing 11 marks and 16 sterlings, presented by the town to the Marchioness of Suffolk, value 141 livres, 10 sols, 6 deniers tournois; a cup, red-gilt and *pointonné*, weighing 3 marks, given by the town to Wenlok, usher of the Queen's chamber, value 40*l.* 10*s.* tournois; a goblet, red gilt and *pointonné*, weighing 2 marks and 2 ounces, given to Edward, squire of the inn of the Marquis of Suffolk, value 27 livres tournois.

All the sums were paid by Martin Fauvel, receiver of the rents, aids, and revenues of the town of Rouen; and the acquittances for the first three were made by the payees before Guillaume de la Fontaine, Lieut.-General of M. Jehan Salvain, Chevalier, the King's Councillor and his bailiff of Rouen.

CORRESPONDENCE.

WENTWORTH AND CORIOLANUS.

Valladolid: July 3, 1876.

I do not know whether it has occurred to any one that Shakspeare's judgment, on Coriolanus throws some light on what he would have thought of Stratford if he had lived thirty years longer. Stratford, indeed, is not exactly Coriolanus, and still less are Brutus and Sicinius like Pym and Hampden. The Roman has more command over himself, more versatility of nature; but in the main the characters are the same. They both despise the masses for their incapacity for action, their ignorance, and their unsteadiness. They both have a thorough knowledge of all the conditions of success, except that which depends upon sympathy with inferior natures.

Coriolanus shares with Strafford his special dislike of popular control over government (iii. 1):—

"They choose their magistrate,
And such a one as he, who puts his *shall*,
His popular *shall*, against a graver bench
Than ever frowned in Greece! By Jove himself,
It make the Consuls base; and my soul aches
To know, when two authorities are up,
Neither supreme, how soon confusion
May enter 'twixt the gap of both, and take
The one by the other."

This is exactly Strafford's difficulty. And we may be sure that Shakspeare, who admired Coriolanus, would have admired Strafford too. Shakspeare's citizens are wretched creatures, and his tribunes are all that the most embittered Royalist would have said of Pym and Hampden in the days of the Long Parliament. But, for all that, Shakspeare's sentence is against Coriolanus. As the First Officer says (ii. 2):—

"To seem to affect the malice and displeasure of the people is as bad as that which he dislikes, to flatter them for their love."

The pride of Coriolanus is the pride of one devoted to the service of an ideal State, not to the service of the actual men by whom he is surrounded. His failure comes from his standing apart from his fellow-citizens. When he attacks the tribunes they reply as the House of Commons would have done (iii. 1):—

"*Sicinius*. What is the city but the people?
Citizen. True,
Brutus. By the consent of all, we were established
The people's magistrates."

Coriolanus answers almost in the words which Wentworth used at York in 1628:—

"That is the way to lay the city flat;
To bring the roof to the foundation,
And bury all, which yet distinctly ranges,
In heaps and piles of ruin."

This, say the tribunes, "deserves death." Followed by the rabble, they come to seek him:—

"*Sicinius*. Where is this viper
That would depopulate the city and
Be every man himself?
Menenius. You worthy tribunes—
Sicinius. He shall be thrown down the Tarpeian
rock
With vigorous hands; he hath resisted
law,
And therefore law shall scorn him
further trial
Than the severity of the public power
Which he so sets at nought.
First Citizen. He shall well know
The noble tribunes are the people's
mouths,
And we their hands."

One almost fancies that Shakspeare was in spirit in Westminster Hall at the great trial, and that his sympathy was altogether on the side of the accused. But we read on, and we find that Shakspeare knows better:—

"Coriolanus is a grand figure, but
His nature is too noble for this world."

In this world to stand apart from others is to be either a god or a wild beast. The man who would die for Rome becomes a double traitor—a traitor to his country, and a traitor a second time to the Volscians who trusted him. There is nothing left for him but to die by the hands of those he has wronged. Then at last his great qualities can be remembered (v. 5):—

"Though in this city he
Hath widowed and unchilded many a one,
Which to this hour bewail the injury,
Yet he shall have a noble memory."

SAMUEL R. GARDINER.

OXFORD IN 1802.

Bottesford Manor, Brigg: July 10, 1876.

The following letter written by Thomas Taylor, the Platonist, to "Oha" Taylor, Esq., Secretary of the Society of Arts, &c., Adelphi, London," is interesting from the picture which it contains of Oxford seventy-four years ago. Taylor was a fervent believer in the Platonism of Alexandria, and consequently had but little sympathy with either the religion or the culture of the Oxford of 1802. The original is in my own possession.

EDWARD PEACOCK.

"No. 2 New College, Oxford: June 20, 1802.

"Dear Sir,—I should have written to you before, but I have been disappointed in seeing the Dean of Christ Church a second time, till yesterday, & I was unwilling to write till I had again seen him, as I thought he might wish me to transmit some message to you. He has however it seems nothing to send to you but his best compliments. I am much obliged to you for your introductory Letter to him, as he received me in a very flattering manner, said he was well acquainted with my works, & professed himself a great admirer of Plato & Aristotle: & he told me yesterday that he would subscribe to my Plato. I have also received great civilities from Dr. Smith the head of Trinity College, Dr. Winstanley professor of History in Corpus College; & particularly from the professors in New College where I reside. I have likewise found the Manuscripts which I expected to find in the Bodleian Library, to which I have the liberty of access after the usual hours. My application in making extracts from them has been so great, as my time is short, that I have injured my health by it, & must therefore remit my exertions for a day or two.

"I shall perhaps surprize you by saying that Oxford independent of the Bodleian library has no charms for me. For tho' I have received the greatest civilities from the black-gowned gentlemen, yet they appear to me to be in general haughty & superficial, & they flaunt thro' the streets with that self-importance, as if wisdom & wit were inseparable from the robe. And as to the numerous Colleges & Halls in Oxford these, tho' they may be considered as so many palaces, are to me so gloomy from their Gothic structure, that they give a melancholy aspect to the town & its vicinity. Even the trees in which these proud edifices at a distance seem to be embosomed, appear to me to lose all their verdure, as the barbaric towers & spires frown above them. In short every thing is infected with Monkish gloom; & I am not even yet reconciled to my apartments, which are very much in the style of some of the rooms in Mrs. Radcliffe's castles. If it were not therefore, that I consider my residence here for a short time, as necessary to the accomplishment of an object, to which I shall always consider every thing else as secondary, whatever & wherever be my situation in life, I should leave Oxford immediately, so black is the melancholy with which it assaults me. I shall be in town in the course of next week, & expect to return with Mr. Meredith. If you should see Dr. Powell before I return, be so good as to tell him that the two Duncans, Mr. Smyth, and the rest of his old fellow Collegians desire to be remembered to him. Please to give my best respects to Mrs. Taylor & your son, who I hope are well, & believe me to be,

"Yours sincerely,

"THO' TAYLOR."

"N.B.—Please to remember me kindly also to Mr. Borman & Miss Cockins. As I wish to make presents of two of my Aristotle, one to this College & another to one of its fellows, I shall be much obliged to you if you will send those two to me which Miss Cockins has in her possession, the first opportunity."

THE WALLOON CHURCH AT NORWICH AND THE MARTINEAU FAMILY.

Highgate, N.: July 11, 1876.

It is well known that a Martineau came over from Dieppe after the Revocation of the Edict of Nantes and settled in Norwich. The Registers of the French Protestant churches preserved at Somerset House show that Gaston Martineau, who went to Norwich in 1695, was married in London in 1693. I have in my possession a MS.

volume which bears a relic of this Gaston Martineau, of some interest in the history of a family which still so highly bears out its traditions of loyalty to truth and independence. This volume is *Le Livre de Discipline de l'église Walonne de Norwich, du v. Avril, 1589*: a thin parchment folio, seventeen leaves of which are taken up by the "Discipline" or rules for the government of the church, followed by five pages filled with the signatures of the ministers, elders, and others who successively subscribed to the discipline at different times for more than a hundred years. The latest date appears to be 1712. Various notes are appended to the signatures, to the effect that "la Discipline contenue en ce livre a esté leue de point en point en consistoire," and then subscribed. On the last page occurs the entry, "Oe 3^e de Juleit 1690 ont signé la discipline Jean du moulin," and the names of four others; then "le 28 Juin [no year] ont signé la discipline Francois La columbine, Gaston Martineau," and five other names. Thus the precise date of Gaston's signature is not given, but probably it was soon after his settlement in Norwich in 1695.

I cannot find that this "Discipline" of the Norwich church has ever been printed, nor does its existence appear to be known. A few years before this date 1689, the "strangers" in Norwich seem to have been in difficulties on account of their religion, as well as their flourishing manufactures (of which the English were jealous), and it seems probable that this book was drawn up on the basis of the "Discipline Ecclésiastique" of the Protestant Church in France (see Haag's *La France Protestante*, vol. x. p. 38), modified to suit the wants of the settlers in Norwich, and adopted by them partly to satisfy the English authorities. The "Conclusion" says that these articles "ont esté dressés et approuvés par les ministres anciens et diacres des églises françois se recueillies en Angleterre," that they must not be altered, yet there are several articles "qui ont esté dressés pour raison des circonstances, des lieux, des temps, et des personnes," which can be changed on a common deliberation. It goes on:—

"Nous exhortons neantmoins tous les freres du troupeau de se ranger volontairement a cest ordre, lequel nous a semble le meilleur et plus propre pour l'edification des églises quil nous a donnez en charge."

It was first signed on April 29, 1589, by the ministers, elders, and deacons of the church "de la langue françoise recueillie a Norwiche souz la protection de la serinissime Royne Elizabeth."

The book thus fills up the picture of a little church of the oppressed foreign reformed views, complete within itself, under English protection, and capable of absorbing other refugees who sought its shelter from time to time. Thus it was that the Martineaus joined it when they too fled in their turn.

LUCY TOULMIN SMITH.

ON "DOUBLE" IN "MIDSUMMER NIGHT'S DREAM."

London: July 6, 1876.

It is with the greatest diffidence that I approach the strictly-reserved ground of Shakspearean interpretation; and yet it seems to me that Mr. Charles Batten would have more clearly established the sense in which he believes the word "double" is used in the passage quoted by him from *Midsummer Night's Dream*, had he found a better definition of it as a counterfeit stone than that given by him—viz., "two pieces of crystal with a piece of foil between them."

In a "double" or "doublet," at least in all I have ever examined—and many passed under my examination in Bombay—the top of the stone is genuine, and only the under part is false—crystal or glass; the top and under part being joined together by a very clear cement, so that it is most difficult to detect the counterfeit character of the "double." When the top of a "double" is a

ruby, the under part is generally a garnet, and detection by the eye is in such cases almost impossible. There is a great sale of these "doublets" at Candy, and they are often offered for sale at Bombay. Helena's words would mean, therefore, according to Mr. Batten's interpretation, that she has found her "jewel" Demetrius, like a "double," partly genuine, partly counterfeit, that he can "both false and friendly be," "mine own and not mine own."

GEORGE BIRDWOOD.

SCIENCE.

The Geographical Distribution of Animals. With a Study of the Relation of Living and Extinct Faunas as Elucidating the Past Changes of the Earth's Surface. By Alfred Russel Wallace. Two Vols. (London: Macmillan & Co., 1876.)

THE advance of all the physical sciences within the last five-and-twenty years has been wonderfully rapid, but in few have the results gained under new leadership and by a new line of tactics been so striking and important as in the sister-studies of Zoology and Botany. If one turns back to the works of the best biologists written twenty years ago, it is impossible not to be struck with the total change of thought and effort which has since taken place. Here and there some of the new school may have wandered beyond their sphere, or have been hurried into a dogmatism which has been most hurtful to real progress; but the conquests which have already been made, and the ground which lies open before us show that the re-organisation has been as wholesome as it has been complete. In truth, it has been no revolution but a constitutional reform, based on the labours of the good men and true of the old time, and directed and controlled by leaders who saw and understood the changes in the position of affairs and moved in unison with them.

So long as the belief was unanimously held that each form of life was, and always had been, perfectly independent, and that each distinct fauna and flora was separate in its origin as well as in its maturity, the minor details of Biology were necessarily wanting in continuity and value. Its students were exposed to the reproach that their researches led to no results of general importance. Whether some petty weed or noxious insect was a native of this or that country, or whether it should be arranged in this or that family, were questions which might interest the specialist, but were beneath the attention of the philosopher. Now all is changed. Upon the minutest comparisons, upon the most diligent collection of seemingly trivial facts, generalisations and deductions are advanced and combated which will not yield in importance to the profoundest problems of the physicist, the geologist or the astronomer.

Among the chief causes of this reform in Biology have been the wonderful advance of our knowledge of the history of extinct life and of the development of living beings, the scientific study of the geographical distribution of animals and plants, and—springing from these—the promulgation of the doctrine of Evolution. With the latter two of these studies the name of Alfred Russel Wallace must ever remain inseparably connected.

Mr. Darwin and he were the first to give a distinct and intelligible form to the wandering fancies which had been floating in men's brains as to the origin of animals and plants. His travels and personal explorations in South America and in the Malay Archipelago brought to light some of the most interesting facts of zoological geography, and now in the handsome volumes before us we have the results of his mature and deliberate consideration of the whole range of our knowledge of the subject. His aim, he tells us, has been that his book "should bear a similar relation to the eleventh and twelfth chapters of the *Origin of Species* as Mr. Darwin's *Animals and Plants under Domestication* does to the first chapter of that work." This is undoubtedly a very high standard, but we think that most zoologists will consider that it has been fully attained.

Mr. Wallace's work is divided into four principal sections. Part I., on "The Principles and General Phenomena of Distribution," discusses the migrations and means of distribution of animals, the modes in which their ranges have been affected by geological changes, the arrangement of zoographical provinces and the systematic classification adopted. Part II., "On the Distribution of Extinct Animals," gives an excellent review of the present state of our knowledge of vertebrate palaeontology. In Part III., on "Zoological Geography," the great regions and their subdivisions are treated in detail, while Part IV., on "Geographical Zoology," gives a systematic revision of all the families of the vertebrated classes, and of some of the more important groups of insects and mollusks, with their geographical ranges. This last constitutes an invaluable work of reference, but all the matter of more general interest is included in the first three portions, and it is to these that the attention of most readers will be attracted. Before going further it may be remarked that the author has, very wisely as it seems to us, based his conclusions on the study of families and genera, to the exclusion of the consideration of species. This is done because the number of the latter would have been quite unmanageable, and because they are regarded as representing only the more recent and unimportant modifications of form.

As is well known, the credit of having proposed the first really scientific scheme for the division of the earth's surface into zoological provinces is due to Mr. P. L. Scater. In a paper on the "Distribution of Birds," read before the Linnean Society so far back as 1857, he divided the world into two primary sections, *Palaeogaea* and *Neogaea*, answering respectively to the Eastern and Western Hemispheres, and into six "regions." These latter were, (1) the *Palaeartic*, embracing (roughly speaking) Europe, Asia, and Africa, north of the Sahara and the Himalayas; (2) the *Ethiopian*, comprising the rest of Africa; (3) the *Indian*, consisting of India, Malaya, and part of the Eastern Archipelago; (4) the *Australasian*, with Australia, New Guinea, New Zealand, and the Pacific Islands; (5) the *Neartic*, equivalent to North America north of Mexico; and (6) the *Neotropical*,

embracing Central and South America, and the West Indian Islands. Since that date the boundaries of these regions have been rectified, and some important changes in the primary divisions have been suggested, but the scheme as a whole has stood the tests of criticism and of fresh discovery in a way which must be most gratifying to the distinguished naturalist by whom it was propounded. The most important modifications which have been brought forward are those which were proposed by Prof. Huxley in 1868. According to his views the differences between the faunas of the Old and New Worlds are not of equal importance to those between the northern and southern hemispheres, and he consequently made the primary divisions to be *Arctogaea* and *Notogaea*. A modification of this alteration has recently been adopted by Mr. Scater himself in his "Davis Lectures" at the Zoological Gardens and in his Presidential address to Section D of the British Association at Bristol. In these he recognised Mr. Huxley's *Arctogaea*, but divided his *Notogaea* into three, *Dendrogaia* (the neotropical region), *Antarctogaea* (the Australian), and *Ornithogaea* (New Zealand and the Pacific Islands). Mr. Wallace, on the other hand, accepts no higher divisions than the six regions originally instituted by Mr. Scater, contending that the separation of the eastern and western, and that of the northern and southern hemispheres, each indicates important differences, but leaves others out of sight.

The key-note of the general scheme of distribution as propounded by Mr. Wallace in the present work is the comparison of the extinct and existing faunas of each country, and the attempt to trace the course by which that now peculiar to each region assumed its present character. As far as we know, this is the first time that such a mode of research has been worked out on anything like so large a scale, or with such complete materials, and Mr. Wallace's conclusions will be discussed with as much interest by the geologist and physical geographer as by the biologist.

The main result arrived at, round which all the rest group themselves, is that all the higher forms of life seem to have originally appeared in the northern hemisphere, which has sent out migration after migration to colonise the three southern continents. These also appear to have been of great antiquity, varying, indeed, from time to time in form and extent, but each keeping essentially distinct, and each receiving wave after wave of animal life from the northward. In this way Mr. Wallace believes that the main peculiarities and anomalies of the various faunas may be explained.

According to these views the Palaeartic and Neartic regions appear to have remained distinct throughout the whole of the Tertiary period, as is shown by their Cretaceous Eocene and Miocene fauna and flora, but land connexion existed between them, probably to the northwards, and allowed of intermigrations taking place. The former region was much more extensive than it is now; it included the modern Indian, or, as Mr. Wallace prefers to call it, the Oriental region, and it is here, as he believes, that the

vertebrate type was first developed. At a very early period, probably in Secondary times, the Australian region was united to it, and received the then existing mammals—marsupials and monotremes, the former perhaps allied to those whose remains are found in our own Oolite. Since then Australia has remained completely isolated, and its lowly-organised mammals, protected from the competition of their superiors, have survived in the form of its existing kangaroos, wombats, and duck-bills. This is the simplest illustration of Mr. Wallace's hypothesis; the case of the Ethiopian region is more complicated but equally interesting. First it seems to have been peopled by animals of a low type, of which lemurs, insectivores, Edentates, and ostriches were characteristic, and which were certainly derived from the northward. Becoming isolated by the great sea which has left the Tertiary deposits of the Sahara and Arabia, this fauna spread abroad, and a most interesting remnant has been preserved to our own time by the early separation of Madagascar, which is probably the remains of a former eastern extension of the African continent. Then by the upheaval of the more northern parts the highly organised animals, which had come into existence in the meantime in the Palaearctic region, were enabled to cross over, and the apes, monkeys, large Carnivores, elephants, hippopotamuses, rhinoceroses, and antelopes spread over the continent, and the old fauna disappeared before them, leaving only a few stragglers behind. The Oriental region, as already said, was practically combined in early times with the Palaearctic, and shared with it the hot climate of the Eocene and Miocene ages. When the elevation of the Central Asian plateau and the gradual approach of the glacial epoch destroyed or drove southwards such tropical types as were incapable of modification, many of them survived in South-eastern Asia; and thus the Oriental fauna may be regarded as the least changed from that which was once predominant over the whole of Asia and Europe.

As already observed, the North American or Nearctic Continent has remained permanently distinct from the Palaearctic, but was connected with it by land, probably where the North Pacific is still shallow between Kamschatka and Alaska. Although many very extraordinary and distinct forms were developed in the Nearctic region during Tertiary times, yet the majority of the types seem to have been derived from the Old World, where their remains have been found in more ancient strata than in America. Among these were horses, elephants, antelopes, and perhaps lemurs and rhinoceroses; but the *Camelidae*, on the other hand, had their origin in the Nearctic region, where they became extinct after sending out the migrations from which the camels of Asia and the llamas of South America have been derived. Most of this Tertiary fauna disappeared under the influence of the glacial epoch, which was even more severely felt in the Nearctic than in the Palaearctic region, owing to the great mass of land lying in the higher latitudes. Last of the six great regions we have the Neotropical, in

some respects the most interesting of them all. Never apparently connected in Neozoic times with any other continent than the Nearctic, it seems to have been separated and re-united repeatedly, and to have undergone consequent changes in its fauna. First, during the Secondary epoch, it received Rodents and Edentates, which remained long protected from competition and became differentiated into numerous forms, the latter developing such huge and extraordinary types as the *Megatherium*, the *Myodon* and the *Glyptodon*. A reunion in early Tertiary times appears to have introduced the ancestors of the peculiar Neotropical monkeys, which were followed at a later period by mastodons, tapirs, horses, antelopes and camels. In return, the great Edentates just mentioned spread northwards over the southern half of the Nearctic region, but were soon after destroyed by the advent of the glacial epoch.

In a review of this nature it is of course impossible to do more than allude to the immense mass of facts from which Mr. Wallace draws these and other deductions. They have been collected with an industry and discrimination, and are marshalled with a clearness and conciseness, which probably his great colleague Mr. Darwin alone could rival. Nor is it possible here to discuss the minor details of distribution, though it may be remarked that the part which seems most likely to be criticised is the constitution of the sub-regions into which each of the greater divisions is separated; Mr. Wallace gives four of these to each region, an arrangement to which we suspect many naturalists will demur. Of course the specialist will find small errors and omissions in his peculiar department (though few, we fancy, of importance); and it is to be hoped that all naturalists will comply with the author's request to send him such additions and corrections as may help to make the future editions still more perfect. When such appear we trust that they will be illustrated by a greater number of maps; those of the present edition are beautifully executed, but they are small, and so much information is crowded into each that some confusion is the result. This is especially the case in the difference of shading by which the various altitudes are expressed; minute in themselves, they are almost totally obscured by the colouring which indicates the character of the soil and vegetations. The plates represent groups of the characteristic animals of the various regions, and appeal rather to the general than to the scientific public.

In conclusion, we can but concur in Mr. Wallace's hope that the attention of new workers may be directed to a line of research "not inferior in attractions to the lofty heights of transcendental anatomy, or the bewildering mazes of modern classification," and we have to thank him for a work which can only find a fit place on our book-shelves between Lyell's *Principles of Geology* and Darwin's *Origin of Species*.

EDWARD R. ALSTON.

Two Dissertations: I. On MONOTENHIZ ΘΕΟΣ in Scripture and Tradition. II. On the Constantinopolitan Creed and other Eastern Creeds in the Fourth Century. By F. J. A. Hort, D.D. (Cambridge and London: Macmillan & Co., 1876.)

It is refreshing to meet with a work so finished, scholarly, and in every way admirable as this. It deals with points, minute indeed, but—one of them at least—of some considerable importance. The reading selected for discussion in the first dissertation may be taken as a good "crucial instance" of the method of text criticism. The decision given on this point will carry with it that upon a number of others; and it seems to us that Dr. Hort has entirely made good his position, more especially against a recent and able critic who has stoutly advocated an opposite view. Readers of Mr. M'Clellan's elaborate and learned work (*The New Testament*, &c., Vol I., 1875) may be apt to yield to that writer's vigorous dogmatism; but the fact is that in matters of text criticism he has not, and the author of these Dissertations has, thoroughly grasped and mastered the conditions of the problem. Dr. Hort justly insists upon the necessity of tracking out systematically the history of the text, though this is a process the results of which cannot be shown in the treatment of any single passage:—

"In all cases where the text of a single passage is dealt with separately, a deceptive disadvantage lies on those who have learned the insecurity of trying to interpret complex textual evidences without reference to previously-ascertained relationship between the documents or between earlier lines of transmission attested by the documents. Their method presupposes a wide induction, the evidence for which cannot be set out within reasonable limits. Thus, so far as they are able to go beyond that naked weighing of 'authorities' against each other which commonly passes as textual criticism in the case of the New Testament, they are in danger of seeming to follow an arbitrary theory, when they are in fact using the only safeguard against the consecration of arbitrary predilection under the specious name of internal evidence."

The documentary evidence for the reading *μονογενὴς θεός* stands thus: \aleph B C* L 33 Memph. Syr. Pst. and Hcl. mg. [? Aeth.]. That for *μονογενὴς υἱός* incl. as follows: A C^e E F G H K M S U V X Γ Δ Λ II, all cursives except 33, It. Vulg. Syr. Crt. and Hcl. txt. Syr. Hier. Arm. Aeth. codd. The patristic evidence seems at first sight pretty equally divided: for *θεός* are unequivocally, Valentinians quoted by Clem. Alex., Clem., Orig., Epiph., Did., Bas., Greg. Nyss., Cyr. Al.; for *υἱός* unequivocally Euseb., Ath., Theod. Mops., Chrys. Dr. Hort observes upon this evidence:—

"As far as external testimony goes, *θεός* and *υἱός* are of equal antiquity; both can be traced far back into the second century. But if we examine together any considerable number of readings having the same pedigree as *υἱός*, certain peculiar omissions always excepted, we find none that, on careful consideration, approve themselves as original in comparison with the alternative readings, many that are evident corrections. No like suspiciousness attaches to the combination of authorities which read *θεός*. Analysis of their texts completely dissipates the conjecture, for it is nothing more, that they proceed from an imagined Egyptian recension. The wrong

readings which they, singly or in groups, attest can be traced to various distant origins, and their concordance marks a primitive transmission uncorrupted by local alterations. Such being the case, *θεός* is commended to us as the true reading, alike by the higher character of the authorities which support it, taken separately, and by the analogy of readings having a similar history in ancient times."

We may note that, parenthetically, a quite sufficient answer is given to the random and ill-considered statement that the two MSS., the Vatican and the Sinaitic, represent "a corrupt Egyptian text of the fourth century" (McClellan, *N. T.* i. p. xxx). A deeper insight into the principles of text criticism would have shown how utterly inconsistent such a theory must be with the facts. The only scientific method is to collect as widely as possible the instances of manifest and palpable corruption, putting doubtful cases on one side; from these to ascertain what type of text is the purest, and at what different points the different kinds of corruption have chiefly been introduced; and, having done this, to adhere to the standard type as closely as possible. Now all the phenomena converge in indicating as such a text that of which the most distinguished representatives are *Σ* and *B*; so far from presenting a fourth century text, they have not only escaped the corruptions found so plentifully in the old Latin version which dates from the middle of the second, and the other corruptions which found their way into the old Syriac towards the end of the same century; but they have also (especially *B*) escaped a peculiar and different class of corruptions which came in upon the line of the Alexandrine documents. Absolutely pure their text of course is not, but it can be demonstrated to be the purest that has come down to us. It is at least far from being overthrown by the forty or fifty paradoxical readings (some—those of *Σ* alone—not very much to the point) collected by Mr. McClellan out of all four Gospels. If it may be allowed to a novice to speak after a veteran such as Dr. Hort, the present writer may say that his own experience entirely confirms all that is said as to the value of the group of authorities which support the reading *θεός*, and that nothing but chaos would result from letting the mass of later witnesses override them. The beginner will find some very useful and instructive hints, and, indeed, a model discussion of a disputed passage, upon pp. 6, 7.

Dr. Hort, however, does not confine himself to the external evidence; he is careful to weigh the internal as well, both as regards the probabilities of transcription, and also with reference to the bearing of the context. Having worked out this with much subtlety and skill, he then traces the history of the phrase *μονογενὴς θεός* in tradition, showing by the way that it was not used controversially, except "by that very peculiar person, Epiphanius," so that it was not likely to be, as is sometimes thought, a doctrinal correction.

Still following the use of the phrase, the author goes on to discuss the relation to it of a clause in the original Nicene Creed, *τὸν υἱὸν τοῦ θεοῦ, γεννηθέντα ἐκ τοῦ πατρὸς μονογενῆ, τοῦ ἑστῶτος ἐκ τῆς οὐσίας τοῦ πατρὸς, θεὸν ἐκ θεοῦ, κ.τ.λ.* Here the question is raised

whether *μονογενῆ* is to be taken with *θεὸν* and so still preserve a trace of the Scriptural combination. Dr. Hort thinks that it "was put to double duty, combined alike with *ἐκ τοῦ πατρὸς* and with *θεὸν ἐκ θεοῦ*," and that this connexion, though weakened, is not intended to be broken by the parenthesis. We would not say that this is improbable, but it does strike us as perhaps putting somewhat too nice a point upon it. And, indeed, the only objection we could have to Dr. Hort's essay is that there seems to be a tendency at times to follow out the thread of an idea till it becomes almost too fine for profitable discussion.

The note upon the clause in the Nicene Creed forms the connecting link between the two Dissertations. From the Nicene Creed, properly so called, Dr. Hort passes to a consideration of that which has usurped its name, the "Constantinopolitan" Creed of 381. He seems to have proved satisfactorily that this Creed is constructed, not, as is commonly supposed, on the basis of the true Nicene, but rather on the basis of the Creed of Jerusalem—the Church represented by Cyril. The first division of the Constantinopolitan Creed tallies exactly with that of Jerusalem; so does a great part of the second, though a considerable extract is made from the Nicene: the third division had to be for the most part newly framed. The Creed of Nicaea is described as a "dogmatic standard," that of Constantinople as a popular Creed, intended rather for public recitation. Other Eastern Creeds are discussed, and the singular fact is noted that "the Fathers of Nicaea are claimed as the authors of all the three Creeds which have come into permanent ecclesiastical use—the Cappadocian and Mesopotamian, as well as the 'Constantinopolitan.'"

If we were to try to sum up the characteristics of this volume in a single epithet, we should perhaps choose the word "accomplished." We doubt whether any recent theological work, English or Continental—unless, perhaps, an exception is to be found in Dr. Hort's own university—more justly deserves the name. At the same time, the outer world may be pardoned if it grudges to see so large an amount of scholarly *finesse* and skill expended on points some of which do not quite seem to repay it. We would only cherish the hope that it may not be long before we have other and larger works from the same practised hand.

W. SANDAY.

[Since the above was written, a notice of the same work has appeared in the *Theological Review*, from the very competent pen of Prof. James Drummond. This is confined almost entirely to the first Dissertation, in regard to the subject of which Prof. Drummond seems disposed to take a different view. He has brought to light a new passage in Clement of Alexandria, which seems rather to divide that writer's testimony. His discussion of the passage in Didymus may perhaps somewhat impair the "certainty" of Dr. Hort's inference in favour of *μον. θεός*, but it still seems to us to leave it probable. The way, however, in which Prof. Drummond states the MS. evidence makes us doubt whether he too

has not an inadequate conception of the requirements of textual criticism. We agree with him in thinking that Dr. Hort has pushed his enquiry in several places beyond the point at which any clear decision is attainable. But the six objections that he has alleged against the reading *θεός* do not, we confess, appear to us to carry with them all the weight that is supposed. They might be alleged equally against many readings that are nevertheless sufficiently certain. And in any case it will be a degree more probable that the phrase came into the Creeds from the Gospel than into the Gospel from the Creeds. The question must ultimately turn, not so much upon the internal evidence, which is ambiguous, as upon the results of inductive enquiry into the relations and comparative value of the MSS.

W. S.]

SCIENCE NOTES.

THE third number of *Mind* certainly does not fall below its predecessors in the freshness and thoroughness of its articles. It illustrates too, perhaps more distinctly than these, the determination of the editor to secure a hearing for the two opposed schools of British speculative thought. The first paper on "The Origin and Meaning of Geometrical Axioms," by Prof. Helmholtz, is an expansion of the subject expounded by him in the *ACADEMY* of Feb. 12, 1870. In spite of some rather difficult geometric conceptions, it does much to convey to those who are not mathematical experts the meaning of the non-empirical space of Riemann, Beltrami, &c., and it points out, rather too briefly perhaps, the bearing of these reasonings on the necessity of Euclid's axioms and on Kant's doctrine of space as a transcendental form of intuition. The second paper is from the pen of Prof. R. Flint, and deals with "Associationism and the Origin of Moral Ideas." The writer, who unfolds his subject with great neatness and tact, succeeds in putting the case against the associationists with all possible force, though it is quite conceivable that an equally convincing rejoinder might be written from the other side. Mr. F. Pollock, in a short paper on "Evolution and Ethics," vindicates with considerable skill against the reasonings of Mr. Sidgwick the claim of evolution to supply prolegomena to future ethics, though he admits that, even after the displacement of the idea of happiness or pleasure in favour of some conception to be furnished by the evolution doctrine and only provisionally definable as "welfare or some-ness," ethical deductions will practically coincide with the teachings of Utilitarians. Mr. Shadworth Hodgson brings his interesting series of papers on "Philosophy and Science" to a close with a careful criticism of the method of philosophy as recently defined by Mr. Lewes. This chain of more abstruse essays is pleasantly broken by a very readable—not to say popular—account of Hermann Lotze, one of the most reflective, critical, and far-reaching thinkers of contemporary Germany. Finally, Mr. W. H. S. Monck continues the record of philosophic progress at the universities by an account of its principal phases at Dublin.

In the July number of the *Revue Philosophique* the most noteworthy papers are the conclusion of E. von Hartmann's review of the relations of Schopenhauer and Frauenstädt, and a *précis* of the psychological system of Herbart by the editor, Th. Ribot. Hartmann naturally concludes that where Frauenstädt has kept closer to his master than the author of *The Philosophy of the Unconscious* he becomes involved in inconsistencies; where, on the other hand, he has travelled further from Schopenhauer, the departure is not sufficiently justified. M. Ribot's paper is an excellent

summary of a writer who from his position and influence, if not from the remarkable originality of his method, deserves to be much better known in England. The essayist has some valuable remarks on Herbert's anticipation of a scientific quantification of mental phenomena.

In the new number of *The Journal of Mental Science* there is a remarkable unsigned "essay" on John Howard, which hints at the philanthropist's insanity; refuses to praise his motives, on the ground that all motives must be equally good; and denounces the tendencies of his reforms as illustrated in the present "enthusiasm for criminals." This singular paper is accompanied by a string of corrective foot-notes provided, the editor tells us, by one particularly well informed respecting Howard's life and character. The other articles are more strictly medical, though a paper by Dr. Yellowlees (*à propos* of two recent trials for murder at Glasgow) on "The Plea of Insanity in Cases of Murder" appeals to others than medical men through its clear separation of the scientific from the judicial problem of insanity.

THE last number of the *Journal of Speculative Philosophy* (for April) which, as our readers probably know, is dominated by Hegelian conceptions, continues to carry on the valuable work—exposition, criticism, and original speculation—which the journal has for some years performed for the benefit of American philosophical students. The principal philosophical article is one on "Kant's Reply to Hume," by John Watson, which, while pointing out the defects of Kant's system as estimated from the Hegelian point of view—that things are wholly the product of reason, and so do not require the substratum of the *Ding an sich*—contends that Kant has succeeded in completely upsetting Hume's position, and so in establishing once for all the impotence of the empirical or "psychological" methods. The article is clear and precise, and unencumbered by needless technicalities of expression. The useful function which the journal fulfils in introducing foreign speculations to the notice of Americans is represented by a translation of Haanel's account of Herbart's system of paedagogics. The prominence given to aesthetic subjects by Hegelian thinkers is illustrated in the presence of three pieces of aesthetic criticism, of which one on Turner is remarkable for a reverential appreciation of its subject that appears to be derived in part from Mr. Ruskin himself. A paper on the "Relation of Religion to Art," by the editor, brings out, under fresh aspects, the ideas of Hegel on this subject. It is always interesting to see what thinkers of this school have to say on art, and one cannot but be impressed with some of Mr. Harris's remarks on the religious significance of art-ideas—as, for example, that any one of Beethoven's symphonies or sonatas presents us with "a collision between the sensuous and spiritual in human life and the victory of the latter, although frequently with very bitter struggles and plentiful self-sacrifice."

PHILOLOGY.

THAT indefatigable scholar, Mr. Burnell, has published at the Mangalore Mission Press (London: Trübner) an essay on the history of Sanskrit grammar, in which he endeavours to show that the Tamil Grammar *Tolkāppiyam*, the Pāli Grammar ascribed to Kaccāyana, and the Sanskrit Grammar called the *Kātantra*, now being edited by Prof. Eggeling, are all arranged on the same plan—an older and simpler one than that invented by Pāṇini—and he maintains that these grammars, together with the Vedic *Pratīśākhya*s, represent a school of Aindra grammarians who are mentioned in the *Kathāsaritāgāra* and the *Bṛhat-kathā*, and also by the Chinese pilgrims and the Northern Buddhists. The essay (65 pages 8vo, with 53 pages of appendix) is entitled, *On the Aindra School of Sanskrit Grammar: their*

Place in the Sanskrit and Subordinate Literatures, and enters minutely into the question of the historical relationship between the grammars mentioned above; as far, that is, as it seems ascertainable, not only from the technical terms made use of, but also from the general manner and order in which the subject of grammar is treated in each. In the course of the discussion valuable descriptive lists—the most complete yet published—are given (pages 32 and 45–63) of all Indian grammars, whether of the Sanskrit, Pāli, or modern languages, which deal with grammar on the system which Mr. Burnell identifies with that of the Aindra school; and as the learned author acknowledges only two schools, the one just referred to and that of Pāṇini, whom he places about 300 B.C., it will be seen that these lists include a large portion of the extensive Indian literature on grammatical subjects. In Appendix A. Mr. Burnell then discusses the amount of reliance which can be placed on our present texts of Sanskrit works—and especially of the grammatical books—for purposes of historical research. The conclusions at which he arrives are briefly: that Indian literary history may be divided into three periods, which he calls the Vedic, the Mythical, and the Historical, extending respectively down to about 500 B.C., 700 A.D., and the present time; that the texts of the first period were at first unsettled, but have not been materially changed since their final redaction at a date now unknown; that the texts of the second period have been repeatedly reconstructed from different points of view, that they can only be used after the most rigid criticism, and that very little reliance can be placed upon the date of any particular passage they contain; but that in the third period a chronological history is possible, and affords the best foundation for researches into the earlier periods. Lastly, that of the works belonging to the second or mythical period the grammatical works have been the least tampered with, and that all Indian grammars may be classed in three divisions, viz., those belonging to the primitive—Aindra—system, those belonging to Pāṇini's system, and those written in historic times and based either on the one or the other of these two schools. The difficult and uncertain subject with which Dr. Burnell deals will not be settled without much further discussion: but the essay is a most important contribution to the history of Indian literature, and will confirm the high reputation which the author has deservedly gained both for industry and for critical insight.

MR. FREDERIC PINCOTT has published for the use of Hindi students the translation into that language of the *Śakuntalā* lately made by Kunvar Lachhman Singh, a deputy collector of the North-West Provinces (W. H. Allen and Co.). A text of this kind, purer in style and idiom than ordinary Hindi books, was much needed by more advanced students, who will also find Mr. Pincott's copious and accurate, though sometimes too elementary, notes of great assistance. The book is beautifully printed in Messrs. Allen's well-known thick Sanskrit type.

DR. FALLON has issued the second part of his new *Hindustāni-English Dictionary*, and with it has given a re-issue of Part I. We regret to notice that he has felt compelled to raise the price, already quite high enough, chiefly on account of want of subscribers, though Government takes more than 1,000 copies. If the whole work be carried out in the manner of these first parts it will be the only complete dictionary of vernacular Hindustāni—precisely that kind of work which would be likely to be most in demand. The work would be improved if less care were taken to point out all the cases in which words can be used with shades of meaning of doubtful propriety; and if more care were taken to give the full history and correct etymology of the words.

THE *Institutes of Gautama*, by Prof. Stenzler, and the *Institutes of Narada*, by Dr. Jolly, of Würzburg (Trübner and Co.), are important contributions to the history of early Hindu law. The

former gives the text only, of which a translation into German is to follow; the latter, an English translation only, the text being reserved for a future volume. It would be impossible to praise these two books more highly than is done in stating that Prof. Stenzler's is in every way worthy of his high reputation, and that Dr. Jolly's is well worthy of comparison with Prof. Stenzler's. Those who remember Prof. Goldstücker's complaints as to the deplorable effect on modern administration of the paucity of good works on ancient Indian law will realise the importance of these two volumes for the modern jurist; while those who are interested in Sir Henry Maine's contribution to the history of early Aryan institutions will recognise their value as historical documents; and they contain a great deal of matter of philological importance. We are glad, incidentally, to notice the revival of the Sanskrit Text Society, for which the *Institutes of Gautama* are printed.

AFTER so many unsuccessful attempts at a classification of the poetical passages of the Old Testament according to rhythmical rules, Dr. Julius Ley, of Saarbrücken, devotes 263 pages to the subject in his volume, *Grundzüge des Rhythmus, des Vers- und Strophenbaues in der hebräischen Poesie* (Halle, 1875). The book is full of contradictory statements. The author relies on the statements of Philo and Josephus, Origen, Eusebius, Jerome and other fathers, that the poetical passages of the Old Testament consist of hexameters and tetrameters. Anybody, however, who is at all acquainted with the views of these writers knows that their object was to represent to the Greeks the Holy Scripture, if not superior to their literary books, at least as having the same degree of perfection. We would ask Dr. Ley if he thinks that the doctors of the Mishnah and the Gemara were less acquainted with tradition concerning the Old Testament than the above-mentioned writers. None of the former, however, even allude to a rhythmical arrangement of the Psalms. These remained the property of the Synagogues in spite of Hebrew becoming a dead language, and the manner of reciting them passed traditionally from father to son. But there is no trace of a rhythmical recitation among the Jews, not even among those in the remotest East, where the modern theory of harmony has not yet reached the Synagogue. Dr. Ley, to arrange the poetical pieces in octameters and hexameters, is obliged to give a greater number of exceptions than of rules. In basing his theory on the accentuation derived from the Masoreths, he forgets that their school is nothing else than the tradition of the Synagogue as they found it in the sixth to the eighth century, and nothing was there known about a rhythmical method. Had it existed for the Psalms, for instance, the collector who provided some of them with headings would not have omitted to add on what rhythm such and such a psalm is based. Up to the present time no rhythmical form has been found in Phœnician or Himyaritic inscriptions; and the Koran, as far as we know, has no traces of this poetical form. One thing which cannot be denied is that the Psalms at least were arranged for recitation accompanied by musical instruments; therefore we find so often a regular rising and falling accentuation connected with an equal number of syllables, and also a parallelism of phrases in the corresponding verses. The Masoreths, in order to establish this regularity, employed the *Metheg* and the *Maqef*, while the other numerous accents are rather musical notes. If we do not agree with Dr. Ley in his theory about the rhythms in the Old Testament, we do not mean to say that his book is devoid of learning. On the contrary he gives very plausible explanations of some forms occurring in the verbs *medias vav* and *gemina*, and his enumeration of archaic forms, especially in the particles used in poetical pieces, is very exhaustive. These forms Dr. Ley takes as rhyth-

nical necessities. In our opinion the poet applied them for the sake of methodical harmony.

AFTER a lapse of several years a fourth fasciculus of the fifth volume of the *Abhandlungen für die Kunde des Morgenlandes* (published by the German Oriental Society) has appeared, containing a very elaborate paper on Samaritan literature, language, and dogma, together with two Samaritan texts, by Dr. Samuel Kohn. (There is a serious misprint on the page of contents; the author's name is given as Dr. S. Kohn, a writer on Hebrew-Persian literature.) The author is well known as a Samaritan scholar from his previous papers on the same subject in Frankel's *Monatsschrift*, and he is, so far as we can judge, perfectly acquainted with the latest publications on the subject. Dr. Kohn's paper is divided into three parts. (1.) The text of a Samaritan *Haggadah*, or prayer and hymns recited on the occasion of the celebration of the Passover, published from two MSS. belonging to Prof. Delitzsch, of Leipzig. This text, although provided with an Arabic translation written in the Samaritan characters, the sense being therefore certain, still needs a commentary in order to indicate whence the legendary part in these hymns is borrowed, as well as to explain some philological peculiarities. This part is admirably done by Dr. Kohn. (2.) A study on the Samaritan Targum in Petermann's edition and on Abu-Sa'id's Arabic translation of the Pentateuch. Here also we find much original matter, especially in the part where the author treats of the Arabic expressions which have passed into the later MSS. of the Samaritan Targum. (3.) Fragments of this Targum published from MSS. in the Library of St. Petersburg. We regret that Dr. Kohn was not acquainted with Mr. Nutt's *Fragments of the Samaritan Targum* while writing his able contribution; he promises, however, to pay full attention to it on some future occasion. The index at the end is very minute, and really facilitates the use of the paper, which extends to 225 pages.

MEETINGS OF SOCIETIES.

SOCIETY OF ANTIQUARIES.—(Thursday, June 29.)

REAR-ADMIRAL THOS. A. B. SPRATT, C.B., exhibited a marble statue of Venus, which was discovered about twenty years ago at Gnosos, in Crete. The head, of which the upper part is lost, was found about 200 yards away from the body. The left arm is missing. The height of the figure is 23½ inches. The goddess is represented as preparing for the bath, removing her left sandal with her right hand. A draped pedestal, with a rudder standing beside it, is on her left side, and the raised foot rests upon a swan. A similar statue was found at Cyrene, and there are many instances of the same attitude, in bronze, at the British Museum and elsewhere. The head is small, though the forehead is high, and the proportions generally are more slender than is usual in Greek art. The leg also, as compared with the thigh, is longer than the Vitruvian canon allows. In these respects it resembles the works of Lysippus more than those of other sculptors.—A. W. Franks, Esq., exhibited a volume containing contemporary copies of documents referring to Arabella Stuart, and of two poems, one of which is evidently an appeal from her to James I., though perhaps not written by her. The other describes a vision seen by a man imprisoned in the Tower, but is rather obscure. The binding is of cut vellum, in imitation of lace. In the centre are the arms of Q. Elizabeth, with the motto "Semper eadem" beneath. At the corners are two T's and two A's with true-love knots. Mr. Franks suggested that these letters might designate Elizabeth or Isabella Lennox, Arabella's mother.—The Rev. J. Collingwood Bruce gave an account of recent excavations at South Shields on the site of a Roman camp, which will shortly be built over. The ramparts are clearly traceable. The walls are five feet thick, and in some places five or six courses are still left standing. The dimensions are 360 feet by 615 feet, a size equalled by few stations on the Roman Wall. The four gates are not placed in the centre of their respective sides. At the eastern gate the guard-

chamber was found, the walls being covered with coloured stucco. In the centre of the camp was a small forum, containing an *acarium* with very strong walls clamped with iron, and sunk beneath the level of the ground. The five steps by which it was entered were still in their original position. The character of the masonry was good throughout, and the stones large, being principally freestone and magnesian limestone. From the tooling still visible on some of the stones Mr. Bruce conjectures that the building is of the time of Severus. On the west side was the burial-ground, where, among other remains, a skeleton was found, covered with a tomb rudely built of slabs of stone. Several skulls and bones were found in the *acarium*, probably the relics of soldiers slain at the time of the evacuation of the station by the Romans. The coins were mostly of the Emperors Trajan and Valens. Among other objects were four or five swords, from two to three feet long, with wooden scabbards and bronze chapes; lamps, fibulae, a stone fir-cone, bones and horns of deer and oxen, whelks, limpets, and oysters, the last of which are not found at present in the neighbourhood.—Octavius Morgan, Esq., exhibited a long rowelled spur, of the fifteenth century, which was found during the present year in Parliament Street, at a depth of 18 ft. below the surface of the ground.—The Rev. F. G. Lee exhibited a carved wooden bowl with a cover of the time of James I., and Mr. Franks exhibited one of similar workmanship, but without a cover, on which were carved the arms of England and the letters "I. R."

SOCIETY OF BIBLICAL ARCHAEOLOGY.—(Tuesday, July 4.)

S. BIRCH, LL.D., D.C.L., &c., President, in the Chair. The following papers were read:—I. "Notes on Cypriote Palaeography," by D. Pierides (Larnaca). This paper consisted of three communications to the President of the society, describing nine different Cypriote inscriptions which had been discovered during the recent excavations of General di Cesnola. The inscriptions were chiefly of a votive character, and contained several proper names, together with a few variants of the Cypriote characters already known. One of the most curious objects described by M. Pierides was a small seal representing a stag or mare suckling her young one. In the field of the seal were a few well-defined Cypriote letters, of which, together with those of the other eight texts, the author of the paper offered a transliteration and a translation. II. "Notes on Assyrian Religion and Mythology," by W. St. Chad Boscawen. In this paper the author pointed out the close parallel between the Jewish code and the Assyrian as to the effect of prayer as an antidote to sin. Extracts were given from various Assyrian tablets relating to the treatment of penitents, and to the times and places of prayer.

FINE ART.

Notes on the Churches of Derbyshire. By J. Charles Cox. Vol. I., The Hundred of Scarsdale. (Chesterfield: Palmer & Edmunds; London: Bemrose & Sons, 1875.)

SOME thirty years ago, when the taste for ecclesiology was in its infancy, Mr. John Henry Parker proposed to publish descriptive notices of the parish churches of England. The project unfortunately did not meet with the support it deserved, and after the issue of a few parts the work was discontinued, and, to the best of our belief, has never since been resumed. But meanwhile the fabrics themselves have certainly not been let alone. They have been visited and inspected more than ever by archdeacons and archaeologists; they have formed the subject of Parliamentary blue-books, of begging-letters, and of political and antiquarian controversy. By one party they have been swept clean; by another garnished with a vengeance, and by both denuded of

many of their most interesting features. In fact, it may be doubted whether our churches have not suffered more from the injudicious zeal of the present generation than from the apathy and ignorance of the past.

Happily there is another side to the picture. Popular attention has at any rate been drawn to a class of structures of which we may be justly proud, and, in a piecemeal sort of way, much progress has been made towards accomplishing the useful project which Mr. Parker set on foot. To these desirable results Mr. Cox's volume is in itself no inconsiderable contribution, and we thank him heartily for it. He assures us, and we can well believe, that the work he has undertaken has been an enjoyable relaxation from other pursuits, and that it would cause him a pang of regret to abandon the labour of love to which he has committed himself. This is the spirit of the genuine antiquary, and we shall share the author's disappointment if it does not meet with the encouragement it deserves.

Mr. Cox has not only personally inspected nearly every church which he describes, but has also investigated, with rare and painful industry, every available source of information, both as to the history of the buildings and also of the parishes in which they stand. Among the MS. documents which have been consulted with most advantage are the ecclesiastical surveys made by order of Parliament in 1650, and now deposited in the Library of Lambeth Palace; the collections of Adam Wolley in the British Museum, and the Church Notes of Francis Bassano in the possession of the College of Arms. These last are of peculiar value, inasmuch as they were made at the very commencement of the last century, and, therefore, at a time when the hand of the innovator was comparatively harmless.

By a judicious use of the materials thus acquired Mr. Cox has been able in many cases to rebuild (in print) the ancient edifices, to restore ruined monuments, to decipher inscriptions now illegible, and to insert afresh those far too numerous features which have been removed by some agent more active than "decay's effacing finger." In the matter of inscriptions the author found it necessary to exclude those belonging to a later date than the reign of Henry VIII., but he has not adhered rigidly to this rule, and in every case has reproduced monuments which have disappeared or have been defaced. And here we must make the only disparaging remark which Mr. Cox's volume provokes. Epitaph-writers take so many liberties with a dead language that we really cannot tolerate any addition to them. We should therefore have been glad if a little more care had been shown in transcribing, or correcting the printer's errors in the Latin inscriptions. Even the philosopher Hobbes (author of a Latin poem on the *Wonders of the Peak*) falls a victim to this form of negligence, for it can hardly be that the inscription to his memory in Hault Hucknall Church is disfigured with a false concord, and the deceased described as "Ver probus."

With this exception, all that we have to say of Mr. Cox's book is in the highest degree favourable. Such industry as it ex-

hibits is rarely found now-a-days, and still more rarely in combination with so much general and special knowledge. It is impossible to look through the volume without feeling that, from an archaeological point of view, the National Church has been a national advantage. The parish church has been the means of preserving the parish history in its most interesting form, and Mr. Cox has found that the annals of both must be recited together, and thus his Church Notes are in fact no mean substitute for a county history. We need scarcely say that Derbyshire is not, like East Anglia, especially rich in ecclesiastical architecture. Its spires cannot vie with those of Northamptonshire, nor its Perpendicular towers with those of Somerset. But, in spite of this, and the further fact that besides Ashbourne and Chesterfield there are no fabrics of the first importance in the county, Derbyshire is an attractive field for the ecclesiologist. The material of which the buildings are formed is durable, and suffers little from the lapse of time; the chief injuries have come from ignorant zeal, or, as at Newbold, from religious fanaticism. Yet enough survives to tempt one, with Mr. Cox's volume in hand, to ramble through the Hundred of Scarsdale, and see with one's own eyes the sculptured stone at Bolsover, the reredos at Chesterfield, the interesting monuments at Ashover and Brampton, and the beautiful specimen of Norman work at Steetley, which we sincerely hope Mr. Cox may be able to save from the destruction that so often follows desecration.

CHARLES J. ROBINSON.

THE ROTTERDAM ART EXHIBITION.

THERE is now open at Rotterdam a very fair exhibition of paintings—judging, *bien entendu*, from the standpoint of a town that is not a capital. Few of the best-known Dutch painters have sent pictures, as they find Paris and Philadelphia more productive of money and fame; but the young men are well represented, and they, with the help of Ten Kate, Rochussen, Klinkenberg, and a few foreigners, make a respectable show. With some consideration for visitors, too, the hanging committee have put almost all the hopelessly bad pictures into the last two rooms, so that anyone who likes may stop at the doorway. Of really first-rate pictures there are few: Munkacz's *Woman Resting*, Klinkenberg's view of the Vijverberg at the Hague, and Otterbeek's fine portrait of his brother artist Vermeer (lately deceased), are perhaps all that one would feel inclined to put in the first rank. Of these the first-named is full of pathos and dignity, and the painting is broad and massive, befitting the subject. The woman, wearied with the huge faggot she is carrying, sits resting on a bank in a wood: the evening shades are deepening upon her scarlet kerchief, blue apron, and black dress. Klinkenberg's view of the Hague is really a delightful picture, worthy almost of Van der Heyden, whose little town view in last year's "Old Masters" was so much noticed. But the view is of the Hague of to-day, when the bricks are no longer of that brilliant red that Van der Heyden loved to paint; time has toned them down, as time will one day tone down even Keble College! It was pleasant to see that this admirable picture has been bought for the Boyman's Museum at Rotterdam, that least known, but by no means least noteworthy, of all the Dutch galleries. Among pictures of the second rank might be put those by Dansaert, of Brussels, one of Meissonier's many imitators. His two single

figures, *Overwegend* and *The Smoker*, are capital; and the price—just one-twentieth of what the master would get—shows a modesty very proper in a pupil. The same painter's *Coffee-house under the Directory*—a club-orator haranguing—is one of the most ambitious pictures in the rooms; in fact, it is perhaps too ambitious. Herman ten Kate's *News from the Army* is hardly up to the mark of this artist, whose smaller works, at least, are so much sought after in Holland. A painter (to judge from his prices he is as yet little known) of a higher quality than most is H. J. Melis, of Rotterdam, whose two domestic scenes suggest the influence of Josef Israels. *Mother's Joy*—a Dutch peasant woman rocking a child in her arms—is a simple and delightful picture, free from that too common vice of modern art, the desire to tell an elaborate story upon the canvas. The old painters, Dutch as well as others, followed a better principle when they seized typical scenes—scenes in which whole departments of life were, as it were, summed up, as where Maas told the tale of unceasing industry in his *Woman Spinning*, or Terburg registered the life of the ornamental classes in his *Guitar Lesson*. Such pictures as this of Melis, or as David de la Mar's charming *Milking Time*, suggest thoughts like these by the very contrast between their simplicity and the laboured innuendo of half the pictures of modern times.

Albert de Vriendt, of Brussels, in his *Council Hall in the Fifteenth Century* (which fair maidens are profaning by a game of ninepins), and Julius Kronberg, of Munich, are rivals in the art of painting tapestry. Another Munich painter, Zimmermann, in a small head of an old woman, shows that there is a new era beginning in that city where Overbeck ruled so long. Luminais, of Paris, whose specialty seems to be the ancient Gauls, is at least vigorous, though his nude girl stretching her arms with a vehemence perhaps peculiar to that people cannot be called attractive. Rochussen's *Suspected House, Sixteenth Century*—a scene of the religious wars—is a powerful sketch, although his other picture makes one regret that this artist does more than sketch. J. H. Wijkamp, of Rotterdam, has painted with spirit and force a characteristic Dutch winter scene—the launch of the ferry-boat among the breakers and ice-boulders of the tempestuous Maas. Offerman's old woman polishing the clasps of the family Bible is as characteristically Dutch in another line. Lastly may be noticed Altmann's two fancy portraits of Jan Steen and Paul Potter; of which it may be said that probably the very last of their contemporaries that those painters would have chosen to paint their portraits was Mieris, and that Altmann is an inferior Mieris.

T. H. WARD.

THE ECOLE DE ROME.

Paris: July 2, 1876.

The regulation exhibition of the works of the students of the Ecole de Rome opened yesterday in the Ecole des Beaux-Arts. The sculpture, as was the case in the last Salons, is far superior to the painting. A higher degree of invention, execution and science—such science as we can expect from young men of that age—are generally noticeable.

A *Temptation* of M. Injalbert's calls for special attention; M. Injalbert is a student of the first year, and his striking figure of Orpheus losing Eurydice at the gates of hell, at the competition for the Grand Prize, was, you may remember, noticed by me at the time. The present work consists of three life-size figures in high-relief of Adam, Eve, and the Tempter, remarkable alike for strength and elegance, set in an oblong frame. Eve is represented bringing the apple to Adam, who half raises himself and appears to be waking from a deep sleep. The form of the Tempter justifies this act of feminine treachery, consisting in offering the poison to a man who is hardly yet aroused

from his dreams: from the tip of the tail to the loins the Tempter wears the form of a serpent, coiled round the tree of knowledge of good and evil; from the loins upwards the form of a woman, a woman with a triumphant and treacherous smile, and a pair of small wings growing out of her head that add to the strangeness of her appearance.

M. Injalbert has also made a marble copy of a charming antique in Florence known as the Apollino. Great hopes may fairly be entertained of this young artist.

M. Idrac, student of the first year, sends a *Love Stung by a Bee*, who lifts up the leg which has been stung, and dances about on the other while he makes an ugly face. The thought did not, I dare say, occur to the artist, but for my part I think it quite right that a bee should by means of his sting teach children that roses, even when they are strewn on the ground, are not intended to be trampled upon.

M. Marqueste, whose picturesque group of Theseus cutting off the head of a Gorgon, noticed at the Salon, has just been bought by the Government, has only had time to rough-hew a draped figure of a woman, intended for a *Velleda*, lying on and supported by a rock. The figure has great fullness of contour.

I pass over in silence a medal of no merit, by M. Dupuis, and some chalk studies from nature and from the antique by M. Bouteille, a student in line-engraving. The Roman Prize was given to him merely for the sake of keeping to the rules.

The productions of the students in architecture consist, as usual, of drawings from details of ancient buildings, very ably executed, and restorations of ancient monuments. I can only briefly mention MM. Loriot and Lambert's studies on Pompeii, on the temple of Antoninus, and on the portico of a church in Brescia, and M. Ulmann's restoration of the temple of Brescia, built by Vespasian. I have often asked why a modern nation should send its young men to study exclusively, for the space of four years, the ancient or Renaissance monuments of another nation, whose constructive materials, climate, state of civilisation, and genius are so entirely different from its own physical and social conditions; and, above all, why this modern people, which in the Middle Ages—in the dawn, that is to say, of modern societies—had an admirable school of architecture of its own, does not require these young men, who one day will have charge of its most national and useful monuments, to acquire some knowledge of the remains of its own national architecture. This question I still continue to put to all true-minded men.

The paintings sent in consist of a *Source*, a nude figure, common and in no sense mythological, reclining on the edge of a ravine and holding a large jug, such as are in use now among the Calabrian peasants, upside-down; a *Medea* draped in black, receiving the caresses of her two children, seated before some famous yellow curtains made fashionable by Régnault; an excellent copy, by M. Ferrier, of a *Saint George*, one of the Venice Carpaccios. Carpaccio has been very much the fashion of late years; he is certainly one of the early masters who was most learned in draughtsmanship, most true in his movement, and most brilliant in his colouring. One of the triumphs won by the criticism of our day is the having in some measure restored him to life. M. Ferrier sends, besides, a bright and clever sketch for a ceiling-piece. This young artist, before he entered the Ecole des Beaux-Arts, was a pupil of one of the most remarkable teachers of our day, M. Lecocq de Boisbaudran. There was cause to dread the influence of the Italian climate and the régime of the Villa Medici on his temperament, for he sent a most commonplace *David Slaying Goliath* to the last Salon. But the crisis is over; his natural genius has regained the mastery.

As for M. Toudouze, a student of the fourth year—that is to say, on the point of coming back to France—will he regain his lost vigour here?

Most desirable it is that he should, but hardly to be expected. His *Lot's Wife* is a confused bit of composition, ineffective both in colour and drawing. Nothing could be more droll than this statue of white salt erect in the middle of the picture. Angels and young winged creatures flutter like enormous swallows in the enclosure of a Turkish town adorned with bits of majolica, and the artist's realism has rather got the better of his mysticism. Can you conceive the Bible illustrated with photographs?

As I close my letter the exhibition of Black and White opens. PH. BURTY.

ART SALES.

ON the 6th inst. Messrs. Christie, Manson and Woods sold the valuable collection of porcelain of Mr. J. Staniforth. In Oriental, a pair of hexagonal vases with medallions of flowers sold for 37l.; a turquoise crackle bottle, 11l.; pair of crimson vases, with medallions of figures, 65l.; pair of turquoise crackle vases, 51l.; pair of turquoise crackle bowls, with Louis XV. ormoulu mountings, 50l.; and a pair of double fluted jardinières, 55l. The Dresden figures attained high prices: pair of groups, lady and gentleman seated, the plinth encrusted with flowers, 6 in. high, 70l.; pair of pug dogs, 30l.; pair of Chinese children in flowered pattern dresses, 44l.; four figures, masquerade, 80l.; pair of figures, lady and gentleman singing, 40 gs.; Negro boy seated on lion, 61l.; group of two children, with emblems of Spring and Winter, 51l.; group of three children representing Music, Song, and Architecture, 56l.; group of lady and gentleman with pug, 30l.; another with guitar and flowers, 41l. 1s.; pair of busts of children, 50l.; pair of groups, Apollo, Venus, and Cupid, 55l.; five female figures, with emblems on plinth representing the Five Senses, 200l.; Another set of four, representing the Seasons, 185l.; another, lady with hoop dress and gentleman, 77l.; pug dog, 32l.; pair of candelabra, with figures, 78l.; pair of candlesticks, boys holding fish, 58l.; clock, with Cupids and flowers in relief, 78l.; fountain, with figure of Neptune on pedestal formed by satyrs and shell-shaped dish, 200l.; Frankenthal group of Venus and Adonis, 28l.; four Chelsea Derby figures of the Seasons, 95l.; Capo di Monte porcelain snuff-box, with classical subjects in relief, 75l. Of Chelsea, a box formed as the head of a man, 34l.; patch box, formed as a female head, diamond eyes, 38l.; another, as a man's head, 31l.; needle case, painted with flowers, 19 gs.; scent case, female head, with diamond eyes, 27 gs. The Dresden snuff-boxes ranged in price from 15l. to 25l. Bonbonnières, with Watteau subjects, 53 gs., 48 gs., 46 gs.; enamel portrait of Peg Woffington, 26l.; of Madame de Pompadour, in Louis XV. frame, 88 gs.; of Marshal Catinat, 80 gs.; of Madame de Parabère, 48l. Battersea enamel box, with garden scene and Watteau figures, 71 gs.; pair of Louis XV. ormoulu candelabra, with Nymphenburg porcelain figures, 210 gs.; Louis XV. ormoulu chandelier for nine lights, 96 gs.; pair of Louis XVI. wall lights with three branches surmounted by baskets of flowers, 46 gs.; Louis XVI. mahogany side-table mounted with ormoulu, 76 gs., and the companion, 70 gs.; Sevres plaque, turquoise and gold, mounted on mahogany table with ormoulu chasings in the style of Louis XVI., 230 gs.; Louis XVI. dwarf screen, painted with Watteau figures, 120 gs.; five panels of tapestry, with oval medallions of children, 300l.; six carved and gilt Louis XVI. arm chairs, covered with tapestry, 194 gs.; set of old Genoa curtains of cut velvet-pile flower pattern on white satin ground, 400 gs.

THE whole of last week and five days of the week before were occupied by Messrs. Sotheby in the sale of the enormous collection of engravings formed by Mr. Anderson Rose. A selection from the mass had been exhibited at the Guildhall and in various provincial towns, and the advertise-

ment thus afforded to the collection proved no doubt to be of material advantage to the sale. Moreover, the catalogue of the collection, which could in no case have been brief, was swelled by biographical notices of the personages whose portraits figured in the sale. It was likewise illustrated. The modern part of the collection was in some ways disappointing. Méryon, the greatest modern master of original engraving—the genius whose name will live with those of the great masters of the Renaissance, when the fashions of a day shall have gone by—was represented, indeed, by many of his works; but these were, with but few exceptions, of quality notably inferior to those which came before the public two months ago in the collection of M. Philippe Burty, rich in many things, and richest of all in Méryons. The Méryons at Mr. Anderson Rose's sale appear to have fetched prices out of proportion to their quality. The Haden's were not in great force. The Whistlers were many and fine, but it may be doubted whether enlarged familiarity with Mr. Whistler's work in etching adds greatly to the conviction of merits always allowed to be considerable. A few fine etchings by Millet were in the sale, and there was a very large collection of the work of Legros, which has something in common with that of the elder master. The merits of both are sterling and undeniable, and greater undoubtedly than their immediate attractiveness. Among the living artists who devote themselves to the reproduction of the work of others Flameng and Rajon stand first. These were well represented. The following prices were realised for modern etchings:—Méryon: *Le Pont au Change*, vers 1794, after a design of Nicolle—a good impression—11. 15s. (Goupil); *Le Stryge*, third state, 11. 13s.; *Le Pont au Change*, second state, 31. 10s. (Goupil); the same, third state, 41. 6s.; *La Morgue*, fourth state, 11. 8s.; *L'Abside de Notre Dame*, third state, 11. 15s. Of these impressions some were very poor. *A View on the Seine*—No. 451 in the Anderson Rose Catalogue—was sold for 11. 15s. There would seem to be hardly sufficient evidence for assigning it to Méryon at all. Research would probably succeed in identifying it as the work of some other artist. Of Mr. Haden's work, a portfolio containing the twenty-five plates of the published set sold for 20l. (Goupil); a selected impression of the recent large vigorous etching of *Calais Pier*, 16l. (Thibeaudeau); an impression of the *Agamemnon*, 5l. (Goupil), and two etchings, *Park Scene* and *Donkeys in a Wood*, 21. 12s. 6d. Of Mr. Whistler's work, so largely represented, we quote the following prices:—*La Rétameuse*, 11. 4s.; *En Plein Soleil*, 11. 1s.; *The Unsafe Tenement*, 21. 3s. (Colnaghi); *La Mère Gérard*, first state, pure aquafortis, without any background, 11. 16s., and two impressions of the second state, 17s.; *Street at Saverne*, by moonlight, 21. 5s. (Colnaghi); *La Vieille aux loques*, 31. 10s. (Colnaghi); *The Kitchen*, a fine impression of what must be accounted Mr. Whistler's most attractive work, 21. 3s. (Colnaghi); *Black Lion Wharf*, 21. 15s.; *The Houses of Parliament*, with a view of Old Westminster Bridge, first state, 21. 5s. (Noseda); *Old Hungerford Bridge*, 41. 10s. (Colnaghi); *The Lime-burners*, two impressions, 61. 8s. 6d. (Goupil); *Limehouse*, first state, 31. 9s. (Hogarth); the same print, second state, 11. 11s.; another impression, on Japanese paper, 21. 2s.; *Rotherhithe*, first state, 11. 18s.; *Thames Police*, 11. 5s.; *Portrait of Monsieur Becquet*, violoncello player, 81. (Goupil); *Finnette*, first state, drypoint, Japanese paper, 31. 3s.; *Portrait of Ross Winans*, playing an accordion, 31. 4s. (Noseda); *A Lady at a Piano*, 31. 13s. (Thibeaudeau). A set of Wilkie's etchings, seven in number, given by Wilkie himself to Sir Edwin Landseer, was sold for 71. 14s. A set of ten etchings by Geddes, given by that artist to the same great animal-painter, sold for 51. 5s. A lot of etchings, by Mr. Charles Keene, twenty in number, sold for 51. 7s. 6d. (Palmer); A set of Veyrassat's etchings sold for 21. 7s. A

set of twenty-one pleasant etchings by a well-known amateur, Mr. J. P. Heseltine, sold for 11. 10s. Of Legros' masculine work, we note the following prices:—*An Old Beggar lying dead at the Foot of a Tree*, two impressions, 11. 10s. (Thibeaudeau); *Portrait of Victor Hugo*, last state, 11. 1s.; *Portrait of Delatre*, the printer of etchings, 21. 2s.; *The Lecturer*—a phrenologist with an array of human skulls before him—very rare, only four impressions being known to exist, 21. 2s. (Palmer). *The Sacrament, Women Kneeling*, very fine, 11. 1s. (Noseda). *Landscape, Early Morning*, 61. (Thibeaudeau). By Millet there were seven etchings, of which one, *Allant travailler*, is probably the most impressive work of the artist as an etcher. It fetched 91. (Goupil), while *La Batteuse de Beurre* fetched 21. 4s., and *La Cardeuse*, a fine proof of great rarity, 101. 10s. *La Couseuse* fetched 11. 13s. (Lauser), *Les Glaneuses*, 41. 10s. (Colnaghi), and *La Nourrice*, 31. 10s.—all of them, as their names imply, versions of peasant-life, roughly poetical. Of the etchings of Flameng we note especially two impressions of *La Source* of Ingres, which went for 21. 7s.—one of them was an *eau forte pure*, only three impressions taken—a brilliant proof of the *Stratonic*, held by some to be the masterpiece of the same master, only 18s.; and *La Ronde de Nuit*, a fine proof of one of Flameng's most elaborate productions of Rembrandt, 61. (Thibeaudeau). By Rajon, of whose reproductions there were many fine examples, we note an artist's proof of *John Stuart Mill*, after Watts, 41. 1s.; an artist's proof of the *Cour de Maison Hollandaise*, after De Hooghe, in our National Gallery, 21. 1s., and an artist's proof of *The Smoker*, after Meissonier, 21. 2s. Bartolozzi's print of *Miss Farren*, afterwards Countess of Derby, from Sir Thomas Lawrence, fetched 31. 3s. Of the works of the great line-engravers of portraits who flourished in the seventeenth and eighteenth centuries there was sold, by Abraham Blooteling, who worked in Holland and London, a portrait of *Cornelius de Witt*, for 41. 6s.; by Pierre Drevet, the elder, a rare and fine portrait of *Adrienne Lecouvreur*, 31. 15s. (Noseda); and a first state of *Lord Halifax*, after Sir Godfrey Kneller, 71. 7s. (Thibeaudeau). By Edelinck, many great works were absent, and nothing present fetched over a guinea. By Reynolds Elstracke, the portrait of *Cardinal Wolsey*, fine and rare, passed into the hands of Messrs. Goupil for 101. 15s. By William Faithorne, many of whose finest things were necessarily absent, a portrait of *Frances Brydges, Countess of Exeter*, fetched 71. 7s., and one of *Sir Thomas Fairfax*, 61.; the small print of *Henrietta Maria*, in widow's dress, a proof before any letters, 81. 12s. (Noseda); *Thomas Hobbes of Malmesbury*, 31. 3s., and *John Milton*, 51. 5s. By Antoine Masson, the fine portrait of *Brissac*, known as "the greyheaded man," fetched 121. 15s. (Noseda); by Robert Nanteuil, *Jacques Amelot*, premier Président de la Cour des Aydes, from the Brentano Collection, 21. 2s., and a portrait of *The Great Condé*, 21. 2s. Prince Rupert's *Head of the Executioner of John the Baptist* sold for 61. 15s.; Ludwig von Siegen's portrait of the *Landgravine of Hesse* for 151. 10s. The work is interesting as being that of the supposed inventor of mezzotint. Giulio Bonasone's portrait of *Philip II. of Spain* was sold for 61. Calamatta's modern engraving of the *Gioconda* of Leonardo da Vinci for 61. 5s. A set of proofs before letters of Ceroni's *Emaux de Petitot*—fifty portraits of historical personages and celebrated women of the time of Louis the Fourteenth—sold for 41. (Goupil). Of the works of the elder masters of engraving and etching, there were few fine impressions. *Christ Descending into Hell*, by Mantegna, fetched 41. 10s. Of the works of Lucas van Leyden we note the following prices:—*Christ before the High Priest*, 81. 8s. (Lauser); *The Return of the Prodigal Son*, 91. 10s. (Lauser); *The Poet Virgil Suspended in a Basket*, 151. (Goupil); and *David Playing on the Harp before Saul*, 211. 5s.

(Nosedá). Among the Dürer engravings, *The Prodigal Son*, 10l. (Goupil); *Apollo and Diana*, 10l. 5s. (Nosedá); *Philip Melanchthon*, 16l. 15s. (Nosedá). There was a single etching by Claude, a rare subject, but not a fine impression: the subject *Soleil Couchant* (Dumesnil, Numéro 15), 16l. The Rembrandts were generally not of a good class: an impression of the portraits of *Rembrandt and his Wife* fetched 5l. 10s.; the famous portrait of *Rembrandt leaning on a Stone Sill*, a somewhat damaged impression, 11l. 15s.; a very late state of the *Rembrandt Drawing*, 3l. 10s.; and *Christ Healing the Sick* (the hundred guilder print), described as a "brilliant" impression of the second state, only 10l. The entire sale lasted eleven days and produced a total of 3,704l. There were more than two thousand lots. The length to which the record of this sale has necessarily run obliges us to defer till next week mention of the Fitzwilliam Duplicates, which were sold a day or two ago.

NOTES AND NEWS.

SINCE the notice in last week's ACADEMY of the excavations made by the Archaeological Society of Athens at the southern base of the Akropolis, we have received the *Ἦρα* newspaper of June 19, which announces the discovery on that site of an inscription of very great historical interest. It is a decree recording the terms of a convention to be concluded between the Athenians and Chalcidians, after the successful expedition of Perikles to Euboea, B.C. 445. The treaty consists of two parts; in the first part the Senate and dikasts of Athens swear not to drive the Chalcidians out of Chalcis, nor to subvert their city, nor to molest or injure any citizen of Chalcis by depriving him of life, liberty, or property without the proper legal trial, nor to vote against either the city or any individual without giving them due notice and free access to the Senate and People of Athens, provided the Chalcidians are obedient to the People of Athens. The Chalcidians, on their part, swear not to revolt against the People of Athens; to denounce all who are disaffected; to pay the tribute; to be their faithful allies. This oath is to be taken by all adult male citizens of Chalcis, and whoever refuses to take it will forfeit his goods, and a tenth of them will be dedicated to the Olympian Zeus. Then follow other provisions about certain persons who are to be exempted from payment of tribute, sacrifices ordered by oracles to be made on behalf of Euboea, &c. This inscription should be studied in connexion with a fragment of a treaty of the same epoch (Newton and Hicks, Greek Inscriptions in Brit. Mus. No. IV.), which regulates the relations between Athens and the Kleruchs occupying the territory of the Hestiaeans in Euboea.

At the present time, when questions of art administration are beginning to attract attention, we may turn with interest to the report prepared by M. Edouard Charton upon the Direction des Beaux-Arts in France. This report forms one of a series of official documents upon the different administrative services. It deals partly with the history of art administration, and partly with the future conduct of the department, and in both sections it presents much that is instructive, not merely for France but for any country where the question of Government intervention in art matters has to be discussed. No branch of the public service, remarks M. Charton, has suffered so many changes as that of the Fine Arts. Under the old régime it was included in the department for the control of the royal buildings, and afterwards, when it was no longer connected with the management of the royal household, it was attached to the Ministry of the Interior, which was at first divided into three sections. This arrangement was substantially maintained till the year 1832, when the administration of the Fine Arts was transferred to the Department of Commerce and

Public Works; but in 1834 it was again placed under the control of the Ministry of the Interior. From 1840 to 1846 the service of the Fine Arts gradually increased in importance. It was divided into four bureaux, which remained under the Ministry of the Fine Arts till the year 1853, when they were transferred, and made a section of the Ministry of State. But the most retrograde step was made in 1864, when the entire service was taken away from the Ministry of State and made a part of the household of the Emperor. This state of things continued until the year 1870, when the Emperor issued a decree briefly announcing the fact that "the Ministry of Fine Arts is henceforth separated from the Ministry of our household;" and later on in the same year the department of the Fine Arts was placed under the control of the Ministry of Public Instruction. M. Charton having thus traced the history of the department, proceeds to discuss the more important questions of its present organisation. Before doing so, however, he raises a preliminary enquiry as to the department of Government under which the Ministry of Fine Arts should properly be classed. There are, he declares, only three main divisions in the different functions of Government: (1) those which pertain to the internal and external security of the kingdom; (2) those which concern the physical welfare and prosperity of the country, such, for example, as the administration of the finances, of commerce and public works; (3) those which have for their object the cultivation of the intellectual forces of the people. Accepting this classification, he unhesitatingly places the administration of the Fine Arts in the last division, and there is no need of argument to show that it comes more appropriately under this heading than under that of the Royal Household, or the Ministry of the Interior. With us, of course, the same principle is recognised, but not to the full extent. South Kensington is under the control of the Council of Education, while the British Museum is nominally included in the Civil Service; while the Royal Academy, so far as it can be said to have a public existence at all, occupies a position corresponding to that held by the Administration of the Fine Arts in France when this department was included in the management of the Royal Household.

In his survey of the present constitution of the department M. Charton comments, in the first place, upon the undefined scope of the authority and influence accorded to the Director of the Fine Arts. What may be the measure of this authority is partly determined by the decree of December 27, 1873, creating a Conseil Supérieur des Beaux-Arts, by whose deliberations the director is assisted in his labours. This council, composed of distinguished artists or amateurs, some of whom are members of the Institut, meet every month on a fixed date to tender their advice to the director upon all questions concerning the advancement of the Fine Arts, whether as regards public exhibitions, artistic education, or the acquisition of works of art by the nation. Proceeding to test the vitality of the department by an examination of the manner in which it exercises these several functions, M. Charton reports: (1) that in respect to artistic culture both the encouragement offered to the artist and the means of instruction afforded to him are too exclusively confined to the capital. The buildings of the provincial towns remain without decoration, while large sums are expended upon the buildings of Paris; and, on the other hand, there is need of some further extension of the system of art instruction in the public primary and secondary schools. Passing to the consideration of the arts in their relations with industry, M. Charton finds that France is here in danger of being passed in the race by other countries, and England is specially mentioned as illustrating progress in this direction.

"No one," he writes, "can any longer be ignorant of

the zeal and munificence which are shown in the establishment of industrial museums of art in London and the principal towns of the North, since the great exhibitions where the different nations have measured their forces in the industrial arts. A French visitor to England cannot see without a feeling if not of envy at least of emulation the Museum of South Kensington, at London; the National Museum, at Munich, the Austrian Museum, at Vienna, and the Museums at Moscow and elsewhere."

The remainder of the report is devoted to questions of internal organisation, and M. Charton concludes in the name of the commission by offering certain recommendations for the future guidance of the department, which recommendations are partly anticipated in the body of the report.

THE mania for "reorganising" public galleries has to a slight degree possessed the authorities of the Hague. Many old favourites in the Mauritshuis have had to change their places on the walls, and the disturbance has been great enough to make a new catalogue necessary. The cause is the removal of the magnificent collection of Chinese porcelain and curiosities to a separate house on the Vijjoerberg, which has put four or five more rooms on the ground-floor at the disposal of the director. Some fresh pictures have been bought, and several have come out of the warehouses in which till now they have been stored. Among these the chief is a really fine Martin van Veen (commonly known as Hemskerck)—a large sacred picture in two compartments with double faces. One front represents the Annunciation; the other the two Adorations, of the Magi and of the shepherds. The work as a whole makes one think more highly of Hemskerck, who would have been a great painter if he had lived fifty years earlier, or if he could have abandoned himself entirely to his native inspiration. As it is, his Virgin is like a Virgin by Memling, with the draperies and the pose of Michel Angelo. Hemskerck travelled in Italy, and was spoilt rather than helped by what he learned there.

FROM some correspondence in the *Manchester City News* it would appear that the Decoration Committee of the Manchester Town Hall have serious thoughts of applying to MM. Guffens and Swertz, the Belgian painters, to embellish some rooms—in much the same style of art, we presume, as that which these artists have adopted in a large new church in Antwerp. Anything more disastrous than this result at Manchester could scarcely be imagined. The Flemings have very seldom been successful in mural decoration; and, what is more to the purpose, MM. Guffens and Swertz have been most unsuccessful. The writer happens to have examined last summer, to the cost of his patience, the works of these two painters, boundless in area as they are in common conventionalism. The quantity of work achieved would seem to indicate their executing rapidly; the thirty huge pictures, containing perhaps from five to eight hundred figures, often of colossal proportions, would, as regards quantity, have done little discredit to the combined lives of Raphael and Michel Angelo. But of the quality, all we will here say is that we trust the like—so pretentious, so hard, so hidebound and ironbound—will never be permitted to deface the walls of any English building. "Countrymen, countrymen," as Blake pathetically exclaimed on some occasion more or less similar, "do not suffer yourselves to be deceived!"

A LARGE new Salle is to be opened before long at the Cluny Museum to contain the numerous collections which have been bequeathed to this museum and otherwise acquired during the last few years, and which are at present stowed away from want of space for their exhibition.

AN appeal has been made for aid in the establishment of evening drawing and modelling classes for workmen at the Royal Architectural Museum

in Tufton Street, Dean's Yard, Westminster. Sir Gilbert Scott, R.A., has written an excellent handbook of this museum.

THE French papers announce the death of the distinguished sculptor M. Bosio.

Among the objects recently found in the excavations at Rome are a large block of amethyst, numerous amulets in the form of animals, a bag of chalcidony, thirty-one stone coffers containing iron weapons, a woman's head, life size, well modelled in terra-cotta, on which are traces of painting, and a little statue in Greek marble representing the figure of a man lying down asleep, with his head covered with a *paenula*.

An exhibition of the pictures, statues, and other works of art, commissioned by the Municipality of Paris for the decoration of public buildings, is open this week at the Ecole des Beaux-Arts. Beside the pictures, &c., acquired last year, several works of sculpture from the Salon of this year are exhibited. Among these may be noticed a marble statue of *Cain* by M. Caillé; *The Charmer*, a plaster cast by M. La Vingtrie; and *Le Joueur de Billes*, a fine marble by M. Lenoir. Several important paintings of older date taken from the churches and municipal buildings of Paris also form part of this exhibition. It seems that it is the intention of the Administration of Fine Arts to bring forward every year a certain number of these works, which are apt to be forgotten in the churches and other places to which they belong, and which are often found when removed to be in great need of cleaning and judicious treatment. Two large ex-voto paintings by Largillière and Troye from the church of Saint-Etienne-du-Mont, and an entombment by Salviati from Sainte-Marguerite, are the principal works chosen this year.

THE STAGE.

O'KEEFE'S "WILD OATS."

THE manager of the Haymarket has this week revived *Wild Oats*, one of those old-fashioned comedies which make their appearance on hot nights of July, when sultry weather and a bad play have combined to empty a theatre, and the uncritical cousin who is in town between hay and wheat harvest can alone be compelled to come in. O'Keefe's comedy and pieces of its kind have, indeed, a literary interest of a sort, but that is slight, and is soon exhausted. The power of attraction in the piece—such as it is—must in the main be assigned to its bustling intrigue, and to the fact that not the wildest expedient is neglected by which a laugh can be raised. The characters and the incidents have so little in common with those that pass around us that it is by anything rather than by the holding of the mirror up to Nature that such a play can succeed. The adventures of the characters and the positions in which they are placed are amazingly difficult of belief; and the funny people, of whom there are several, are only funny if you look at them as in a world of their own. They are not successful exaggerations of the types they profess to depict.

Wild Oats is too many-themed a drama to be put into three acts. It is either a comedy in five acts or a farce in one; that is to say, the leading fancy may have materials for a very rattling farce, or the complete plot should be presented with the usual length needed for its development. Presented as it now is, it is difficult to seize, and hardly worth the seizing. It can be best enjoyed by those who are carried away on the stream of its fun. But at their peril they must not reflect. The fabric perishes at a touch. High animal spirits and the audacity of distortion take the place of real inventive power and of the perfection of mechanism.

The story revels in improbabilities, of which one of the least is that two runaways who do not know that they are cousins, but who become

warm friends, join the same company of players, only to separate, to meet again in a house where the uncle of the one man is found to be the father of the other, and the husband of a lady who, to his astonishment, now for the first time appears. With the main theme demanding that strain on our credulity, the lesser incidents are not likely to be more life-like, nor the characters to be fashioned after the truth. The lesser incidents include, first, the brutality of a farmer whose villany is discovered by his refusing to a wayfarer shelter during a rainstorm—which the mechanical contrivances behind the stage of the Haymarket do indeed but ludicrously imitate—and secondly, the humanity of the "poor cottager" of romantic drama, whose hospitality is necessarily limited to the administration of currant-wine; and thirdly, the generosity of the wayfarer who, in return for draughts of that exhilarating beverage, bestows the whole of his estate upon the cottager, who happens to be not only a cottager but a debtor, and not only a debtor but an honest debtor.

The characters are not much mixtures of good and evil. They represent the virtues and the vices, and there is no mistaking them. The virtues are personified by the farmer's son—the lad Sim, who even at the bidding of his father declines to remove his neighbour's landmark—by the cottager who would seem to be in perpetual attendance immediately behind the door of his cottage to bestow upon every comer, at the first opportunity, a welcome and currant-wine; and by the Lady Amaranth, who has become the Quakeress Mary for the nonce, and who, as the Lady Bountiful of the country-side, not only relieves the destitute, which is one thing, but lets the destitute ride beside her in her carriage, which is another. And the vices are represented by one Ephraim Smooth, Mantegna-like in his expression of greed and lust; by the farmer who oppresses the poor; and by his daughter, a bold hussy who will never cause her sire to utter the apprehensive words of the Sir Giles Overreach that he resembles:—

"Should the foolish girl prove modest
She may spoil all; she had it not from me,
But from her mother."

The characters, therefore, it is plain, are wholly conventional: the talk of certain seafaring men—Sir George and John Dory—is a compound of nautical similes such as have amused the pit any time since the humours of the British sailor have been held worthy of illustration on the stage. And the public is slow to be persuaded that the sailor does not always hint at common things by nautical similes. The Naval Commander is conventional: his neglected wife—a shadow—is conventional too. Nor does it need a very intimate acquaintance with Quaker life and character to show that the Quaker-scenes have nothing of the merit of recognisable caricature. The Quaker-dress is not quite faithfully copied by the actors; but that is a small thing—the greater is that the author himself, working absolutely from the outside, has produced not a permissible caricature of Quakerism as it was in his own day, but a gross and clumsy and constantly halting invention, which has no likeness to Quakerism whatever—it may have a little more to common Puritanism, but in that only of course to the ugly side, which, with natural revenge for the treatment which Puritanism gave to the stage, the stage delights in.

One of the few parts which still affords some occasion for fun is that of Rover, the young player, who knows the dramatists by heart, and speaks their language. It is played by Mr. Charles Harcourt, not indeed as a consummate light comedian might play it, but with spirit and understanding. The second runaway is played naturally by Mr. Kyrle. The good lad Sim—who, after all, is the one bit of nature in the play—is represented by an actor new to us, Mr. William Younge, who displays to the full his heartiness and his rough good nature. The actor who plays the theatrical manager, and appears only for a few minutes, has

a touch of the last century's ceremonious courtesy. Sir George Thunder, the naval uncle who is looking for a nephew and finds a son and a wife, is played by Mr. Howe very tediously and monotonously. It is the misfortune of a "useful" actor like Mr. Howe that he gets used in characters of which he cannot be a fitting exponent, even more than in the parts which are properly his own. Miss Henrietta Hodeson appears as the Lady Amaranth, with the quietness and demureness and kindness suited to the character. The heroine of O'Keefe's play is allowed no scene of strong emotion. She is as passive as a French *ingénue*, and cannot be very interesting.

FREDERICK WEDMORE.

Mdlle. BEATRICE appeared on Saturday, as she was advertised to do, in *Frou-frou*, at the Globe Theatre. Her own talent and that of her company are alike remarkable for no conspicuous success and no conspicuous failure. If the public finds itself amused by the representation of plays which would be far better in the original French, no great harm is done by Mdlle. Beatrice and her company travelling round the provinces and coming now and again to London to give such representations. They cannot claim to be of special interest, and that they should succeed at all proves indeed something for the capacity of Mdlle. Beatrice and her troop, but more for the tendency of British playgoers to be drawn by the name of a thing and not the thing itself. Mdlle. Beatrice's translations, however literal, cannot succeed in planting the playgoer in French ground: one or two of her actors have acquired the gestures of the French, but generally there is the disagreeable sense that the foreign work is seen under unfavourable conditions. The action that passes before our eyes appears neither quite French nor quite English. *Frou-frou*, itself, the particular piece which Mdlle. Beatrice and her company have been playing during this week, has been criticised too often for it to invite much of further comment. That it presents us with a true and vivid picture of what a spoilt girl is likely to be, brought up by a father who boasts of journeys to "Bohemia," and married to a serious man who should have married her sister, may certainly be allowed. For that and for the interpretation at once bright and pathetic which Mdlle. Desclée gave to the character, the play became celebrated. It was thus fortunate; and more fortunate in this way than remarkable in others.

TO-NIGHT the *Danicheff* is withdrawn from the St. James's Theatre, and we shall be the losers by the cessation of a performance not only more equal but in many places more brilliant than those to which we are accustomed. Messieurs Maseet, Marais and Porel, and Mdlle. Petit and Mdlle. Fargueil carry their admirable art into some French towns and watering-places. At the fag end of a tiresome season their appearance in London has been a great refreshment.

A LONG farce by Mr. Byron is announced for early performance at the Gaiety.

THE successful performances of *A Scrap of Paper* at the Court are drawing to an end.

MR. NEVILLE is playing in the *Ticket of Leave Man* at the Standard Theatre, and Miss Ada Cavendish will appear at that house on his withdrawal.

It is reported that Mr. Arthur Oecil and Mr. O. Sugden will go to the Prince of Wales's Theatre at the beginning of next season.

Corinne has had to be withdrawn from the Lyceum—Mrs. Fairfax's brief management has come to an end—and the theatre is closed until the Carl Rosa Company take possession of it in September.

MR. H. B. CONWAY will, in the early part of next season, be a welcome addition to the company at the Court Theatre, it is said.

At Mr. Henry Neville's Benefit last Saturday night he made a speech of the frank and confidential kind now fashionable with leading actors. He had had successes, he said, and he had had failures. *The Ticket of Leave Man* had been his best friend. Next season he would bring out the *Duke's Motto*, which was one of Fechter's chief successes at the Lyceum. There were also other promising revivals.

MUSIC.

THE tenth concert of the Philharmonic Society, given last Monday evening at St. James's Hall, brought the present series to a conclusion. The chief interest of the evening centred in the performance by Mme. Essipoff of Chopin's Concerto in E minor. It was with this work that the talented pianist two years ago made her first appearance in London, and there is certainly none in which she is heard to greater advantage. Her playing on Monday was fully worthy of her high reputation. The orchestral pieces of the evening were the "Eroica" symphony and the two movements of Schubert's unfinished symphony in B minor. Miss Emma Beasley was the vocalist in the place of Mme. Edith Wynne, who was prevented from singing by illness; and the concert concluded with Weber's *Jubilee* overture, concerning which it is surprising to find so well-informed a musician as Prof. Macfarren repeating in the analytical programme the so often disproved statement that the overture in question is that of the "Jubilee Cantata"—an entirely different work. In looking back at the season now concluded, it is impossible to speak with any great enthusiasm of the results achieved. We have had, it is true, an opportunity of hearing the splendid "Deutsches Requiem" of Brahms; but except this there is very little to be thankful for. Of the few novelties originally promised in the prospectus, two of the most important (Hofmann's "Frithjof" symphony, and Raff's symphony in C major, No. 2) have not been given; while the two new works by Rubinstein which were brought forward can certainly not be considered a compensation. The neglect of English music and musicians which appears characteristic of this society has been this season as marked as usual; the only English names which have appeared in the instrumental part of the programmes have been those of Sterndale Bennett and the Philharmonic conductor, while among the ten instrumentalists who have appeared there was not one who was not a foreigner. Such facts speak for themselves; comment is as needless as it is unpleasant.

A SERIES of Summer Evening Promenade Concerts is announced at the Alexandra Palace, to be given every evening, commencing at 7 or 7.30 p.m. A special orchestra is erected in the centre of the central hall, and the band of the company will be increased to 130 performers. The programmes are to include overtures, operatic selections, dance music, &c., as well as songs and ballads by popular vocalists, besides part-songs, &c., by the Alexandra Palace Choir, which is to be augmented to 500 voices. Special trains will be run to all parts after the concerts for the accommodation of visitors, and it may reasonably be anticipated that these Summer Evening Concerts will prove formidable rivals to the Promenade Concerts usually given at this time of the year. The musical arrangements will be under the direction of Mr. Weist Hill, the conductor of the Company's band.

THE programme of the Festival of the Three Choirs, which this year takes place at Hereford, has been issued. The date fixed is from September 12 to 15, and the chief works selected for performance are *Elijah*, *Samson*, the first part of the *Creation*, *Sophy's Last Judgment*, Mendelssohn's *Lobgesang*, J. F. Barnett's *Raising of Lazarus*, and the *Messiah*. The band will be led by M.

Sainton, and Mr. Townshend Smith, the organist of Hereford Cathedral, will conduct.

WEBER'S *Freischütz* was revived at the Paris opera last Monday week, the 3rd inst. The *mise-en-scène* is said to be more remarkable than the performance of the music, in speaking of which M. Adolphe Jullien, the critic of the *Revue et Gazette Musicale*, is very severe on the liberties taken by the chief singers with Weber's text.

Le Roi de Lahore, an opera in four acts by M. Massenet, has been accepted for performance at the Opera, Paris, and will probably take the place of Gounod's *Polyeucte*, which (as recently mentioned in these columns) has been withdrawn by its composer.

MANY of our readers will remember M. Hasselmans, whose excellent conducting contributed so largely to the artistic success of the French opera performances last summer at the Gaiety. At the time of the recent destruction by fire of the Théâtre des Arts at Rouen, he was conductor there. He has now been appointed director of the Conservatoire at Marseilles.

ONE of the most distinguished German musical historians and critics, Dr. A. W. Ambros, died at Vienna on the 28th ult., at the age of sixty. Ambros was born at Mauth, in Bohemia, and was a nephew of Kiesewetter, author of a well-known history of music. He was one of Schumann's collaborators on the *Neue Zeitschrift für Musik*. His principal works are the series of essays entitled "Culturhistorische Bilder" and "Bunte Blätter," and a "History of Music," which his death has unfortunately prevented his completing, only three volumes being at present published.

THE German musical papers are at present full of details concerning the Bayreuth rehearsals, which are now in full progress. So far as can be as yet judged, the artistic success of the performances appears likely to surpass the most sanguine expectations. It has been decided that no free press admissions whatever can be issued, as the event is of such European interest that the large number of applications has rendered it quite impossible to comply with them.

LITERATURE.

Eight Months at Rome during the Vatican Council. By Pomponio Leto. Translated from the Original. (London: John Murray, 1876.)

THE special interest of this remarkable volume, over and above its unquestionable ability, lies in the circumstance, noticed by the translator, that it is not only "the work of a sincere and liberal Roman Catholic, inspired by a genuine desire to promote the welfare of that religion," but also that "the writer had peculiar means and opportunities of closely observing the incidents which he depicts;" or, in the words of the Italian editors, which are much stronger in the original than in the English, "that the author was an eyewitness of all he relates is beyond doubt, as the book itself proves." The author himself says in his Introduction that he has only recorded that of which he was a personal witness or which he received on authority of equivalent value; and he elsewhere speaks of its being "impossible for a person not an eyewitness" of what took place in the Council, to understand the feeling it conveyed of utter isolation from the rest of the world. It is, in fact, an open secret that the author derived his information on these points from the late Cardinal Vitelleschi, who took part in the Vatican Council as Bishop of Osimo, and kept a copious diary, which he placed at the disposal of his brother the Marchese, under whose roof he was residing, and who prepared this volume for the press and edited it. We understand that when the original work, which appeared more than two years ago, was brought under the Pope's notice, although he naturally did not like it, he refused to have it placed on the Index. All this gives a peculiar importance to the statement of facts contained here; and there is the more reason for insisting on this because the writer confirms with singular emphasis and precision the very points which have been most sedulously and indignantly called into question by those professing to be well informed, and notably confirms in the minutest details, so far as we have been able to observe, the accuracy of the *Letters of Quirinus*, while he adds, as might be expected, several graphic touches of his own as to what occurred within the Council Hall. And it is this "simple chronicle" of events, divided according to the months during which the Council remained in session, which constitutes the speciality of the volume, though the chapters where the author enters more fully into an exposition of

his own views—especially that on the "Condition of the Catholic Nations" and the "Conclusion"—have a very high interest of another kind, which is largely increased by the origin and circumstances of the publication. There is also a valuable appendix of official and other documents, some of which may be found in the *Letters of Quirinus*, and others in Friedrich's *Documenta*, but which it is handy to have collected here in a readily accessible form. We cannot do more within our present limits than briefly notice the salient points of the volume, but a word must be said on it in its double aspect, as both a record of opinions and of facts, so far as the two can be discriminated.

There is not much that will be absolutely new in the way of information to those who are familiar with *Quirinus*, but they will find many of the same facts stated afresh, often more fully, and regarded from much the same point of view. Thus at the very outset the author remarks on the number of titular prelates in the Council, who had no cure of souls, and therefore lacked "that practical knowledge and sense of responsibility required to render their vote disinterested and valuable," and were entirely "devoted to Roman interests;" and he frequently recurs to the point afterwards. So, again, he speaks of the acoustic qualities of the Council Hall being designedly "inimical to discussion;" of the invitation to Easterns and Protestants being so worded as to court a refusal; of the previous silence as to the matters for discussion studiously maintained by the authorities at Rome, even towards the Bishops themselves, who were thus "left in complete ignorance" of what was coming before them; of the real object of summoning the Synod being the authentication of the Syllabus, the Assumption, and, above all—what it is worth observing that he always calls—"the personal Infallibility," or "the apotheosis of the Pope;" of the great influence exercised by the *Civiltà Cattolica*; of the very prominent part taken in securing the triumph of the infallibilist dogma by Archbishop Manning—who, in spite of "having been in error the first half of his life," is said to have been its "author and originator;" to be actuated by "immoderate restlessness," and destitute of "real Catholic perception;" to be with his English suffragans "more Catholic than the Pope himself," and to have joined in a scheme for settling the matter out of hand by "declaring the whole of the Opposition excommunicate and out of the Church;" and who on the day the dogma was promulgated received a solemn acknowledgment of his services from the Jesuit staff of the *Civiltà*. Thus, again, the author makes the same complaints as *Quirinus* about innovations on the Tridentine model in the order of proceedings, the unfair and onesided selection of the different Commissions, and the form of the decrees, "Pius Episcopus, sacro approbante Concilio;" about "the moral violence of every sort adopted against the Opposition;" the contemptuous and insolent conduct of the majority, and their promises of "universal peace for the conscience," which reminded him of "L'ordre règne à Varsovie;" the blasphemous utterances of some of its individual mem-

bers, who, e.g., almost identified "the Grotto of Bethlehem, the Shrine, and the Vatican;" and the attempts to shake the constancy of the martyred Archbishop Darboy by the offer of a Cardinal's Hat, who eventually "disappeared unregretted and unwept from a world that was unworthy of him." These are but a few of the points, too numerous even to specify here, in which this volume unequivocally endorses the testimony of *Quirinus*. One or two more of the kind may be mentioned on account of their crucial significance and the confident denials which have been hazarded by persons claiming to speak with authority. Such are: the strange demeanour of the Pope towards the aged Chaldean Patriarch, who was summoned to his presence and ordered either to retract his opposition or resign his office; his equally strange conduct about the Requiem Mass for Montalembert; his startling assertion to Cardinal Guidi, "I am Tradition," and his threat to imprison the Vicar-General of the Armenian Archbishop, who had to appeal for protection to the Turkish Minister; the repeated attempts to carry the dogma by a surprise or by a *coup d'état*; the wonderful speech of Bishop Piè, who undertook to prove it from St. Peter being crucified head downwards; the fierce "uproar" in the Council Chamber on more than one occasion, as during the speeches of Strossmayer and of Cardinal Guidi, when "the Presidents quite lost their temper," and the infallibilist fathers gathered round the tribune and shook their fists in the speaker's face. These and many kindred allegations of previous writers which have been hotly contested are now deliberately reaffirmed on the authority of a member of the Council, who was subsequently raised to the purple. Some additional instances are given of the pressure exercised to procure the definition—as e.g., that, when the parish priests of Rome had decided not to petition in favour of it, "the authorities immediately intervened with all their force" and made them do so. These are but a few specimens of a narrative which has the strangeness, though scarcely the charm, of a fairy tale, while for all who are concerned about the future of Christianity, and especially of Catholic Christianity, it must inevitably possess a far deeper and more painful interest.

But it is time now to turn from the record of facts to the author's judgment upon them, so far as it can be gathered from these pages. It is only natural that he should express himself with caution, and should disclaim the intention of meddling with theology as such. But still his estimate of the objects, conduct, and issue of the Council is made so plain that he who runs may read. This is, indeed, evidenced clearly enough, as our readers will have already observed, in his way of narrating the history. It is insisted that one aim constantly kept in view throughout by those who originated and carried out the programme was the assertion of "the personal infallibility" of the Pope; but the author thinks that they ought to have directed their efforts to a very different end. "The question at stake was to decide whether the Catholic nations of Europe are or are not to have a religion." His view of the relative position of the

doctrines of ecclesiastical and Papal infallibility is intimated not obscurely in the following significant passage:—

"The infallibility of a single man is a more striking miracle, and a greater infraction of the laws of nature, than the infallibility of a large and well-organised assembly under the security of a strong and severe discipline; it is much more so, because the infallibility of society with regard to itself is by its very nature relative, while that of an individual towards society cannot be other than absolute. It is reasonable to believe that God protects the Church, as we believe that God protects the world, and that the Church in her own office should be infallible may be in a certain sense reasonable; but that God should take away from an individual man the liability to error, which is characteristic of humanity, would be an absolute and standing miracle. In the first case Faith allies herself with reason; in the second she subdues it" (pp. 34, 35).

But he regarded the proposed definition as a matter of vast practical moment, though not exactly in the same sense as its advocates. He held that the triumph of the majority would determine that "most of the States at present Catholic would cease to be so in fact, and with them a large number of the noble and intelligent minds who hitherto had remained within the bosom of the Church." And when the end was drawing near he spoke of it as "the final combat, in which was to be irrevocably decided the fate of the Catholic Church, the most serious struggle in which she had ever been engaged." He considered with *Quirinus* that the assertion of the supreme ordinary jurisdiction of the Pope would reduce the bishops to mere "official delegates." He thought that Catholic nations would cease to regard the Council with any attention when they saw it "occupied only in building up a perplexing and questionable apotheosis" instead of grappling with the real problems of the age, while the true mission of the Church is to seek rather to enlarge than to narrow and restrict her limits. And as to the Syllabus, it "confuses the evils of a system with the system itself, and passes judgment on a whole category of facts only some of which are really reprehensible: as if we were to say 'thirst is wrong, because it leads to inebriety.'" The contrast drawn out in detail between the condition of Catholic and Protestant nations is very suggestive as coming from such a quarter. The writer attributes the evils he deplores mainly to an excessive exaggeration of the principle of authority in Catholic, and especially Jesuit, education, which again provokes a recoil "into the wildest revolutionary excesses." And hence it comes to pass that "frequently in Catholic societies religion hinders the advancement of the nation." But we must refer our readers to the chapter itself for a further account of the author's comments on this subject, which we should be disposed ourselves to supplement by reference to the weighty consideration dwelt upon in Dr. Newman's *Apologia* as to the serious loss, moral as well as material, suffered by the Church at the Reformation, when the Catholic became virtually identified with the Latin nations of Europe. Our author evidently fears that this "circumscription," as Ranke calls it, will grow narrower still:—

"The very name of 'Catholic party,' which the

devout Catholics of all countries have spontaneously assumed, seems to be a forecast of the future, and to indicate the opinion of those who have given up the universality of their kingdom, while it points out the probable condition of the Church of Rome in its laborious struggle with modern society."

In a concluding chapter, the longest in the book, the author dwells in a tone almost of despair on the religious prospect of the future. He sees alike in the submission of the bishops to the Vatican decrees, and in the resistance of the Old Catholics, "a forlorn resignation, which almost assumes the character of a passive resistance," while the inferior clergy are "reduced to mechanical rather than intelligent members of the Church," and the triumphant party—Dr. Newman's "insolent and aggressive faction"—rejoices over every fresh desertion, "preferring to see the number of the faithful constantly diminished rather than to recognise as such any who are not completely and blindly submissive." Meanwhile, as to those who remain, "Catholics at the present day very often neither have nor profess any religion whatever," and instinctively "draw closer to those confessions of faith which tend most towards rationalism." But here again we must refer our readers to the chapter itself, which they will find well worth a careful perusal. On one point we are hardly prepared to follow our author, if we rightly understand him, when he urges that it would be detrimental to the Church if the Papacy ceased to be Italian—meaning apparently exclusively Italian. Not to speak of several of the earlier Popes being Greeks, he surely cannot have forgotten that the great "reformation of the eleventh century," as it has been called, was mainly effected through German influences, and that some of the best popes, like Adrian VI., have been foreigners. But this is a mere *obiter dictum*, and in nowise affects the general argument of a book which would possess a quite exceptional interest if it had nothing to rely on but its own intrinsic merits, and has a still further claim on the attention of all thoughtful observers of the present phenomena of Christian society from its close connexion with one of the ablest and most highly cultured of the Roman Cardinals of the day, who used to be spoken of in his lifetime as not unlikely to be the successor of Pius IX. The translation, on the whole, is a good one, but strange inaccuracies, either in writing or correcting the press, occur not unfrequently. Why should Father Hyacinth be metamorphosed into "Father Giacinto," Mermillod into "Monsignor di Ginevra," and Maret, Bishop of Sura, into "the Bishop of Sens?" Who, we may also ask, is "Monsignor Scissmor?" At p. 201 "Haymald" is named instead of Hefele; and it is simply a mistake, though not one for which the translator is responsible, to speak of De Mérode as a "leader of the Opposition." Then, again, we have such barbarisms as "De Potestate Temporale," and a doctrine "proxime fidei," and are told that Fabius "cunctando restituant rem." But these are mere surface blemishes, which will easily be corrected in a second edition.

H. N. OXENHAM.

The Marriage, Baptismal, and Burial Registers of the Collegiate Church or Abbey of St. Peter, Westminster. Edited and Annotated by Joseph Lemuel Chester. (Printed for the Harleian Society, 1876.)

THE volumes hitherto published by the Harleian Society are interesting only to a limited circle of antiquarian readers, but the registers of Westminster Abbey have a world-wide interest, for they abound with names which are honoured and familiar wherever the English language is spoken. The handsome volume now lying before me is not a mere list of names, however illustrative, for every page is more than half filled with notes, in which the editor has worked out the history of the persons named in the register with marvellous accuracy and minuteness. His information is mainly derived from wills, marriage-licences, and other unpublished authorities, which enable him to correct on almost every page statements hitherto accepted without challenge in standard books of reference. The amount of time and labour which has been expended on such a work can only be appreciated by those who have attempted enquiries of a similar kind, for, as the editor says in his preface, "there is many a line and half line which is the concentrated result of weeks of patient research." For this important contribution to the materials of English biography the Harleian Society is indebted to Colonel J. L. Chester, an American gentleman resident in London, whose genealogical collections are so widely known that of late years few books of genealogy have been published in England or America in which the assistance derived from them is not gratefully acknowledged. He discovered some years ago that the extracts from the Abbey registers printed in the *Collectanea Topographica et Genealogica* by the late Sir Charles Young, Garter, were so full of errors, both in the text and notes, as to be worthless for historical purposes. He thereupon transcribed with his own hand the whole of the registers down to 1875, and has devoted several years to the labour of identifying the persons named in them. His arrangements for publication were interrupted by the death of Mr. J. G. Nichols, when he liberally permitted the Harleian Society to print an edition exclusively for their own members.

Considering the rank and importance of the persons who were married, christened, or buried at the Abbey, it is surprising that the registers should have been more irregularly kept than in many obscure country parishes. The earliest existing register was compiled after the Restoration by the zeal of Philip Tynchare, Precentor of the Abbey from 1660 to 1673, who prefixed this heading:—

"The Register of the Collegiate Church of Westminster of Weddings, Christenings, and Burials; such as could be found in imperfect books, and such as have been carefully taken notice of since the happy restoration of His Majesty King Charles the Second; by Philip Tynchare, Chaunter of the said Church."

The baptisms and burials begin in 1607, and the marriages in 1655. Before these dates they are lost beyond recovery, and the existing registers (especially before the Re-

storation) are constantly deficient and inaccurate. "These discrepancies have been reconciled by the editor whenever positive evidence could be obtained." In these corrections he displays considerable learning and ingenuity. For example, the third entry in the Burial Register records the interment of "Mary, daughter of King James," on December 16, 1607, and the same date is stated on her monument in the Abbey as the day of her death. But Col. Chester proves by a *catena* of evidence that there is an error of three months in these dates, for the Princess really died on September 16, and was buried on September 23. It might have been expected that the burials of the King's children would be accurately registered. But Charles Prince of Wales is said to have been buried on May 13, 1629, and his sister, the Lady Anne, on December 8, 1640, whereas these were the days respectively of death and not of burial. Their sister Catherine, who was born and died January 20, 1638-9, and is known to have been buried in the Abbey, is not mentioned in the register. "Richard Hackler, Prebendary of this church, buried November 26, 1626," is identified with Richard Hakluyt, the famous collector of voyages and discoveries, who died November 23, 1616. His burial, therefore, is post-dated ten years in the register. Camden, the antiquary, was buried on November 19, 1623, and not on November 10, as the register states. In the entry "Dr. Lee, buried September 21, 1645," Colonel Chester discovers the fate hitherto unknown of Dr. William Leo, *alias* Loe, sub-dean of Gloucester, the ingenious author of verses composed exclusively of monosyllables, which were reprinted in 1871 by the Rev. A. B. Grosart. It is related of Dr. Loe that, having to preach in a church near London in the morning where Mr. Adam was going to preach in the afternoon, he chose for his text, "Adam, where art thou?" to which Mr. Adam responded in the afternoon by preaching from the text, "Lo, here am I." "1707-8, January 22, Mr. Christian Fox buried." This should be *Mrs.* Christian Fox, the twin sister of the first Lord Holland, who was born September 28, 1705, and tumbled out of the window on January 20, 1707-8. Colonel Chester adds that her mother, the second wife of Sir Stephen Fox, is wrongly described in all the peerages as Christian, daughter of the Rev. Charles Hope, of Nasely, county Lincoln. The error is an old one, for it appears in a pedigree in the College of Arms, which is signed by Sir Stephen himself. But there is no such place as Nasely in Lincolnshire, and there was no clergyman of the name of Charles Hope at that period. Lady Fox was the daughter and co-heir of the Rev. Francis Hopes, rector of Haceby, and afterwards of Aswarby, both in Lincolnshire, who died March 13, 1704-5.

The omissions from the registers are serious and frequent. The burials of Ben Jonson and Old Parr and others can only have been omitted from sheer neglect; but there is good reason to suspect that other entries were wilfully suppressed after the Restoration by some over-zealous Loyalist. "Else," asks Colonel Chester, "why do we fail to

find the name of a single member of the Protector's family? Yet Cromwell himself was buried in the Abbey, as were his mother, his sister, his daughter, his son-in-law, and his grandchild. Why do we also fail to find the names of Bradshaw, and Pym, and Strode, and Bond, and May, all of which appear in the Royal Warrant for disinterment in 1661, and of whose places of burial there must have been some record, as their coffins were readily found?"

On the other hand, "many persons have the historical reputation of interment in the Abbey for whom its gates were never opened." The monumental inscriptions cannot be trusted, for in many cases the monuments are cenotaphs of persons buried elsewhere, and *hic jacet* is often a mere synonym for *in memoriam*. Even the dates are often wrong, and the famous monument by Roubiliac of Lady Elizabeth Nightingale gives the year of her death as 1734 instead of 1731. It is curious that this error is neither detected nor corrected in the elaborate *History of the Shirleys*.

Several notes are specially devoted to refuting standing scandals of history. For instance, Robert Townson, Bishop of Salisbury (who was buried May 16, 1621), is said to have left his widow and her daughters in so great poverty that his wife's brother, Dr. John Davenant, was appointed to the bishopric on condition of providing for his nieces. But it turns out that Bishop Townson's widow bequeathed by her will considerable sums of money, and that Bishop Davenant speaks in one of his letters of her giving good marriage-portions with her daughters. Again, Stephen Marshall, the celebrated Presbyterian preacher (who was buried on November 23, 1655), is commonly reputed to have been the father of Anne and "Beck" Marshall, who were actresses and mistresses of Charles II. in 1672; but Colonel Chester shows that at the date of his will, in 1655, his wife was dead, and five of his six daughters were already married, and had children. His only unmarried daughter, Susan, was then more than twenty-one, for she proved her father's will. Again, the *Lady Alisbury*, buried in 1661 in the Hyde vault, is now identified with the grandmother of Anne Hyde, Duchess of York, for whom the Duke went into mourning in November, 1661, which Pepys calls "a great piece of fondness." The current story is that she was of very humble origin, and that Sir Thomas Aylesbury fell in love with her at the washing-tub. Her descendant, Lady Theresa Lewis, wrote in 1852, "it is not known from what family she sprang, or when she died." Colonel Chester proves that she was of gentle blood both on her father and mother's side, and that she was Anne, the eldest daughter and co-heir of Francis Denman, of West Retford, Notts, by Anne, daughter of Robert Blount, Esq., of Eckington, Derbyshire. Her only sister, Barbara Denman, married Edward Darell, Esq., son of Sir Thomas Darell, Knight, of Pagham, Sussex.

But if some scandals are exploded in these notes, others are dragged to light. The beautiful Countess of Grammont, Elizabeth Hamilton, has hitherto had the credit of being one of the few who in her youth resisted the temptations of the corrupt Court of Charles II., and in her later years

was a model of piety and devotion. But Lord Stafford, the husband of her daughter, gives a very different account of her in his will, which is dated February 2, 1699-1700. He says:—

"I give to the worst of women, who is guilty of all ills, the daughter of Mr. Grammont, a Frenchman, whom I have unfortunately married, 45 brass half-pence, which will buy her a pullet to her supper, a greater sum than her father can often make her, for I have known when he had neither money nor credit for such a purchase, being the worst of men, and his wife the worst of women, in all Debaucheries; had I known their character, I had never married their daughter, nor made myself unhappy."

Again, Joseph Dalby, apothecary, of Welbeck Street, was buried July 27, 1784. He was the inventor of Dalby's Carminative, and his will is "a literary curiosity, of which portions are unfit for publication."

The origin of Dr. William Paul, Bishop of Oxford, 1663-5, has hitherto defied curiosity. He was baptised at St. Leonard's, Eastcheap, October 14, 1599, being one of the sixteen children of William Paul, citizen and butcher of London, by Joan, daughter of John Harrison, beadle of the Butchers' Company. The bishop had three wives, all of gentle families, of whom only the third (Rachel Clitherow) is noticed in the recorded pedigree. Brian Duppa, Bishop of Winchester, was *not* the son of the Rev. Geoffrey Duppa, Vicar of Lewisham, Kent, by a daughter of the Rev. John Bungay, Prebendary of Canterbury; but his father was Geoffrey Duppa, Esq., of Pembridge, in Herefordshire, who married at Lewisham in 1580 Lucrece Maresall. "1674, October 23, Mrs. Stanhop buried." She is identified with Henrietta Maria Price, one of Queen Catherine's maids-of-honour, whose parentage and fate have puzzled all the editors of Grammont's *Memoirs*. She was the daughter of Sir Herbert Price, Knight and Bart., M.P. for Brecon, by Goditha Arden, and married, at St. Andrew's, Holborn, December 4, 1673, Alexander Stanhope, Esq., of the Inner Temple. It is probable that she died in child-bed.

The last note for which I can find space relates to the gallant and ill-fated Major John André, whose remains were brought from America in 1821 by command of the Duke of York. The editor expresses his surprise that so little should be known about his parentage, and has "devoted considerable time and labour to the subject." The major was born about 1751, the eldest son of Anthony André, merchant, of London, by Mary Louise, daughter of Paul Girardot, of Paris. Anthony was a native of Geneva, the grandson of John André, of Nismes, and was naturalised by Act of Parliament in 1748. He died at Hackney, April 14, 1769, leaving two sons and three daughters, who all died unmarried. His widow survived both her sons, and died at Bath in 1813, at the age of ninety-one. Her younger son, William, was created a baronet in 1781, in recognition of his brother's services, but the title became extinct on his death in 1802.

The editor has crowned his labours by a most useful index, which contains nearly 15,000 names. He has produced a book of permanent interest and value, and if we must suggest a fault it is that in some of

his notes the labour employed is out of all proportion to the importance of the enquiry. In the lives of illustrious men every detail is worth discovering and recording, but it provokes a smile when so much industry is bestowed on the domestic history of the college cook and the genealogy of beadies and bellringers.

EDMOND CHESTER WATERS.

The Comedy of the Noctes Ambrosianae. By Christopher North. Selected and Arranged by John Skelton, Advocate. (Edinburgh and London: William Blackwood & Sons, 1876.)

It was a fortunate idea to extricate from so much that was purely local, purely temporary, and often enough in ill humour, all that seemed permanently human in Wilson's *Noctes*. Few people nowadays would take the trouble to go through the fruit of these ten years of high-pressure literary action. Of the few who did so, most would feel a strange weariness and despair creep over them among these warfares of the dead. Bygone personalities have an odd smack of the grave; and we feel moved to turn the tables on the high-stepping satirist, and remind him, with something of the irony of country headstones, that not only they, but he—not only the rejected Whiglings, but the redoubtable Kit North—point the moral of dust to dust.

But of the more perennial part, picked skilfully from among this *detritus* of old literary and political convulsions, Mr. Skelton has erected what is perhaps the most durable monument to Wilson's fame that we possess. In it we find the immortal trio at their best throughout. From beginning to end, their meetings are inspired and sanctified by Bacchus and Apollo. North can always lay aside his crutch; Tickler is always six feet high; and the Shepherd is always the Shepherd. For how is it possible to praise that adorable creation but in terms of himself? He is the last expression of sophisticated rusticity; at once a poet, a journalist, a Scotchman, and a shepherd; oscillating between Burns and the *Daily Telegraph* in things literary; and, in things moral, occupying all sorts of intermediate stations between a prize-fighter and Peden the Prophet. If it were lawful to marry words of so incongruous a strain, we might classify him as a Presbyterian Faun.

And this book is not only welcome because it takes us on a visit to Wilson when he is in his best vein, but because Wilson, in all his veins, is the antidote, or at least the antithesis, of much contemporary cant. Here is a book full of the salt of youth; a red-hot shell of animal spirits calculated, if anybody reads it, to set up a fine conflagration among the dry heather of present-day Phariseism. Touch it as you will, it gives out shrewd galvanic shocks, which may perhaps brighten and shake up this smoke-dried and punctilious generation. Look at the profound animal sensuality, which breaks out in the praise of all sorts of exercise, and gloats, through near one-half the pages, over the details of eating and drinking. "O man," says the Shepherd to Tickler, "it wad be a great peety to dee wi' sic an appeet!"

Again, the Shepherd explains his own position immediately before dinner: "I'm nae glutton—nae gormandeezer—but a man o' a gude, a great appeet—and for the next half-hour I shall be as perfectly happy as ony man in a' Scotland." And those who can read the "towsy tea" in the snuggerly without an access of imaginary hunger must have something amiss with their digestions. Look at the grand inhumanity; see how they laugh over the two bagmen lost in the snow, for no better reason than that they were Cockneys, and wore false collars something delicately starched; or listen to them declaring that "any man may well lose patience to think of fools being sorry for the death of a fox." And then look at that curious and most Scottish enthusiasm which rages at large in all descriptive passages, and inspires such extravagant poetry and reasoning that one is never rightly sure whether it be in jest or earnest. Some of it is false fire, I dare say; but by far the most is the uncontrollable expression of the man's high spirits. If any other writer broke out into a fervent "Thank God that Nelson died at sea!" we should be not a little exercised as to his sanity; but in Wilson we like the extravagance, because we understand the man. And it all goes well enough with his copious and headlong style. For it is scarcely literature: at most, a sort of inspired talking, as it purports to be; and the fiction of Gurney the short-hand writer in the ear of Dionysius seems almost necessary to explain the existence of the book.

Wilson looked upon life with the positive acceptance of a man in excellent health; his heart never seems to have failed him over anything, however squalid or sad; but, squaring his elbows, he put it outside of himself in some easy and forcible pages. The man who wrote the Alderman's death (p. 220), or the Shepherd's commentary over the oysters (p. 121), was certainly of no very dainty stomach. But it was to this same unscrupulous catholicity of taste that we owe masterpieces (after their fashion) like the dog-fight in the Guse Dubs, the execution of the mutineer, or those scathing pictures of depravity with which the Shepherd silences some sentimental aspirations after the improvement of the species.

ROBERT LOUIS STEVENSON.

Studies in the Philosophy of Religion and History. By A. M. Fairbairn. (London: Strahan & Co., 1876.)

THE author has hesitated, he tells us, before deciding to collect these studies, which, as he says, "embody the results of much thought and not a little enquiry." We congratulate ourselves on his decision, though we are not surprised at his hesitation. He has given us much which is well worth having, but in a form which is less final than we could wish; it is not merely that the results are tentative, or that there is a certain amount of repetition, but the processes themselves are incomplete: the reader is embarrassed by recurrent attempts which are not carried through to isolate discussions which cannot be isolated, and by the habitual

use of unsifted conceptions, on which we shall have more to say hereafter.

The main scheme of the book is to show by example that the German investigations into the earlier history of "culture-folk" are a better foundation for an historical study of religion than the English investigations into the present condition of "nature-folk," even when these are supplemented, as they sometimes are, by references to parallel traits in the oldest traditions of "culture-folk," and more or less doubtfully supported by inferences from prehistoric archaeology. Now, there can be little doubt that among the half-instructed the views which Mr. Fairbairn combats have much more vogue than they deserve: they lend themselves easily to concrete popular exposition; they attract a particular class of minds, and where this is the case it is always probable that the consent of investigators is influenced to an unknown extent by "*idola*." Apart from these presumptions, it is true, as Mr. Fairbairn points out in an admirable passage, that the existing "nature-folk" are in no sense primitive; that they are as "old" as the most civilised community in the world; that they have very likely changed more, as they have shorter memories and are less capable of undergoing the growing influence of an abiding past; that they certainly differ radically from the ancestors of civilised nations in being unprogressive; and that this fundamental difference is probably connected with others. If we are to choose between two exclusive methods, we should decidedly prefer Mr. Fairbairn's; still we could wish that he had borne in mind the saying, "Howbeit, that is not first which is spiritual, but that which is natural." The author succeeds in showing that we cannot trace the religion of the Hindoos, or the Greeks, or the Hebrews to the fears of ignorant savages, or to their still more irrational confidence in charms and fetishes. With the higher races religion must be taken to have begun with a disinterested awe at the spectacle of the universe as a whole. But it is not equally clear whether this is a difference in degree or in kind: according to Comte, the indigenous religion of China, which Confucius only systematised, is to be reckoned as a form—though the highest form—of fetishism; the existing fetishism of Western Africa may very conceivably be related to primitive religion, as the cultus of our Lady of Lourdes and kindred devotions would be related, if they stood alone, to primitive Christianity. Every advanced religion gradually specialises itself into a multitude of minute beliefs and observances which look ridiculous to outsiders; a religion is degenerate when these absorb the whole of its vigour; a religion is in great peril when there is a constant struggle between those who maintain and those who deny the solidarity of the developments or accretions on the surface with the central thoughts and aspirations which both profess to venerate.

These reserves affect our estimate of Mr. Fairbairn's polemical success rather than the historical merit of his exposition of the primitive idea of God, and this must be rated decidedly high. Perhaps he lays a little too much stress on the paternity which may be traced by the help of etymology in the Indo-European conception of God. Was

the meaning of paternity approximately the same to the primitive Indo-European and to the late Mr. Maurice? But the genesis of the idea is rightly traced to

"two real or objective, two ideal or subjective, factors. The two real were the bright, brooding Heaven, and its action in relation to Earth. The two ideal were the conscience and the imagination. The real factors stimulated the action of the ideal. The ideal borrowed the form in which to express themselves from the real."

What follows is more doubtful:—"Conscience knew of relation, dependent and obligatory, to Some One. Imagination discovered the Some One on whom the individual and the whole alike depended in the Heaven." Conscience is one of the conceptions which Mr. Fairbairn takes for granted: he very judiciously observes that conscience and consciousness begin together; he might have added that both begin late—"I am" and "I ought" imply one another, for both depend on the analysis of "I."

Revelation is another conception which Mr. Fairbairn uses without analysis: if he had made up his mind upon a definition of revelation for purposes of scientific discussion, he might have reconsidered his polemic against the hypothesis of a primitive revelation which we suspect he really holds. We are in a position to discuss whether a particular thought is "given" either to the whole race or to its gifted leaders: and such a thought, if it be acceptable and have a transcendent subject, may fairly be called a "revelation," as distinguished from the results of "enquiry." No scientific enquiry into revelation can carry us beyond this, that a race or its teachers are in possession of a thought which is not their own: everything beyond belongs to faith and piety; science may ascertain that a human personality of such and such a teacher is rare or unique, but behind that personality science can never go.

Apart from this, it is to be regretted that the author has not dealt with the influence of superior men in originating and sustaining different religions, which is one of the most conspicuous *lacunae* in the new science (if we are to call it so) of comparative religion: and Mr. Fairbairn was especially called to do something to fill it, because sacerdotalism is a subject which has a strong, though painful, attraction for him. In discussing the religions of Christendom, we may speak of sacerdotalism without analysis, because the nature and grounds of the claims of the Christian clergy are approximately known by most, and the means of making such knowledge precise are generally accessible; but in India the case is different: we do not know familiarly what the precise claims of the Brahmanical body were, still less do we know upon what ground their claims were rested. Mr. Fairbairn observes very truly that there seems to be some relation between sacerdotalism and mysticism, which he is inclined to deduce from the inadequacy of sacerdotalism to satisfy religious aspirations for the highest light. Another explanation would be that, wherever the tendency to a mystical apprehension of things is strong, it embodies itself first in concrete observances which can be transmitted mechanically, and afterwards

concentrates itself in abstract individual fervour. To judge by the quotations which Mr. Fairbairn has collected, when the elder Vedic hymns were first chanted the simple solemnity of the sacrifice was enough for all; afterwards the time came when the few sought its worth in an esoteric theory of the rite, or in the strained austerity with which the performers prepared for it. Be this as it may, it is very little better than gratuitous to say that the Hindoo view that continued personal existence is an evil is the result of "sacerdotalism." It is pretty well ascertained that introspection and self-consciousness, if they go on long, turn for one reason or another to self-tormenting; for one reason or another most serious reflection in India ran to introspection and self-consciousness. That in all Hindoo systems the supreme good is conceived as deliverance from personality may mean little more than that felicity is impossible till thought ceases to be principally subjective, and becomes objective. The doctrine of the later Vedic literature, that in order to find deliverance it is necessary to get quit of merit as well as of demerit, ought to be compared with the doctrine of detachment which we find in the higher stages of all great religions, and more especially with the anxiety of one of old "not to be found having my own righteousness." It ought in no case to be made what Mr. Fairbairn makes it, a foundation for a theory that Buddhism is, and Brahmanism is not, an ethical religion: in both merit and demerit have temporal rewards and punishments in the life that is and in the lives to come; in both a mere good life is insufficient for final deliverance; in both a transcendent knowledge is necessary. The real superiority of Buddhism is that it makes knowledge work by charity, while Brahmanism makes it work by austerity; perhaps, too, it should be reckoned to the credit of Buddhism that it anticipates the doctrine "whosoever receiveth a righteous man in the name of a righteous man shall receive a righteous man's reward." It would be interesting to know how far the distinctively ethical character of Buddhism, so far as it exists, may represent a Turanian reaction against Aryan intellectualism. We are aware that Buddha's connexion with the non-Aryan races of the lower Ganges has been suggested already, and that the suggestion is discredited; but it can hardly be said to have been adequately discussed hitherto. If it should hereafter be satisfactorily supported, it would help to explain why the conflict between Buddhism and Brahmanism seems to have been decided by their influence over reigning dynasties; perhaps, too, why the Brahmanical reaction combated the nihilistic metaphysics of Buddhism by an appeal to the old monism which Buddhism in its early days still presupposed at whatever expense of consistency. The other side of the Brahmanical reaction, its promise of everlasting salvation on condition of simple faith in the legendary heroes whom it adored as incarnations of the Most High, is perhaps connected with the doctrine which we find in the *Bhagavadgita* and elsewhere, that we are to carry on our share of the business of the world, and not shrink and draw back out

of sensitiveness of conscience. Such a doctrine does not amount, as Mr. Fairbairn asserts, to an abolition of moral distinctions; but it does amount to an almost entire separation between the ideal and the practical, and such aspirations as might be left would find their highest available satisfaction in passive trustful contemplation of the glorified figures of the past. It is to be wished that the treatment of the belief in immortality in India had been completed by some reference to the form it assumed among the Siva worshippers, who, to judge by the notes to Sir Mutu Cumara Swamy's translation of a modern drama on Arichandra, had reached a very refined conception of felicity, in which the blessed are united to the true good, not absorbed in it. Perhaps the account of the earliest stage of the belief which we find in the cultus of the Pitris in the Vedas is a little too isolated and unsubstantial. The relevant texts, meagre enough to begin with, are treated too much as if they were what the Hindoos call them, a magical writing "seen" by holy Rishis, with no direct connexion with human life.

There is the same defect in the discussion of the much more copious materials for ascertaining the history of the Greek belief in immortality from Homer to Plato, with whom the writer stops short abruptly, though the way in which the question of immortality dwindled after him is full of instruction—of an unwelcome kind. The analysis of "Homer's" conception of *ψυχή* is very good and clear, but we want to be told how the after-life comes to be conceived so exclusively in terms of the physical horror of dying: was it want of clear and extensive geographical knowledge? One of the first suggestions of immortality is the thought of the lands of the setting sun to which it is believed the departing spirit goes, to pass, according to the Egyptians, with the sun into the other land of his rising. This did not prevent the Egyptians, at a later period, from conceiving the condition of the dead by the analogy of the actual condition of mummies. This may serve to explain why the dead of the golden age became aerial "daemons," while the dead of the silver age became blessed spirits in the under world. In the golden age the dead were probably left in some solitary place above-ground; in the silver age they were buried. It may be added that the view of "Hesiod" can hardly be represented as an advance upon "Homer's;" although "Hesiod" worked later, he often represents older traditions of a more settled population. We rather think that the gloom of the tragic view of death is exaggerated; the condition of the dead themselves was not distinctly conceived, and the cultus they received from the living, the influence they exercised over the living, were more prominent. The chapter on the Eleusinian mysteries is clear and forcible, though the traditional view that the Eleusinian mysteries were purely Greek, and the Orphic foreign and Oriental, requires, to say the least, to be thoroughly reviewed. My own belief is that the substratum of both is to be sought in the more or less passionate symbolical rites of the tribes of the central hills of Greece, and of the northern coast and isles of the Aegean.

The series of essays on the place of the Indo-European and Semitic races in history is unequal, and in its main outlines contains little that will be new to the readers of M. Renan and Prof. Max Müller. Some special points are well brought out—e.g., the materialist character of most psychological terms in Hebrew, and the unconscious tact with which the Christian thinkers of the third and fourth centuries attached themselves to the objective question "How ought God to be conceived?" instead of to the subjective question "What faculties has man for attaining a valid conception of God?" On the other hand, the classing of the Phœnician with the "Semites" is a sign that comparative ethnology in the author's hands has not yet worked itself clear of comparative philology: *au reste*, there is nothing to show that the religion of Phœnicia was more ethical than the religion of Greece, or the religion of Assyria than the religion of Rome (the entire omission of Rome very much impairs the value of the whole discussion). The religion of Greece, from first to last, sanctioned as much of morality as was matter of duty: morality covers the whole spheres of both duty and virtue, which are never quite concentric, though generally nearly co-extensive; in Greece the eccentricity was unusually great. Another misconception is to imagine that Homer and Indo-European religions in general place Fate above the Gods. Greek fatalism is generally nothing but rudimentary positivism, an obscure perception of the general force of things; it is the exception when, as in Aeschylus and Empedocles, this obscure perception becomes the object of imaginative awe.

The whole discussion would have gained immensely if the author's scheme had included China, the central flowery land of the Turanian peoples. The documents for the native Chinese religions will soon be completely accessible, and their importance is not by any means to be measured by their attractiveness. No theory of the natural history of religion which leaves out China can be much more than a dialectical exercise.

One inference which what is already known of China suggests is this, that there the process by which intelligent persons seem to themselves to discover that nothing is so certain as conduct, and that this is only certain to a particular kind of mind, was got over very early; and that, therefore, there has been full time to discover its pernicious effects, of which the least is the gross superstition of the great majority.

The discussion of the perpetuity of religion in the essay on theism and scientific speculation is one of the most brilliant and least satisfactory parts of the book; it is shown conclusively that the "argument from design" presents itself full-blown for the first time in Plato, and reappears with the early extensions of physical science after the Renaissance. We are asked to infer that if the doctrine of evolution discredits this argument it does not matter, because it belongs to philosophy, not to religion. It might be objected that when a philosophy which coincides with religion is discredited some indirect discredit falls upon religion. The writer succeeds better with his argument that in the Old Testament God often ap-

pears to be conceived as the immanent cause of the world, and that evolution or any other theory of origins makes a fatal breach (as Comte knew) in consistent positivism. In the essay on the development of the idea of God we notice an interesting suggestion that in the early history of Indian religion and elsewhere we seem to meet the paradoxical spectacle of spiritualism passing into naturalism. One explanation of this would be that men begin rightly or wrongly by imagining an ideal object for their subjective state or states as a whole, that afterwards they imagine an ideal object for their perceptions, and are apt to end by conceiving the objects of their perceptions in a purely matter-of-fact way, while they regard their moods as purely subjective, and neither imagine nor believe that they have any objective ground at all. G. A. SIMCOX.

EPOCHS OF HISTORY.

The Early Empire. By W. W. Capes, M.A. (London: Longmans & Co., 1876.)

In this little book Mr. Capes has given us a clear, concise, and lively sketch of the first century and a half of the history of the Roman empire. Few periods are less easy to epitomise satisfactorily. The wideness of the field, the absence of any prominent continuous line of progress, and the different aspects presented by the imperial system in Rome and in the provinces respectively, present serious obstacles in the way of abridgment; but, by dint of judicious arrangement and a complete mastery of his subject, Mr. Capes has to a great extent surmounted difficulties the gravity of which all students of the period will thoroughly appreciate. The book is practically divided into two parts. In the first the successive reigns of the emperors are succinctly described, while the second is devoted to a sketch of the imperial system, and of the general condition of the empire. The limits of his work prevent Mr. Capes from indulging in the luxury of references; but the quotations from classical writers are apt and numerous, and we hope that no readers will be allowed entirely to overlook the short list of original authorities appended to the list of contents.

In dealing with the personal history of the emperors themselves and the leading events of their reigns Mr. Capes is treading familiar ground. It was this department of imperial history which almost engrossed the attention of Roman historians, while the life of their subjects was left as a dark background against which the lurid splendours of the imperial city and her masters stood out in clear relief. But, though on this head Mr. Capes has merely to repeat what others have said before, he does so with freshness and good judgment. His account of Augustus in particular is especially forcible and just. With the modern apologists for Tiberius he is at variance, and decides that they adduce no evidence sufficiently strong to upset the verdict passed upon him by Tacitus. No doubt the "whitewashing" was carried to absurd lengths—notably, for instance, by Adolf Stahr in his *Tiberius*—but we cannot help thinking that Mr. Capes has hardly allowed sufficient weight to the

internal inconsistencies in Tacitus's account, and to the difficulty of believing, as Tacitus requires us to believe, that a successful general, a skilful administrator, and a man who till late in life retained his health unimpaired, and bore an honourable name, should, on the edge of the grave, have suddenly launched out into a career of monstrous profligacy. The story of the three last emperors of the old line, a story of brilliant promise, followed only too soon by insane outbursts of cruelty and debauchery, is vividly told. Equally successful are the rapid sketches of the two years' anarchy which followed the death of Nero, and of the restoration of something like peace and order by the Flavian dynasty.

With his twelfth chapter Mr. Capes turns from Rome, and from the biographies of her emperors, to the wider and more neglected field outside. Recent researches have considerably added to our knowledge both of the imperial system of government and of the state of things in the provinces; and on the latter of these two points, at any rate, Mr. Capes has bestowed great attention. The chapters on Roman citizenship, on life in the provinces and on the frontiers, and the army, are so good that it is impossible not to wish that they had been longer.

On the other hand, the imperial system of government hardly, we think, gets its due share of notice. In his account of Augustus Mr. Capes shortly describes the various powers which composed his prerogative, and the principal changes introduced into the Republican constitution. Again, in chapter xii. we have a brief sketch of the position finally achieved by the emperors at the close of this period.

It would surely have made things clearer, had Mr. Capes instead devoted a whole chapter to tracing the gradual consolidation of the imperial authority, and its gradual emancipation from those constitutional restrictions which formed part, in theory at any rate, of the Augustan system. As it is, there is an evident gap between the moderate sovereignty assigned to Augustus and the nearly absolute despotism described further on.

The book is supplied with good maps, and a useful index; but would be more complete still if a short chronological summary were added as well. H. F. PELHAM.

Chansons Populaires Bulgares. Par Auguste Dozon. (Paris: Maisonneuve, 1875.)

NEARLY two years have passed since we noticed M. Dozon's report on M. Vercovitch's "Songs of Mont Rhodope," and we have ever since awaited with breathless interest some further account of these poems. Macedonia, according to M. Vercovitch, is as much "a nest of singing birds" as Pembroke College was in Dr. Johnson's time. Every muleteer has his stock of traditional ballads about Alexander the Great, Vishnu, and other worthies, of whom the Macedonians cherish immemorial legends. M. Dozon, who reported on Vercovitch's discoveries, kept up a discreet reserve about his own opinion, and in his new volume, *Chansons Populaires Bulgares*, he scarcely hints at their existence. This is disappointing, and the ballads of

the Bulgarians scarcely console us, by their poetic beauty or scientific value, for the want of information about that sweet enthusiast, the patriotic Vercovitch.

M. Dozon very properly gives a brief sketch of Bulgarian history in his preface. According to him, this people has a disagreeable reputation, and the name of an obscure Tatar tribe which crossed the Danube in the sixth century has got an evil renown for "férocité et excès de tout genre." The Bulgarians of to-day are famous for keeping up the custom of dancing in great circles, which M. Dozon rightly recognises as the origin of all truly popular poetry. The ballads are composed by women, who, as M. Dozon says, and as magazine-editors ought to know, "care very little about the form of their verses." Hence rhymes are unknown to the Bulgarian muse, and hence too, perhaps, the commonness of common-places in Bulgarian Folksong.

Every one who has read much popular poetry knows pretty well what to expect. He knows that a few simple stories and plots will be presented in terms of strange singularity, that birds will talk, that gold and silver will be dragged in profusely, and that in the songs of primitive peoples the sun, the moon, serpents, and fairies will take active parts. The Samodivas, or fairies, are the most interesting characters in M. Dozon's collection of *pesmas*. They attend the birth of children, even of Jesus Christ:

"Trois femmes sont assises à la file,
Trois femmes, trois Samodivas;
L'une lui cousait une chemise,
La seconde lui tricotait un maillot,
La troisième lui ornait son bonnet."

They carry away girls and youths, they make love to mortals, and one is compelled to marry a man who steals her clothes while she is bathing, as in Mr. Morris's "East of the Sun and West of the Moon." Serpents, and the mythic Drakos of Romain legends, with his wife Elka la Dragonne, are the other supernatural characters of Bulgarian belief. All these beings are in alliance with the elements, or with elemental spirits, and the Samodivas raise whirlwinds, as the Scottish fairies were supposed to do. There are other dragons, Ogenik (*agni, ignis*), dragons of the fire. The mortals in the *pesmas* are brigands, unscrupulous monsters, one of whom treacherously murders a Turkish lady, while another sets his own wife on fire, after wrapping her up in pitch, because she has been forced into a second marriage after nine years' desertion.

A strange ballad about the marriage of the Sun shows that the savage "taboo," which prohibits speech between brides and grooms, daughters-in-law and parents-in-law, still lingers among the villagers of Bulgaria. The "taboo" is now a mere survival, and is evaded by a legal, or rather by a social, fiction. The ballads of love have little of the interest of the mythological songs. They are melancholy as a rule, and cruel Turks, or wicked step-mothers, have their own way with the affections of poor Rada or Todorka. The love of nature shows itself but rarely, in songs of farewell to woods, rocks, and streams. Besides the ballads, M. Dozon has given four or five versions from Servian, Romain, Bulgarian, and Albanian, of "Le

Voyage du Mort," the European tradition of the return of a dead lover or brother, to ride off with his bride or foster-sister. There was once a genuine English ballad on this theme, which we have never been fortunate enough to meet with. The Celtic version, not without suspicion of artistic improvement, is given by Villemarqué. The most notable point in M. Dozon's versions is the Bird song, "The Birds sing, the Birds say, who is the maiden that rides with the dead?" A similar chorus occurs in Callaway's *Zulu Märchen*, in *Rashen Coatie*, and in Campbell's *West Highland Tales*. M. Dozon has not noticed this coincidence, perhaps the strangest among the verbal coincidences that abound in the popular literature of various races. He has supplied the Bulgarian student with a careful glossary, and the lover of folk-lore with a brief but adequate index of Bulgarian beliefs. The most ghastly of these is the notion that the Plague built a church out of the bodies of the Dead. This fancy of the Spirit of Plague in female form occurs in Naake's Slavonic *Märchen*, and may be paralleled by the recent rumour of the apparition of the Goddess of Smallpox on the Hooghly.

A. LANG.

Mummies and Moslems. By Charles Dudley Warner. (London: Sampson Low & Co., 1876.)

It would be matter for regret if its incorrect and catchpenny title were to prevent anyone from buying and reading so excellent and readable a book as that which Mr. C. D. Warner has so unhappily named *Mummies and Moslems*. Contrary to the author's doubts as expressed in his preface, there is after all abundant room for much more to be written about Egypt. While the beautiful province of the Fyom has never been properly described at all; while the history of the ancient Christian Days and Churches of Egypt has yet to be written; while vast portions of the Delta are almost a *terra incognita* to European travellers, much relating to the Egypt of to-day is a sealed book to the majority of Englishmen. Mr. Lane's photographic delineation of the manners and customs of the Arab population of Cairo leaves, indeed, nothing to be desired; Lady Duff Gordon's humane and graphic letters show how intimately she had become acquainted with the character and daily life of the people of Upper Egypt; the extracts from the charming letters of Dean Stanley at the beginning of his *Sinai and Palestine* bring the features of Egyptian scenery most vividly before the mind, and Charles Kingsley's description of the Laura of the Thebaid is a miracle of accurate idealisation of a scene he never saw; but, apart from these and perhaps a very few others, the tendency of authors of Egyptian travel is almost invariably to degenerate into a kind of rhapsodical drivel, of which perhaps the most foolish and offensive specimen is the much-read work of Dr. Prime. It is, then, refreshing to meet with a work wholly free from faults of this kind. Mr. C. D. Warner does not present himself to his readers as an archaeologist, an Egyptologist, a naturalist, or a politician; but he yet contrives to give, and that in a straightfor-

ward and attractive manner, a great amount of useful information upon almost every subject about which an intending traveller to Egypt would wish to be informed. The author is a sharply-intelligent, good-humoured, kindly New Englander from the pleasant fields of Connecticut, and he tells what he sees as he passes up and down the Nile in a pleasant, unaffected manner. He is plainly a man of humane disposition, and a cultivated gentleman. That he is a man of shrewdness and keen observation is manifest upon almost every page, and when an inaccurate statement can be detected, which occurs but seldom, it is not that he has been deceived by his own eyes or judgment, but that he has relied upon information supplied to him by others. One pleasing trait in the author's character is his tolerance. Though he hails from Puritan New England, there are no whining ultra-Protestant denunciations in his book. He can see and approve of what is good in the Mohammedan religion—as, for instance, of the fact that their mosques stand ever open, not only for prayer, but as refuges for the poor, the friendless, and the weary, as well as for the pious and the repentant (p. 80); and he can even speak charitably of the much-abused Coptic Christians. "Nothing happens to us as to other people," he says (p. 133), "and we have had no opportunity to make the usual remarks upon the degraded appearance of these Coptic monks at El-Adra. So far as I saw they were very estimable people." And, again (p. 213), he says in words which writers on the Holy Sites of Palestine would do well to lay to heart, "I shouldn't lose my temper with a man who differed from me only a thousand years about the date of any event in Egypt."

Mr. Warner's plan is to take his readers with him to Alexandria and Cairo, and thence in his dahabeeah to the Second Cataract, relating what he sees by the way, and interspersing his narrative with scraps of information and amusing anecdotes. He is particularly happy in reproducing the talk of Pyramid Arabs, donkey-boys, and of his dragoman Abd-el-Atti. Unlike most writers, Mr. Warner gives an interesting account of Alexandria, a city which from its ancient greatness, its numerous relics of antiquity which are perpetually turning up, and its marvellously mixed population, deserves more notice than it has hitherto obtained. Street sights unnoticed elsewhere are described by a few happy touches:—

"Here comes a novel turn-out. It is a long truck-wagon, drawn by one bony horse. Upon it are a dozen women, squatting about the edges, facing each other, veiled in black, silent, jolting along like so many bags of meal. A black imp stands in front, driving. They carry baskets of food and flowers, and are going to the cemetery to spend the day" (p. 35).

The descriptions generally, whether of scenery, persons, or daily life, are unusually good:—

"The running Sais before a rapidly driven carriage is the prettiest sight in Cairo. He is usually a slender, handsome black fellow, probably a Nubian, brilliantly dressed, graceful in every motion, running with perfect ease, and able to keep up his pace for hours without apparent fatigue. In red tarboosk with long tassels, silk

and gold embroidered vest and jacket, coloured girdle with ends knotted and hanging at the side, short silk trousers and bare legs, and long staff, gold-tipped, in the hand, as graceful in running as Antinous, they are most elegant appendages to a fashionable turn-out" (p. 53).

How vivid is this picture; and yet, to judge from his statues, it may be questioned whether Antinous was not too "large, and languishing, and lazy," to have run very fast. In the Cairene donkey-boy's words on the next page one almost seems to hear the echo of the voice of David lifted up for his friend Jonathan. "Are you the brother of Hassan whom I had yesterday?" "No! He, Hassan, not my brother; he better, he friend. Breakfast, lunch, supper, all together, all same; all same money. We friends." Nothing ever really changes in the East. It is pleasant to mark that the author does justice to the much-maligned Arabs of the Pyramids. "The guides are perfectly civil; they do not threaten to throw me off, nor do they even mention backsheesh." The reason is plain: Mr. Warner is a gentleman, and treated his Arabs with politeness, and as a matter of course was well treated in return. For instances of graphic description the reader is referred to the account of the view from the top of the Great Pyramid (p. 92), to the admirable account of an Egyptian funeral (pp. 141 and 149), and to the sketch of sweet little Fatimé at Thebes (p. 197). Mr. Warner possesses a large share of dry, unstrained, quiet humour, which never degenerates, as in the case of his countryman Mark Twain, into either vulgarity or profanity. As funny as Thackeray's story of the Irish servant-girl who brought up the coals on a china plate is the author's description of the two boys at Farshoot who scoured brass dishes by first putting sand in them, and then, standing in them, whirled half round and back, while they supported themselves by clinging to the side of a house.

While, as a whole, Mr. Warner's book strikes us as marvellously correct, still, as may be expected in a volume of nearly 500 pages, mistakes occasionally occur. A few of these it may be well to mention. Thus the writer never seems to realise that the Khedive is not an independent sovereign, for he always speaks of his mother as the "Queen-mother." It is, moreover, a mistake to suppose that the Coptic Christians practise circumcision as a religious ceremony. It is not this, but merely an immemorial custom, wisely retained from considerations of health and cleanliness in a hot climate (p. 132). Mr. Warner, again, is mistaken in speaking of Dayr el-Adra as "a mud settlement of lay brothers and sisters." The settlement is simply a Christian village. Nor is it correct to say that the shooting of the people's pigeons is "permitted away from the houses." It is "permitted" only because the down-trodden fellah dares not resist, and knows that he has no redress for anything he may suffer at the hands of the *horadji*; and the wholesale slaughter of the poor people's birds by English and other travellers is a piece of oppression which cannot be too strongly condemned. Mr. Warner is quite wrong in supposing that "in the whole land of Egypt above Cairo

there is no such thing as an inn." There is a large hotel at the mineral springs of Helwân in the desert opposite Mitrahenny, and a *locanda* at Asyout. In addition to these, lodgings can be obtained at Thebes, and "a clean Christian who wishes to keep clean" can effect that laudable purpose in many Sheyks' houses in the upper country, and even in some of the mud dwellings of the fellaheen, which are far from being so dirty as they look.

Likemost Americans—for whom, strangely enough, a despot seems to have a wonderful attraction—and as he himself testifies, Mr. Warner seems to have taken a somewhat favourable view of the character of the present Viceroy. The short time he was in the country, and his familiar intercourse with the United States generals in the Khedive's service, may have tended to this; but a far juster view of the matter is that of the "very intelligent" English gentleman at Cairo quoted at p. 432. Mr. Warner does not seem either to abhor slavery or to be aware that, apart from his cruelties to the "free" fellaheen under the infamous forced-labour system, the Khedive is the greatest slave-buyer and slave-holder in Egypt, and that all his innumerable palaces are full of slaves to overflowing. Nor does he seem to appreciate the extreme misery of the fellah class and poor generally, or the cruel and shameful exactions to which they are subjected by their Turkish ruler.

In spite of these blemishes, we repeat that Mr. Warner's book is a good and an interesting record of Nile travel, and we part from him with regret, and with a hope that he may some day return to Egypt, and, visiting the Delta, the beautiful Fyoun, and the Oases, give his former readers and friends an account of his experiences in those comparatively little-known regions.

GREVILLE J. CHESTER.

NEW NOVELS.

Hogan, M.P. (London: Henry S. King & Co., 1876.)

Sir Hubert's Marriage. By Gertrude Townshend Mayer. (London: R. Bentley & Son, 1876.)

Gervase Sacheverill. By Theodore Howard Galton. (London: Burns & Oates, 1876.)

Grassmere Farn. By "Frank." (Liverpool: R. A. Elliott, 1876.)

"HOGAN, M.P.," despite its title, has not much in common with that dreariest birth of time, the political novel. It is true that the plot in some measure turns on the not very novel incident of a young barrister with some brains and no money being selected and "run" for a constituency by certain persons who have private ends to gain, and left stranded by an inopportune dissolution. But politics proper occupy a very small place in the book, which is really an elaborate study, apparently from the life, of various phases of Irish (chiefly Dublin) society. The author, whoever he is, shows very considerable power of sketching class-character, though he is perhaps less happy with individual figures. But we must say that the classes represented have very little

cause to thank him, whether his portraiture be faithful or unfaithful. The coarse magnificence and naïve vulgarity of his Roman Catholic "whiskey people" are only more offensive than the petty spite, the half sham dignity, and the shifty shabbiness of the better-bred Protestants; while the picture which the writer has drawn of Trinity undergraduates can only fill the soul of an English university man with amazement. As to the sketch of Irish country life which the second volume contains, one is, as the author represents his hero, "astonished beyond measure at the Irishness of everything." The sluttish plenty, the squalid want, the general dilapidation, the agent, the priest, the everything and everybody which we had fancied to be "properties" as much antiquated as the white coat and bull-dog of our own countrymen, all reappear, and are solemnly pressed on us as facts. It is, of course, impossible for a stranger to judge of the accuracy of such descriptions; but there is an air of veracity about the book and of impartiality in the writer's all-round hitting which somehow or other impresses one favourably. As a mere novel, *Hogan, M.P.*, will hardly rank high: the incidents are somewhat stale, and the plot is too obvious, while, as we have already hinted, the characters are not individually good. The hero is very indistinctly presented; Nellie Davoren, the heroine, in the last volume is an entirely different personage from Nellie Davoren in the first; and it is entirely incomprehensible why the financier Saltasche (one of the best figures in the book) should have preferred exposing himself to disgrace and ruin by levanting with other people's money when he appears to have had plenty of his own. The account of the *Beacon* newspaper in the third volume is a very clever and sufficiently obvious, not to say well-merited, satire. But the value of the book consists in the contribution which it makes (if, indeed, it does make it) to the literature of the strangest of all national characters.

The principal strength of *Sir Hubert's Marriage* lies in its dialogue, which is singularly good. With the exception of one rather dubious scene, which affects to represent the conversation of London society, the whole book is remarkable for the natural and truthful colouring of the talk, which is tolerably abundant. The characters, too, are nearly as good as their words, though we cannot help demurring a little to the very un-modern devotion of the heroine, Diana Redfern, who not merely bears patiently the indifference of the man she loves, but actually busies herself in educating and cultivating the village maiden he thinks he has chosen. It need not be said that all comes right; indeed, the author is so anxious to mate all her rather numerous characters properly that she cruelly sacrifices an unlucky odd man who can find no partner by despatching him to the Herzegovina. There is nothing particularly original about the conception or execution of the book, but it is an excellent and workman-like example of a commendable class of fiction.

We own to having been bitterly disappointed by Mr. T. H. Galton's book. The

author in an enthusiastic preface addressed to Dr. Newman speaks of re-awakened interest in "those old confessors and martyrs who weathered the storm of nearly three centuries of unrelenting persecution." Now, it is only surprising that interest should have wanted reawakening in these tough tercentenaries who thus triumphantly confuted at once Mr. Thoms and the Protestant religion. Hoping to be introduced to at least one such conqueror of Old Parr and Mr. Jenkins combined, we turned the pages of *Gervase Sacheverill* eagerly, and we must say we thought it unkind of Mr. Galton to put us off with a trumpety martyr of sixty-five. On reading further, however, we saw reason to acquit him of unsound opinions on human longevity, and to substitute the milder charge of a slight confusion in thought and language. We could wish that he would try his own interesting experiment of reading *Campion's Ten Reasons* "over a rushlight." A decidedly insufficient supply of light and an imminent peril of combustion to the valuable work in question would probably follow. Also, we should like to meet a gentleman who was "strongly leavened with the views of Hobbes and Milton," if only for the purpose of ascertaining what those views are. But we have no wish to be too hard on Mr. Galton. He is evidently possessed of an amiable and genuine enthusiasm for his religious views, and of considerable local knowledge of Worcestershire; so that if these two good gifts sufficed for the writing of a good novel he would doubtless have written one. We will give him one piece of friendly advice. Let him not another time, when he wishes to support an historical or social statement, rely on the Bardolphian security of Lord Macaulay. The critical reader will not thank him for his reference, and the uncritical does not want it.

We shall probably be able to convey a good idea of *Grasmere Farm* by a few simple statements. There is in it a couple who, at a moment's notice, at sunset, and without the trifling formality of a licence, get married by a casual parson at their uncle's bedside as coolly as if no Lord Chancellor Hardwicke had ever arisen to thwart true lovers and spoil legitimate comedy. There is a gentleman who writes immortal works under the signature "Excelsior." There is an author who, we suppose deliberately, writes the following sentence (the scene is Pau):—"They walked up the street towards the church, as Madame called it, but it was really a Catholic chapel"! The italics and the note of exclamation are ours.

GEORGE SAINTSBURY.

CURRENT LITERATURE.

Epochs of English History. England a Continental Power, 1066-1216. By Louise Creighton. (Longmans.) The least satisfactory part of this little volume is its title. It is only by straining the natural meaning of the words that England can be said to have been a Continental Power even under the Angevin Henry; and the term as used by Mrs. Creighton is the less suitable as the relations of the insular kingdom to the mainland receive from her only the slightest possible notice. The book itself, however, is a very good epitome of English History

from the Conquest to the Great Charter. It is simply and intelligibly written, without being overloaded with details; and the constitutional changes, and leading features of the period generally, are brought within the comprehension of the youngest scholar. Here and there is a passage which might be amended, as tending to convey a wrong impression. Thus, the Conqueror's reason for not daring on his deathbed distinctly to bequeath the English crown to his son William was not that "the English people had the right of choosing their own king." Confessing that he had won the kingdom by violence, he left the disposal of it, not to the people, but to God himself ("nulli audeo tradere, nisi Deo soli," according to Orderic), to whose minister, Lanfranc, was expressly reserved the decision as to the crowning of his successor. In the reign of Stephen, Earl Robert of Gloucester deserves mention, if only that the party of Matilda may be acquitted of the seeming folly of releasing such a prize as the captive king merely "in return for other prisoners." Altogether the volume is admirably adapted to its purpose as an elementary school-history for beginners.

HERR KOLDE has attempted in his little work *Luthers Stellung zu Concil und Kirche bis zum Wormser Reichstag* (Güterloh: Bertelsmann) to show how gradually Luther tore himself away from the old traditions on the authority of the Councils and the Church. If it cannot be said that the author has seized upon any new points of view, he has produced a work which may serve to complete Kortlin's book, which is the latest biography on a large scale. He has, however, allowed himself to be enticed by hypotheses which deserve no place in a historical work when they are unsupported by any basis in ascertained facts. He gives us, for instance, a purely imaginative picture of that which would have happened if Luther when at Worms, in 1521, had been less firm in his rejection of the Council. We do not feel inclined to join the author in regretting that Luther was not more compliant.

HANS SALAT is chiefly known by the chronicle in which he describes, with the thorough hatred of a fanatical Catholic, the unhappy quarrel which ended in the battle of Kappel and the triumph of the Catholic cause in Switzerland. But his other writings, and especially his poetic effusions, have an interest of their own; and we may therefore thank Herr Bächtold for collecting for the first time, under the title of *Hans Salat, ein Schweizerische Chronist und Dichter aus der ersten Hälfte des XVI. Jahrhunderts, sein Leben und seine Schriften* (Basel: Bahnmeier's Verlag), these scattered productions, some of which he must have had some difficulty in acquiring. He has added a biography of the writer. Fortunately he met with Salat's diary in the Bibliothèque Nationale at Paris. He has printed this diary and some letters, which do not redound to the credit of the author, whose character does not appear to have been equal to his talents. Herr Bächtold promises us, at no distant time, a History of German Literature in Switzerland. The evidence which he has already given of his literary powers promises well for this new undertaking.

Joannis Coleti Opuscula quaedam theologica. Letters to Radulphus on the Mosaic Account of the Creation, together with other Treatises. By John Colet, M.A., afterwards Dean of St. Paul's. Now first published with a Translation, Introduction, and Notes, by J. H. Lupton, M.A., Sur-master of St. Paul's School, &c. (Bell and Sons.) The principal treatise in this volume has already been made known to the public by Mr. Seebohm, who gave an analysis of its contents some years ago in the second edition of his *Oxford Reformers*. But those who have been led by Mr. Seebohm's book to take an interest in Colet's writings will welcome all the more readily the publication of the exact text of those writings carefully edited and translated by the sur-master

of St. Paul's School. As specimens of Biblical criticism 300 years ago they would be interesting quite apart from the fact that Colet was the author, for they treat of subjects which have excited no little attention of late years, and treat of them, as the editor remarks, in a very modern spirit. Nevertheless, we cannot quite agree in the opinion quoted by Mr. Lupton from Mr. Green's *Short History* that Colet was the beginner of Rational Christianity in England. For, not to mention that the writings of Bishop Pecock, among others, prove the contrary, we think there is a considerable presumption the other way from these writings themselves. The Mosaic cosmogony was not less opposed to the scientific (or unscientific) views which prevailed in Colet's time than to those of our own day; and Colet goes about to harmonise it, so far as he could, with common sense and generally received opinion. Dismissing at once the literal sense as utterly untenable, he endeavours to explain the whole narrative as a poem, in which the author, Moses, adapted his language to the comprehension of an ill-instructed people. The days of creation were not really days, or even ages, as some now are inclined to consider them, but only a certain order in the works. They are not an order even in time. The first day was the original eternity, in which all things were created at once. The other five days' work was really included in it, and what follows is a mere expansion. So far Colet, though expressing a view, it may be, peculiar to himself, does not seem to tremble for its reception; nor indeed do we find, as a matter of fact, that he scared the orthodox world in his day as Colenso did in ours. He is evidently far more apprehensive about the further stages of his explanation, which he calls new wine to be poured into old bottles; and to say the truth we greatly doubt whether there are vessels even at the present day capable of retaining his vintage. But his doubts do not seem to have any relation to the fear of being thought a heretic. They arise simply from his own great diffidence as to an explanation which he puts forward simply as conjectural, and which must be acknowledged to be very mystical; inasmuch that he at length honestly confesses that he is very likely in the dark himself, as nothing appears to him more like night than a Mosaic day! These remarks on the cosmogony of Genesis are contained in a series of letters to a friend named Radulphus. The volume contains also a fragment of an exposition of St. Paul's Epistle to the Romans.

In the preface to Rudolf Usinger's *Die Anfänge der deutschen Geschichte* (Gotha: Perthes), Waitz explains the plan of his departed friend's work. It was originally intended to have been a History of the Saxons, in the old sense of the term, but gradually expanded into an account of all the German tribes. Waitz regrets that the author did not adhere to his earlier idea, and shows how the collective names "Saxon," "Frank," &c., gradually took the place of the separate tribal names. The main work is so incomplete that it can only possess a relative value. One point may be noticed. Usinger thinks that the Celts (Belgae) once possessed much of the German sea-coast; and that when driven westwards by the German tribes, part of them passed into Gaul, but the greater part into Britain—the name *Cymry* being identical with *Cymri*. Then the German tribes occupying the old Cimbric land were naturally called by the old name (a similar transference is claimed for the term "German" itself), and the Germans, Cimbri, and Teutones, first crossing the Rhine at its mouth, then recrossed it higher up, and so reached the Danube. The whole discussion, of course, can only rest on possibilities. Mommsen takes an opposite view as to the movements of the Cimbri.

Sebastian Bürster's Beschreibung des Schwedischen Krieges, 1630-1647. Hrg. von Dr. Friedrich von Weech. (Leipzig: Hirzel). This little book, dedicated to the poet G. Freytag, opens up a new and interesting source of information regarding

the history of the later stages of the Thirty Years' War. It is true the chronicle of Sebastian Bursler, a monk of the convent of Salem in the Grand Duchy of Baden, was not entirely unknown hitherto. It is mentioned in a paper of A. Stern's in the twenty-second number of a historical magazine, *Die Geschichte des Ober-Rheins*. But this is its first appearance in print, together with an introduction and the most necessary notes. Dr. F. von Weech has done a useful work in introducing to a wider circle the ingenuous and superstitious, but at the same time humorous and circumspect monk, who kept his journal carefully from year to year. On the whole, social history gains most by the publication. The spoliation and oppressions to which the convent was subjected alike by friend and foe, the wretched plight of the country-people round about, the demoralisation prevailing even in those parts, are graphically described by the chronicler, who gives besides a circumstantial account of the more important political events, so far at least as they fell under his notice. As regards the fortunes of the country round the Lake of Constance in those times of disturbance, the sieges of Constance and Ueberlingen, the deeds of Gustavus Horn, Bernhard von Weimar, of Konrad Widerhold, and Franz von Mercy, the book is a mine of valuable information, not to be overlooked by the student of the history of the Thirty Years' War.

The Impeachment of Mary Stuart, sometime Queen of Scots, and other Papers, Historical and Biographical. By John Skelton, advocate. (W. Blackwood & Sons.) It is now more than forty years since Mr. Carlyle, indignant at the scanty space afforded by historians to the illustration of the change brought about in Scottish life and institutions by the Reformation, estimated the number of volumes written on the eternal "Beauty and Booby" story at two good horse-loads. More recent writers have shown no less activity in the production of works on the like subject, to the equal neglect of more edifying matter in the realm of philosophy taught by experience. Stale and wearisome as is become the controversy regarding the guilt or innocence of Mary Stuart, we cannot withhold a few words of commendation from the present volume; its brevity alone deserves so much. "The curtest defence of the queen hitherto," writes Mr. Skelton, "has seldom been compressed into less than three or four volumes octavo." Here, however, the reader will find all that is worth remembering of the matter confined within the limits of about 130 pages. Upon the appearance of Mr. Froude's volume on the Darnley murder and the Bothwell marriage, Mr. Skelton (who, we believe, is better known as "Shirley" to the readers of magazines) "told the author that he had failed to satisfy him that Mary had aided and abetted in the crime in the manner the Casket Letters seemed to represent. Mr. Froude, in reply, proposed to insert in *Fraser* any observations on the subject that Mr. Skelton might choose to send him; and in due course of time "Shirley's" vindication appeared in the columns of that magazine. This vindication, with extensive alterations and additions—much, indeed, entirely re-written—is now republished. The counsel for the defence, for so the writer describes himself, says he is a plain speaker, unused to the arts of the rhetorician; but the simple story he has to tell needs no embellishment. This assumption of the character of the plain blunt man, who loves his client, seems to us, however, a little overdone, for we get but a very little way in the argument without meeting with Darnley in the shape of "a noxious, unclean, hateful animal—hateful to God and man," while Mary encounters us as a "girl who by nature was inclined to trifle, to float with the stream, to put as far as possible from her what was grim and ugly and tragic in life;" but, once roused, "was transformed into such a beautiful destroying angel—haughty, defiant, inflexible—as

poetry has created." Elsewhere we read that "there was, after all, if not a deep vein of sadness, at least a poetic pensiveness—the pensiveness of a doomed race—in her nature;" and similar flowery fantasticalities are scattered with no sparing pen. We have, nevertheless, read the essay with much interest, and advise a careful perusal of it to all whose knowledge of the facts and arguments bearing upon the mystery is limited. With this advice we would venture to couple a recommendation that the subject be carefully avoided ever afterwards. Life is short, and there are very many other things better worth study in our world's history. The other essays in this volume, on Dryden, Bolingbroke, &c., form pleasant reading enough, but call for no special remark. A highly ideal design for a portrait of Mary, by Sir J. Noel Paton, adds much to the value of the work.

König Sigmund und die Reichskriege gegen die Hussiten. Von Dr. Friedrich von Bezold. Zweite Abtheilung. Die Jahre 1423–28. (München: Ackermann.) The first part of this work appeared in 1872. Since then Herr von Bezold has treated the same subject from a general point of view in his *Kulturhistorische Studien zur Geschichte des Hussenthums* (ACADEMY, May 8, 1875). The book before us has all the merits of the young author's earlier studies—honest research, clearness of expression, and full acquaintance with the literature of its subject. He makes excellent use of the documents, chronicles, popular songs, and printed matter already known, and has besides collected a vast quantity of new and valuable material from the archives of Nuremberg, Munich, and Nördlingen. His narrative often falls into the track of Droysen and other recent authors, but succeeds in introducing important corrections and additions. The book contains more than is expressed in the title. Although the Hussite war was undoubtedly the great event of the time (1423–28), the cause of universal Christendom was the cloak for many other ends, and the author accordingly gives us an account of the policy of King Sigismund and of the German princes in opposition, as well as of the interests of the Church and those of the Slavonic race, while the Hussite war, the great object, is seemingly often entirely lost sight of. The growing importance of the question of constitutional reform in Germany at that time obliges the author to pay quite as much attention to Germany as to Bohemia, and to recount not merely the forays and bloody battles which took place, but also the political negotiations and wordy congresses. Important as these endeavours to provide the German Empire with a military organisation and a regular system of finance were in themselves, they are still more so as showing the wretched state in which the Empire then was. The King, almost habitually absent, took no part in the measures of reform; he was absorbed in the visionary idea of securing peace to the whole of Christendom, and, without any real power of his own, was engaged against the Turks in the East. He was full of fear of the Houses of the Hohenzollern and the Jagellons; and, having begun his reign with high-sounding phrases about the honour of the Empire, had surrendered Schleswig to the Danes, and was trying to make the best bargain he could for Jülich and Gelders. We see the Electors and princes divided by mutual jealousies, and while endeavouring to restore peace to the realm, themselves taking frequent part in the feuds which disturbed it. The towns shrink from every new tax, and pursue a petty and mean policy of their own. Nevertheless, at those endless conferences questions of the highest importance were raised, and even the defective conclusions come to paved the way for more important reforms. In the first place, the *Agreement of Bingen* must be regarded as a very significant step towards the reform of the Imperial constitution. It was then that the Electors, with the Elector of Brandenburg at their head, openly declared that the highest

business of the State no longer belonged to a powerless crown, but to a joint body of the highest princes of the land. Impelled by this thought they formed a confederation resembling that league which some twenty years earlier had deposed Wenceslas—which league furnished a precedent also for the Pope's acting in concert with the Electors against a King who showed so little zeal in putting down the heretics. Herr von Bezold has had the good fortune to discover some documents that shed a new light on the steps subsequently taken by the Bingen Confederates, and on their negotiations with Sigismund. It is clear that with the help of the towns and the party of the knights, the King thought of taking up arms against the powerful princes. But the towns, on whom he chiefly depended, ready as they were to promise him moderate assistance against the Hussites, would not ally themselves with him against the Electors. The Electors on their side were not in a position to humble the King in the way they had intended to do, chiefly because the only thing they cared about was the increase of their lands and revenues, and therefore they sacrificed every higher object to their own selfish plans. Under these circumstances there was no hope of extinguishing the fire that had blazed out in Bohemia. Nothing but the civil war between the two parties of the Hussites, the Utraquists and Taborites—the death of Ziska, the purest character and greatest military leader the Bohemian rising had produced, and the continual fights about Moravia, could have prevented the Bohemians from entering on a war of aggression on a grand scale. The aspect of things changed some time after the terrible battle of Aussig in 1426, and the revolution which took place in Prague, April, 1427. As soon as the treachery of Prince Korybut had been discovered, he himself thrown into prison and his party broken up, the Bohemian capital fell into the hands of the Radicals, and they began those terrible wars of aggression against the Empire by which passion and violence were again awakened. Herr von Bezold shows very clearly that the Frankish knights were the first cause of a powerful war being set on foot, and the miserable end of the new campaign; he goes on to show how in consequence of this a most remarkable attempt at a better organisation was made at Frankfurt, and also the wretched result of this same attempt, the chief importance of which lay in the levying of a general Imperial war-tax. The picture he gives is not a pleasing one, but it is clearly drawn, and free from all personal bias.

The Law of Nations considered as Independent Political Communities: or, the Rights and Duties of Nations in Time of War. By Sir Travers Twiss, D.C.L., &c. Second Edition Revised, with an Introductory Juridical Review of the Results of Recent Wars, and an Appendix of Treaties and other Documents. (Longmans.) This is a reprint, which, however, we are glad to find was necessary; nor does the introduction mentioned in the title-page attempt to criticise very deeply the events of the twelve stirring years since the appearance of the first edition. Sir Travers points out some delicate irony at the inconsistent tendencies observable in the most popular modern theorists on international law. In order to obtain an increased protection for private property, war is made to be a relation between Governments and not between nations, by those who are foremost in advocating the armed-nation system of compulsory military service; and "the three rules" of the Treaty of Washington are supported on the ground of a distinction between ships and other chattels, by those who object to the capture of private enemy's property at sea on the ground of the absence of such a distinction. The truth is that international law is in a state of development; but we take it that its amicable development will not be facilitated by giving the name of a principle to every generalisation at which each writer may desire to arrive.

The Law relating to Public Health and Local Government. By Gerald A. R. Fitzgerald, M.A., of Lincoln's Inn, Barrister-at-Law, and late Fellow of St. John's College, Oxford. (Stevens and Sons.) In this volume Mr. G. A. R. Fitzgerald, the draftsman employed by the Government in the preparation of the Public Health Act, 1875, reprints that statute with an "introduction, notes, and appendices." The introduction is a readable and, to the legislator, a useful *résumé* of a very intricate and far from creditable chapter in the history of our legislation. The great Consolidation Act of last year contains practically the whole statute law upon its subject, and, as Mr. Fitzgerald's notes, being corrected up to the latest judicial decisions, contain therefore the whole of the judge-made law on the subject, his book may fairly claim to rank as a *corpus juris* in sanitary matters. It is carefully done, and cannot fail to be of much service to the lawyer, the medical officer, and the "local authority."

The City Life; its Trade and Finance. By William Purdy. (Sampson Low and Co.) The author of this book has collected in it a considerable amount of useful statistical information which gives it some value, but his own discussion of the subjects to which his statistics relate tends to the confusion rather than the diffusion of useful knowledge. The chief lessons which he seems struggling to teach are that the commercial morality of the age is low, and that the gambling and dishonesty of merchants, not the indiscretion and improvidence of bankers, have been the main causes of recent losses in trade; but that some improvements may be made in the management of deposits and the practice of banking. His facts and suggestions are, however, so mixed up with tedious platitudes, rambling and incoherent reflections, criticisms of writers who are not indicated, and whose views are alluded to rather than stated, that few readers could have time or patience to sift the wheat from the chaff. Among facts which he adduces justly enough as characteristic of the age is that five columns of a journal which makes high pretension to Evangelical religion are regularly devoted to accounts of horse-races, sports, boating, and football. But what can he mean by speaking (p. 44) of "the Cobden theory" that capital should be placed within the reach of the artisan for various experiments? Mr. Cobden's theory is summed up in the freedom of trade. And why, on the other hand, does he frequently surround common words with inverted commas, as if they were recondite quotations?

NOTES AND NEWS.

M. CERNUSCHI, the zealous and able champion of bi-metallic money, is now in London, where he is known to many distinguished persons.

AMONG MESSRS. Trübner's announcements we notice:—On "Reliable," with a General Survey of English Adjectives in -able, by Fitzedward Hall; *A Grammar of the Eastern Hindi, or the Vernacular of Eastern Hindustan and Western Bengal, commonly called "Ganviri,"* by the Rev. A. F. R. Hoernle, Professor of Sanskrit at Jaynarain College, Benares; *A Grammar of the Hindi Language,* by the Rev. S. H. Kellogg; and *Michael Servetus: his Life and Works,* by R. Willis, M.D.

WE understand that Messrs. Macmillan and Co. will publish in the autumn for the Rev. Dr. Farrar, Canon of Westminster, a volume of sermons on topics connected with school life, preached during his headmastership of Marlborough College.

THE review of Tieknor's "Memoirs" occupying forty pages of the last issue of the *Quarterly Review* will call general attention to that work, and we are glad to note that a complete English edition is in the press and will shortly be published by Messrs. Sampson Low and Co.

SOME months ago the Japanese Government presented to the India Office a copy of the Buddhist *Tripitaka*, "printed in Chinese, with Japanese notes in the Katagana characters." This copy is that commonly known in China as the Northern Collection, from its having been made by order of the Emperor Wan-leih, of the Ming Dynasty, after the Court had moved from Nanking (the southern capital) to Peking (the northern capital). It was reproduced in Japan in the year 1679, and was republished with an Imperial Preface about the year 1682. The entire set of books consists of rather more than 2,000 Japanese volumes, and so lightly did the Council for India estimate the difficulty of cataloguing such a collection, that on December 14, 1875, they passed an order "That Mr. Beal be requested to prepare a compendious Report of the Buddhist *Tripitaka*—to be ready in six months." The time thus meted out was clearly insufficient for the thorough performance of the work; but Mr. Beal set about his task with energy, and the result has been that he was able to submit a printed catalogue and brief report of the books on June 19, thus keeping to within a day or two of the limits imposed by the Council for India. Of course the work has suffered, as he says himself, by his having been thus pressed for time, and, indeed, it is a matter of surprise that he should have accomplished as much as he has. In each case he gives a transliteration of the Chinese titles of the works, and in instances where these are simply translations from the Sanskrit he gives the original titles, together with the names of the translators when they are obtainable. In the case of works written by Chinese authors he translates the titles, thus affording an insight into the nature of their contents. At the end of the catalogue he adds the "compendious report" which he was directed to make, and in which he gives a very interesting *résumé* of the different classes of works into which the collection is divided. It is well known that Mr. Beal has devoted himself for years to the study of Chinese Buddhism, and the catalogue before us is just such a one as we might have expected from the pen of so able and painstaking a scholar.

MR. ARTHUR ARNOLD will contribute an article on "Russia in Europe" to *Fraser's Magazine*.

THE Rev. W. D. Macray writes:—

"Mr. Hosack, in his article in your number for July 1 on Mary, Queen of Scots, refers to a manuscript English narrative of her trial, which, he says, 'is, or recently was, in the Bodleian.' As it is possible that these words may be misunderstood, permit me to add that the interesting narrative in question is contained in a volume which I had the pleasure of showing to Mr. Hosack some time since in the reading-room of the Bodleian Library, but which belongs to Dr. A. Batt. of Witney, and had then been lent to me by that gentleman for examination."

THE *Revue Historique* for July contains the beginning of a memoir of François Hotman, the celebrated juriconsult of the 16th century, by M. Dareste. Several unpublished letters of Hotman are given, which illustrate the politics of Europe during the religious wars, and throw light on the state of society and learning. M. Gaffarel begins a paper on the "War of the Fronde in Provence." M. G. Monod has edited some fragments of Michelet on the Roman emperors. They are merely notes taken at a course of his lectures, which were meant as an introduction to Mediaeval history, and were delivered at the Ecole Normale in 1827-1838. Though slight, they contain much of the force and insight which marks all Michelet's writings.

MESSRS. HACHETTE and Co. announce an important work on Political Geography by M. Himley, one of the professors at the University of Paris. It is called *Histoire de la formation territoriale des Etats de l'Europe Centrale*. As Mr. Freeman has a book on Political Geography in the press, it will be instructive to compare the conclusions which the two writers arrive at.

THE historical section of the *Bibliothek für Wissenschaft und Literatur* (Berlin) gives as the second volume of its series "A Handbook of the History of Austria, from the most ancient to the most recent times," by Franz Krones. A compendious and readable history of Austria has long been a desideratum, and as the author, who is Professor of National History at the University of Graz, has been long known as a diligent and trustworthy historian, as well as an able writer, a better choice could scarcely have been made by the promoters of the *Bibliothek*, both as to the subject-matter and the authorship of this continuation of their historical series.

AN interesting work has appeared in Germany on the *Ancient Sources of Florentine History*, by Otto Hartwig, in which he treats especially of the value and authenticity of the *Gesta Florentinorum*, belonging to the century between 1125 and 1231, and enters fully into the question of the verifiability of the traditions, which ascribe the rebuilding of the city in about 800 to Charlemagne, as set forth in the *Chronica de Origine Civitatis*.

Two brochures on the woman question perhaps deserve a few lines. A woman who gives her "thoughts on woman's rights" to the world through Messrs. Blackwood writes like a lady, and sees clearly that if women abandon their traditional self-suppression they would lose the kind of consideration which many, perhaps most, of them receive. She does not face the contradiction there seems to be between self-support and self-suppression, and is unreasonably surprised that a clergyman finds it easier to get a nursery-governess than a schoolmistress—even a nursery-governess is conventionally a lady. "Emme Dee," who writes to order (of M.D.), and publishes with Haughton and Co., holds that women ought to be taught physical science and housewifery, and give up expensive tastes, and then most of them would be able to marry. "Emme Dee" writes shrewdly, abruptly, and incoherently. Both writers fail to see that acquired needs and incapacities make up nine-tenths of civilisation.

ON July 9 there died at Stockholm Charlotte Bremer, the only sister of the celebrated Miss Fredrika Bremer, in whose literary labours she to a considerable degree participated. The deceased lady was born in 1799.

THE July number of the *International Review* contains a reply by Prof. Curtius to Mr. J. Hadley's criticism of his well-known doctrine as to the original seats of the Ionians.

WE have already made mention of Dr. Kuenen's article, which occupies the place of honour in the *Theological Review*. A notice of the recently published *Life of Schopenhauer* tries to establish a connexion between the anything but amiable character of that philosopher and his philosophy. The biographer, it seems, compares him in his "boisterous arrogance" with Wordsworth; but surely, though Wordsworth was arrogant, he was very far from "boisterous." He certainly never threw his landlady down stairs, nor told his mother that her writings would not live even in the lumber-room. The article on "Free Will and Responsibility" is a strange mixture of grotesqueness and acumen. Does not the author need a clearer distinction between direct and reflex acts of the mind? Free Will is that reflex act by virtue of which human agents are responsible or liable to praise and blame, punishment and reward. We should join in deprecating the crude analysis which would set down such an act as "swayed blindly and by accident," and entirely devoid of laws of its own. We observe in the notice of Ziegler's *Itala-fragmente der Paulinischen Briefe* a considerable confusion as to the use of the word "Itala." German writers as a rule use it for the older form of the Latin version before Jerome. The critic, probably with reason, objects to this. But he is himself utterly wrong if he supposes that it has anything to do with the

district from which the *codices* of the Old Latin happen to be derived. True, the two oldest manuscripts of that version have been preserved in the towns of Vercelli and Verona. But it is quite certain that these two famous documents represent an African, and not an Italian form of text (cf. Rönisch, *Italia u. Vulgata*, p. 5). Of the other manuscripts mentioned, the Brecian perhaps does represent what was probably the true "Itala," but the fragments at St. Gall are African, and the lectionary at Luxeuil (we suppose that this is meant) is based on the Vulgate, and has nothing to do with the matter. The critic is also quite wrong in saying that before the discovery of these fragments "nothing of the Versio Itala was known beyond the Gospels."

In the *Church Quarterly Review* there is an article on the Ancient Egyptians, by a writer who seems well acquainted with the monuments, and believes they bear out Ussher's Chronology within a couple of centuries or so. The article on Gervase of Tilbury calls attention to the strange fact that a learned layman, in high employment, of good judgment in practical things, should have collected incredible stories in good faith in the two parts of Europe he knew best—East Anglia and the kingdom of Arles.

ANOTHER volume of the *Chronicles of the German Cities from the Fourteenth to the Sixteenth Centuries*, edited under the direction of Professor Hegel for the Historical Commission of the Royal Bavarian Academy of Sciences, has just been issued at Leipzig. It includes the shorter chronicles of the Lower Rhine cities, and among others gives Gottfried Hagen's Rhyme-Chronicle between 1277 and 1287.

SOME very interesting original unpublished letters of the Fairfax family will be sold by Messrs. Sotheby and Wilkinson in October next.

DR. DUNCER's *History of Antiquity* is being translated by Mr. Evelyn Abbott, of Balliol, and will be published by Messrs. R. Bentley and Son.

THE Hon. Roden Noel will have a poem, entitled "Thalatta," in the August number of the *Gentleman's Magazine*; and Mr. Hepworth Dixon will print in the same number the first instalment of a new work on "The Recovery of Palestine."

At a special general meeting of the Royal Society of Literature, held on the 19th inst., Prince Leopold was elected to succeed the late Bishop Thirlwall as President.

THE accompanying account of the death of Oliver Cromwell appeared in the Government organ of the day—the *Mercurius Politicus* for September 2-9, 1658. It was no doubt the first printed intelligence which reached the people outside London of the loss England and the world had suffered. It has a sad interest to us now as a calm and pathetic record of one of the most memorable events in history. It is also not without some literary value as a specimen of rich and beautiful English, which appeared in the pages of a newspaper at a time when the writing in such places was almost always, as far as style went, of the very lowest order:—

"Whitehall, Sep. 3.

"His most serene and renowned Highness Oliver Lord Protector, being after a sickness of about fourteen days, (which appeared an ague in the beginning) reduced to a very low condition of body, began early this morning to draw near the gate of death; and it pleased God about three a clock afternoon, to put a period to his life. I would willingly express upon this sad occasion, the deep sorrow which hath possessed the mindes of his most noble son and successor, and other dearest relations, had I language sufficient: But all that I can use, will fall short of the merits of that most excellent Prince. His first undertakings for the public interest, his working things all along, as it were out of the Rock, his founding a military discipline in these nations, such as is not to be found in any example of preceding times; and whereby the noble soldiery of these nations may (without flattery) be commended for piety, moderation, and obedience,

as a pattern to be imitated, but hardly to be equalled by succeeding generations; His wisdom and piety in things divine, his prudence in management of civil affairs, and conduct of the military, and admirable successes in all, made him a prince indeed among the people of God; by whose prayers being lifted up to the supreme dignity, he became more highly seated in their hearts, because in all his actions it was evident, that the main design was to make his own interest one and the same with theirs, that it might be subserving to the great interest of Jesus Christ. And in promoting of this his spirit knew no bounds, his affection could not be confined at home, but brake forth into foreign parts, where he was by good men universally admired as an extraordinary person raised up of God, and by them owned as the great Protector and Patron of the Evangelical profession. This being said, and the world it self witness of it, I can onely adde That God gave him blessings proportionable to all these virtues, and made him a blessing to us, by his wisdom and valor to secure our peace and liberty, and to revive the antient renown and reputation of our native country.

"After all this, it is remarkable, how it pleased the Lord, on this day to take him to rest, it having formerly been a day of labors to him; for which both himself and the day (Sept. 3) will be most renowned to posterity, it having been to him a day of triumphs and thanksgiving for the memorable victories of *Dunbar* and *Worcester*; a day which after so many strange revolutions of providence, high contradictions and wicked conspiracies of unreasonable men, he lived once again to see, and then to die with great assurances and serenity of minde, peaceably in his bed.

"Thus it hath proved to him to be a day of Triumph indeed, there being much of providence in it, that after so glorious crowns of victory placed on his head by God on this day, having neglected an earthly crown, he should now go to receive the crown of Everlasting Life."

OBITUARY.

HEARDER, Dr. Jonathan, at Plymouth, July 16.
RUMFEL, Alexander, at Edinburgh, July 18, aged 62. [Editor of the *Scotsman*.]

NOTES OF TRAVEL.

THE more detailed information respecting M. Gessi's voyage round the Albert Nyanza which has now been received may be considered to have set at rest the vexed question of a possible union of the Albert and Tanganyika Lakes; but it opens up a new field of doubt and speculation, in reporting that the Nile after leaving the Albert splits into two branches at 100 miles south of Dufli, one of which is the known Nile of Gondokoro, the other a channel 200 yards wide, going off with a good current to the north-west, and said by the natives to go to a great distance. General Gordon's view, that this unexplored river may be the river Jaie or Jeji, which joins the Nile at Rabat Chambe, has greater probability than any other, though it scarcely agrees with F. Morlang's report of the origin of the Jeji from accounts given him on its banks in 1859, that it "comes from a mountain named Lero or Bero, far in the south, in the neighbourhood of which the Chufiri (White River) springs," and that the tribe of the Lókak live about its sources. Another speculation, that the newly-discovered channel may be the Uelle of Schweinfurth, has still less support, since that traveller described his river as having all the characteristics of a mountain stream.

A VERY important scientific society has newly been founded in Portugal with the title *Comissão Central da Geographia de Lisboa*. Its object, besides that of encouraging the cultivation of present geography, is to search out and publish, as our Hakluyt Society does, the earlier voyages and travels. The secretary, after visiting Paris and Amsterdam, has been in London soliciting correspondence, exchanges, and cooperation with other societies.

THE King of the Belgians, taking a strong interest in the progress of African exploration, has issued invitations to the leading representatives of

the European Geographical Societies to meet as his guests in Brussels in September. The question of the best method of procedure in the task of opening up the great African continent to knowledge and profitable commerce from the east and west coasts will then be discussed, sites will be determined on for fixed stations to serve as bases of operations and depôts, and ultimately a committee of ways and means will be formed to put the resolutions of the geographers into practical operation.

THE second number of the quarterly *Bulletin de la Société Khédiviale de Géographie du Caire* for February to June contains an important chapter on the progress of geography in Algeria from 1868 to 1871, extracted from an unpublished work by M. H. Duveyrier, the brilliant explorer of the Algerian Sahara. The article deals minutely with the advances made in topographical work, in knowledge of the Berbers, and of prehistoric monuments in Algeria, concluding with an account of the recent explorations in Morocco. Colonel Long, of the Egyptian Soudan Expedition, contributes important notes on the negroes who inhabit the country between the Bahr el Abiad and the Equator, and westward to the Makraka and Niam-Niam region, derived from his recent journeys thither.

GUIDO CORA's *Cosmos* announces the return to Europe, in the month of June, of the well-known naturalist and explorer, Odoardo Beccari, after four years and a half of sojourn in Eastern Malaysia and New Guinea. He has come home to publish an account of his many journeys, and to arrange his great botanical and zoological collections. The notes of a journey to Borneo, continued in this July number, by Giacomo Bove, describe his ascent of the Kini-Balu, the great mountain of Northern Borneo.

THE Eighth Annual Report of the Geological and Geographical Survey of the Territories, under the direction of Prof. F. V. Hayden, has lately been issued from the U. S. Government Printing Office. It is a report of progress of the explorations, mainly in Colorado, for the year 1874, and contains twelve articles in 500 octavo pages, and eighty-eight illustrations, including maps and sections. It commences with an introductory letter to the Secretary of the Interior, under whose auspices the Survey is conducted, which contains a general account of the organisation of the various field divisions, and the progress of the work. Following this is the part devoted to geology, mineralogy, and mining industry, containing the reports of Prof. Hayden, William H. Holmes, Dr. A. C. Peale, Dr. F. M. Endlich, and Samuel Aughey, Ph.D. Dr. Hayden's report is devoted to the special geology of the eastern part of the Rocky Mountains in Colorado, the Arkansas Valley, and portions of the Elk Mountains. The report of A. C. Peale gives the general and special features of the district assigned to the middle division of the Survey, viz., the country lying between the Grand and Gunnison rivers west of the 107th meridian. Dr. F. M. Endlich reports on the San Juan country, giving chapters on its metamorphic, volcanic, and sedimentary areas and mines of the region. All these reports are abundantly illustrated with wood-cuts, sections, and geological maps. Samuel Aughey has an interesting and practical report on the superficial deposits in Nebraska. The second paper is devoted to palaeontology, and contains papers on the flora of the lignitic formations of North America, by Leo Lesquereux. A large number of new fossil plants are described and illustrated in eight plates. Following the palaeontology is the report of W. H. Jackson on the ancient ruins of South-western Colorado. Eight plates of the cliff-houses, cave-dwellings, and other ruins of the Mancos, McElmo and Hovenweep rivers accompany the report. Following Mr. Jackson's interesting report is an article on the zoological work for 1874. It contains descriptions and

figures of several new species in conchology. The last division of the volume comprises the portion devoted to topography and geography, containing the following reports: Henry Gannett's on the middle district; S. B. Ladd's on the northern district, and A. D. Wilson's and Franklin Rhoda's on the San Juan or southern district. These reports give the general topographical features of the areas surveyed, the means of communication and elevations of principal points: a complete table of contents and exhaustive indexes accompany the report; there is a general index of systematic names.

A FORGOTTEN CIVIC OFFICE.

AMONG the various claims sent in to the Epping Forest Commissioners by different persons of rights over the forest was one by the Mayor, Aldermen, and Commonalty of the City of London that "they and their predecessors, from time whereof the memory of man is not to the contrary, have had, and still of right ought to have, a right of hunting in the said forest, by themselves, their families and servants, beasts of the chase and forest." This claim of the City to hunt—which is said to be the origin of the Cockney Saturnalia that take place every Easter Monday—is based upon documents extending as far back as William I., and although the relevancy of the documents to the claim as now made may be a matter of some doubt, yet still the history of the claim is curious, and it brings before us one of the ancient officers of the City, at one time a very important personage but now not known even by name to the vast majority of the citizens—"Mr. Common Hunt."

That the City had a right to hunt from a very early date appears from the charter of William I., which prohibits their hunting on Archbishop Lanfranc's land at Harrow. In the charter of Henry I., in 1101, the right is recognised as an ancient one:—"The citizens of London shall have their chases to hunt as well and as fully as their ancestors have had, that is to say, in Chiltre, Middlesex, and Surrey." Where Chiltre was seems a very doubtful point, but this right of hunting was confirmed by the charters of Henry II., Richard I., John, and Henry III. In the 3rd Edward I., 1275, an inquisition was taken as to the privileges claimed by the City of London, and as to the ward of Simon de Harestoke it was found—

"that the liberty of the City of our Lord the King is such that the citizens may run with their dogs at hares, foxes, rabbits, and mousers, as far as the Bridge of Stanes, and to the gate of the Park at Enfield, and to Stratford le Bow, and to the Cross of Walham, but the liberty is impeded by the Earl of Cornwall's warren at Hisleworth, and the warren of William de Sey at Edmonton."

There are several other mentions made of this right in Edward I.'s reign.

Mr. Common Hunt is met with as far back as Richard II.'s reign, and his office is then spoken of as an ancient one. In Henry VI.'s reign, on April 21, 1480, a complaint was made that the Abbot of Stratford had prohibited the Common Hunt at his peril from presuming to hunt on any of his lands in any way whatever. In a few days after the Abbot came before the Court of Common Council and said that the prohibition was by one of his tenants, contrary to his will and knowledge.

In the 13th Henry VIII. we get the oath that the Common Hunt took on his admission to office:—

"The othe of William Rolte Sergeant of Armes to the Kyng's Grace late electe by the Mayre and Commonalties Common Hunt of this cite in the stede of Arnolde Balyngton late deceased taken in the Inner Chamber of Guyhalde before the Mayre and Aldermen upon Seignt Edwardes Day in the XIIIth year of the reigne of Kyng Henry the eyght Ye swore that

ye shall well and truly to the best of your pouer mayntayn [and] keep fraunchises of hunting that belongen and of olde tyme have apperteyned and belonged to the others the of the same. Ye shall not knowe nor consent to eny liberte of otherwise to be streyed denyed or withdrawn contrary to the liberties of the but to the uttermost of your power ye shall withstand concerning your sey office as the common wale or liberte of the sey(d) cite will best of your pouer att all tymes ye shall behave your self in all things."

It seems that the expense of keeping up a large body of hounds weighed upon the City, for in 1558 the Common Hunt was ordered to "put away so many of their worste houndes that they nowe have and from henceforthe shall breake but iiii cople of haryers and iiii cople of other houndes which other houndes they were commandyed to provide with spede."

It was not only hounds that Mr. Common Hunt had to provide, he had also to keep hawks; in the 11th Elizabeth an order was made directing "the Common Hunt to keep a long wing Hawk a goshawk a tassell of a goshawk and a kennell of spaniels for the Lord Mayor aldermen and commonalty of this City."

The City "Dogg House" was situated somewhere in Finsbury Fields, near where Worship Street now stands, and we find entries directing various sums to be spent upon it, to put it in a proper state of repair.

In 1688 we find a new Common Hunt admitted, who, it is stated, took the oaths and subscribed the declaration mentioned in the late Act of Parliament. This was probably the declaration against Transubstantiation. Even a huntsman was required to be a good Protestant.

In 1698 we find a grant of 40*l.* made to Mr. Common Hunt "for green velvet and all other appurtenances for himself Yeoman Hunt & servant upon his Majesty's public entry into the City on his return from Flanders."

A great dispute seems to have taken place about 1705 between the City and Mr. Wroth, an Essex magistrate, who disputed the right of the City to hunt in Epping Forest, and wanted to send one of his huntsmen abroad to serve with the Duke of Marlborough under "an Act for recruiting Her Majesty's Land Forces." Although the office was continued, the City does not from that time seem to have taken much interest in hunting. Mr. Common Hunt retained the office, but kept no hounds—in fact, became a sinecurist—and in January, 1746, the Common Hunt was ordered to attend to answer a complaint made against him for not keeping hounds for the use of the City. The result of the complaint was a committee to enquire into the matter. They set out the Common Hunt's duties: first, to keep a pack of hounds; secondly, to attend the Lord Mayor at the Mansion House weekly on Mondays and Wednesdays; and, thirdly, every third Sunday to usher the Lady Mayoress. (How grand his green velvet and appurtenances must have looked in contrast with the blue and gold liveries of the City!) Mr. Common Hunt admitted that he owned no hounds; that he allowed a gentleman's huntsman 7*l.* a year to provide him a pack upon occasion; that he only did as his predecessor had done; and that he had lost 2,000*l.* by the purchase of his place. It appears that at that time all the City offices were sold: half the purchase-money went to the Mayor; each of the sheriffs took a quarter.

The sheriffs reported that a pack of hounds ought to be kept to support the City's ancient right of hunting.

But a reforming spirit seems to have been abroad in the City, and though Mr. Common Hunt escaped for a time, it was only for a time. In 1807 another attack was made upon him. The Court of Common Council took the opinion of the Recorder, Sir John Sylvester, the Common Sergeant, Mr. Newman Knowlys, and Mr. Valiant, as to the propriety of abolishing the office of Common Hunt. They advised that the City could of course resign its franchises if it pleased,

but strongly advised them not to do so. They stated:—

"The household of the Lord Mayor was formed in close resemblance to that of the Sovereign, for the purpose of maintaining the state and dignity of the first city of the Empire. The household establishment of the Sovereign contained in it an officer to mark out peculiarly his prerogative of chase, of which other sovereigns of old were more proud and jealous than of any other branch of their prerogative. That officer was the Grand Falconer, and though the pursuit of game by the mode of hawking has been in disuse for a century past, this office is still retained in the Royal establishment, is an office of very high dignity, and filled by one of the first peers of the realm, the Duke of St. Albans. The Sovereign has other inferior officers of the chase, as the Master of the Buckhounds and others which it would be needless to mention. The office of Common Hunt is the only badge of participation in the high prerogative that exists in the state of the City of London, as represented in the household establishment of the Chief Magistrate, on account of the great estimation in which the right of chase was held. The Common Hunt took place as the second esquire of the Lord Mayor's household."

But, notwithstanding this highly flattering opinion—the comparison of the Lord Mayor with the Sovereign; of Mr. Common Hunt, living in his Dogg House in Finsbury Fields, with the Hereditary Grand Falconer—economical and utilitarian views prevailed; and on July 21, 1807, the Common Council resigned to the Crown the privilege of having a person to exercise their privilege of chase, by passing a resolution "that the office of Common Hunt should be abolished, and it was abolished accordingly."

CORRESPONDENCE.

"LANGUAGE A TEST OF SOCIAL CONTACT, NOT OF RACE."

Samoa, South Pacific: April 18, 1876.

Some months ago I saw notices of a paper on the above-named subject, which was read by the Rev. A. H. Sayce, M.A., before the Anthropological Institute on May 11, 1875. I have not seen Mr. Sayce's paper, and I know it only from the brief abstracts in the newspapers. But some of the statements there given have exercised my mind very frequently since I read them; such, e.g., as the following:—"Language could tell us nothing of race. It did not even raise a presumption that the speakers were all of the same race."

In looking over the world for facts for or against the above statement, I can see very much in its favour in Europe and America. From the notices I have seen, I conclude that Mr. Sayce relied chiefly on European evidence in support of his thesis. But it strikes me that its validity would be best tested by reference to the languages and social conditions of the less civilised portions of the world. Perhaps no better portion of the world for this purpose will be found than Polynesia, and I naturally wish to assay Mr. Sayce's metal in my own crucible. Allow me, then, to try a few Polynesian tests.

The grammar of the dialects spoken by the brown Polynesians (Malayo-Polynesians) is well known to be very similar, however widely separated the islands may be. They are dialects (I use this word in a restricted sense) of one language. I will give here one example only.

All these dialects use a *causative prefix*, like the Hebrew Hiphil. This is one of the most prominent features of the language. It assumes different forms in different dialects: e.g., in the Maori of New Zealand it is *Wha-ka*; in Hawaiian, *Ho-o*; in Samoan, *Fa-a* (the comma before the second vowel there, as in all other Samoan words, represents a sound something like a very hard aspirate); in the Ellice and Tokelau dialects, *Fa-ka*; in Tahitian, *Ha-a* and *Fa-a*. It is prefixed to substantives, adjectives, and verbs neuter, and by it they are changed into verbs active. Thus *tu-pu* (to grow) becomes in Samoan *fa-a-tu-pu* (to cause to grow); in Tahitian, *Fa-a-tu-pu* and *Ha-a-tu-pu*; in Maori, *Wha-ka-tu-pu*; and so on in other dialects.

I might bring forward many words which have a common, or very similar, form in most of the dialects, especially substantives which are in frequent use. I will notice two only. The name for fish (Malay, *I-kan*) is in the Maori, Tongan, Niuean, and Gilbert Is. dialects, *i-ka*; in Samoan, *i-a*; in Hawaiian and Tahitian *i-a*. A bait for a fish-hook is in Tahitian, Hawaiian, Samoan, Maori, and some other dialects, *ma-u-nu*. That word is one of three used by the Maories. Another word they use is *pa-ra-ngi-a*, and this is found in the Ellice islands under the form of *pa-nge*. In the Tokelau dialect *ma-u-nu* becomes *ma-u-nu*.

Now, what can be the cause of this close resemblance in the dialects used over so extended an area? Is it to be accounted for by "social contact," or is it an indication of the common origin of all these Polynesians? Can the social contact between (say) the Maories of New Zealand and the Hawaiian Islanders in the North Pacific (they are separated by 60° of latitude and 30° of longitude!) have been so close as to have led to this intimate assimilation of their languages? We know nothing from actual history, and next to nothing from tradition, which would warrant us in accepting it as possible.

I must therefore conclude that the Polynesian test shows Mr. Sayce's statement to require considerable modification. I would not assert that *language alone* is a "sure and certain test of race." But I would maintain that it is a most important factor which can never be safely disregarded in ethnological researches. Even where there has been a considerable mixture of races, I believe the language which results may be resolved into its elements by the philological analyst, almost as certainly as a chemical compound may be resolved into its elements by the chemical analyst.

S. J. WHITMEE.

A SONG BY BISHOP PERCY.

Chelmarsh Vicarage, Bridgenorth: July 15, 1876.

My attention has been recently drawn to the ACADEMY for July 1, in which a letter from Mr. Wheatley appears in reference to Bishop Percy's song:—

"O Nancy, wilt thou go with me,"
as he quotes the first line.

The date that he is able to assign to it—viz.

1758—shows clearly that I was in error in my little biographical sketch of Percy prefixed to the reprint of the MS. folio, in endorsing the statement of Miss Laetitia Hawkins that it was addressed to Mrs. Percy on her return from the royal nursery in 1771. Mr. Wheatley also points out the anachronism committed with regard to the date of the birth of Prince Edward, afterwards Duke of Kent, who was born in 1767, and not in 1771.

Yet I do not think that Desborough, at the church of which place Mrs. Percy was married in 1759, was much more than a quiet country village, or that she was quitting much gaiety or society in leaving it as a bride for that of Easton Maudit. Her name was Anne Gutteridge, afterwards altered by Percy to Goodriche, and may still be seen spelt in this way on her monument in Dro-more Cathedral. "Nanny" was, and is still to this day, a familiar abbreviation of Anne in the county of Northampton, where Desborough and Easton Maudit are situated. A picture of Mrs. Percy hangs at Ecton Hall, near Northampton, the seat of her grandson, Ambrose Isted, Esq., in which she is represented as holding in her hand a scroll, on which a line from this pretty ballad is inscribed. As to Percy having borrowed the idea from a song in Nat. Lee's *Theodosius, or the Force of Love*, commencing:—

"Can'st thou, Marina, leave the world,
The world that is devotion's bane?"

I never believed that he did so. If there is any coincidence, it is, in my opinion, quite undesigned and accidental, and a reference to the memoir will show that the note attributing plagiarism to Percy does not owe its paternity to my pen.

The "old house at home" where Percy was born is still in existence in the Cartway at Bridgenorth, close to the Severn, occupied at this present moment by an ironfounder, and I heard that a short time ago it only fetched at a sale 150*l*. There is considerable doubt as to whether Percy was educated at the Grammar School of his native town, for a note in Boswell's *Life of Johnson* mentions that he was a pupil at Newport School, in the county of Salop, then under the management of the Rev. Samuel Lea, M.A., a very able schoolmaster. JOHN PICKFORD.

SCIENCE.

Annual Report of the United States Geological and Geographical Survey of the Territories, embracing Colorado and parts of adjacent Territories; being a Report of Progress of the Exploration for the year 1874. By F. V. Hayden, United States Geologist. (Washington: Government Printing Office, 1876.)

The Vertebrata of the Cretaceous Formations of the West. By E. D. Cope. (Washington: Government Printing Office, 1875.)

If proof were needed of the energy with which Dr. Hayden and his fellow-workers are carrying on the scientific exploration of the Western Territories, it would surely be sufficient to point to such volumes as those outspread before us. Here are two books of no mean bulk, and of value fully commensurate with their bulk; the one an octavo of five hundred pages, telling us what work has been accomplished by the Survey in the course of a single season; the other an imposing quarto of three hundred pages, describing in detail a group of fossils which are just now of especial interest. These volumes, however, are merely types of the works which have been and are still being issued by the Survey—a fact which makes

them not a whit the less but rather the more noteworthy. It is difficult, indeed, to know which to admire most—the energy with which the field-work is carried on in the face of huge physical difficulties; or the way in which the results of this work are given to the world, promptly in the small Bulletins, and then fully in these solid Reports and Monographs; or, finally, the liberality with which the volumes are distributed wherever they are likely to advance the cause of science.

In Dr. Hayden's Report we find an excellent account of the nature and extent of the survey-work carried on in Colorado during the season of 1874. Radiating in various directions from Denver as head-quarters, the exploring parties penetrated into districts of which in some cases absolutely nothing was known geologically, and next to nothing topographically. The geologist who has to work in an almost virgin country, like certain districts in the Far West, encounters difficulties utterly unknown to those who have the luxury of good maps to work upon; he does not simply follow in the wake of the topographer, but the two must needs work together hand in hand. We admire the energy, while we pity the labour of those early microscopists who had to grind their own lenses, to construct their instruments in fact, before making scientific observations. In like manner the surveyor in the great West has to construct his topographical map before he can lay down his geological lines, and the Survey thus becomes at once geological and geographical. But it is even more than this. For the reports show that neither natural history nor meteorology, nor even archaeology, is neglected. In short, nothing of interest seems to come amiss to these pioneers of science in the West.

To those whose interest in a country centres in its subterranean riches, Dr. Endlicher's remarks on the San Juan Country will certainly be the most acceptable part of the Colorado Report. The tract of rugged country supposed to contain most of the metalliferous lodes was purchased from the Ute Indians by the United States Government in 1873. Numerous veins of argentiferous galena and silver-fahlerz cut through the volcanic and metamorphic rocks of the country; but at the time the surveyors paid their visit the workings were too shallow to allow any conclusions to be drawn as to the ore-bearing character of the veins in depth.

While the practical man may be attracted to that portion of the Report which we have just indicated, the scientific student will assuredly open the volume at those chapters which discuss the much-vexed question of the age of the Western lignites. As the point in dispute has by this time become famous not only in America but even in Europe, it may be well to explain to the English reader the present position of the case.

Little was known of the Western coal-beds until Dr. Hayden in 1854 explored the Upper Missouri. He showed, however, that the "Lignitic Formation," as it is now termed, is one of vast importance, its area in that region being not less than one hundred thousand square miles. It is not only of great extent in the North-Western States,

but it stretches beyond the limits of the States far into British territory. The formation is supported by the uppermost Cretaceous beds—the Fox Hills group, and Dr. Hayden, in common with many other geologists, assigned it without hesitation to the Tertiary period. Nor was the evidence of fossils lacking to support this view. Indeed, large quantities of both animal and vegetable remains were collected in various parts of the North-West, and studied by such competent palaeontologists as Dr. Leidy, Dr. Newberry, Mr. Meek, and Prof. Lesquereux. The botanist last named has contributed to the present Report a description of specimens collected from Point of Rocks in Colorado, and reviews the evidence of the age of the plant-bearing beds, while Dr. Hayden discusses the whole question of age with great fullness and fairness.

But while the lines of evidence derived from stratigraphical position, from the character of the fossil plants, and from that of the invertebrata, all converge to the conclusion that the lignitic group is of Tertiary age, this conclusion is directly at issue with that which Dr. Cope derives from studying the vertebrata. Among these fossils he finds characteristic Mesozoic reptiles belonging to the orders *Dinosauria* and *Sauropterygia*; and, as seen by the title of his monograph quoted above, he regards them as Cretaceous forms. These and other fossils are technically described and beautifully figured in Dr. Cope's work, the description being preceded by a philosophical essay "On the general significance of the Science of Palaeontology." As Dr. Cope is as confident about the age of his fossils as the palaeobotanists are about theirs, it seems that the only way to reconcile the opposing opinions is by admitting the contemporaneity of a Tertiary flora with a vertebrate fauna of Cretaceous type. In this way a transition may be established between the Mesozoic and Cainozoic formations. And the belief in such a transition is supported by stratigraphical evidence. In passing upwards from beds of undoubtedly Cretaceous age we may mark a gradual change in the physical conditions under which the strata were laid down—a change from marine conditions first to brackish, and then to the fresh-water conditions of the Tertiary deposits. The Cretaceous sea grew shallow, and the lignitic beds were ultimately formed in a vast body of fresh-water, thus truly constituting what Dr. Hayden has called a "Transition Series." Between the Secondary and Tertiary formations we generally expect to find one of the greatest gaps in the geological series; and the suggested bridging-over of this gap is itself one of the most interesting results of the Survey of the Western Territories.

F. W. RUDLER.

languages treated of are the Hindi, Panjabi, Sindhi, Gujarati, Marathi, Oriya, and Bangali. Many of Mr. Beames's readers in this country will, perhaps, be interested in the opportunity they will have of comparing these languages with the Romance languages. Both groups are derived from languages which had been highly cultivated—the one from the Sanskrit, the other from the Latin—and though Sanskrit probably ceased to be the language of the majority of the people for some centuries before Latin, yet the modern languages in each case appear to have come into existence in all essential respects the same as we now find them much about the same time, the intermediate period having been occupied in the one case by the Prakrit dialects, in the other by the *lingua romana rustica* or popular Latin, which like the Prakrits had lost much of the old synthetic structure. In both cases there is evidence that, even before this intermediate period, there was a popular language distinct from the literary, and in both cases the modern languages are ultimately derived rather from this popular than from the literary language. In both cases again the literary language was used by the learned long after it had ceased to be commonly spoken.

There are many points of resemblance in the development of the modern Indian and Romance languages. They have both cast off most of the distinctive inflexions of the old declensional system, and also made great changes in the same direction though not to the same extent in dealing with the verbs. The original gender is in both groups an important guide to the gender of the modern noun. Three of the Indian languages, Hindi, Panjabi, and Sindhi, have, like the Romance, dispensed with the neuter; Gujarati and Marathi have retained all three genders; while Bangali and Oriya have no distinction of gender at all, according to Mr. Beames (p. 147), in the common language. Mr. Beames remarks that the Prakrits, like the Sanskrit, have all three genders. The Sanskrit neuters, however, have already begun to pass into masculines in the principal Prakrits, while in the Apabhraṃśa, "the lowest of all the Prakrit dialects," the neuter, according to Trumpp (*Sindhi Grammar*, p. 32), has been discarded altogether. In this respect, therefore, the Apabhraṃśa resembles the Low Latin, which was also without the neuter gender.

In most of the languages of the Indian group, the other relations of case are distinguished from the nominative by a difference of form, and the forms of the oblique plural, it can hardly be doubted, are derived ultimately from the genitive plural of Sanskrit nouns in *-a*; it is more especially as regards the oblique of the singular that Mr. Beames concludes (pp. 210, ff.) that this case has been produced by a general fusion of all the oblique cases of the Sanskrit; but even Mr. Beames's own explanation seems rather to point to the genitive singular of the same nouns as being the origin of most of the modern forms, and it seems contrary to the analogy of other languages to suppose that any mixture of case-endings ever takes place. In the Romance languages all dis-

tinction between a direct and oblique form has been lost, but in old French and Provençal the distinction existed, where the oblique was derived from the Latin accusative, which is the origin generally of the present form of the nouns in the Romance languages. Again, the Indian and Romance groups agree in deriving their plurals from the old forms—from the old Sanskrit-Prakrit and from Latin plurals, respectively. The personal pronouns of both groups also resemble each other in preserving the remains of old case-inflexions which have disappeared generally from the noun.

Again, as regards the accent, Mr. Beames suggests that the Sanskrit accent had, to a great extent, the effect of preserving the syllable on which it rested, especially in the very large class of nouns derived from Sanskrit nouns in *-a*. It appears, according to this suggestion, that if the accent in nouns of this class was on the stem-vowel in Sanskrit, we have a long vowel in the modern languages—namely *o* in Sindhi and Gujarati, and *ā* in the other languages—but if the accent fell on the root-vowel, then the stem syllable is lost in the modern languages, with the exception of Sindhi, and occasionally of Gujarati, in which the final *o* of the other form is weakened to short *u*. The uniformity with which, on the whole, this division of the Sanskrit nouns in *-a* is maintained in all the modern languages is very remarkable; but there are many exceptions, which are not always satisfactorily accounted for, to the rule that has been suggested, that the division is caused by the position of the accent in Sanskrit. If this be the rule, however, the Indian languages may then in this respect also be compared with the Romance, where the Latin accent has left its mark very decidedly, and especially with the French, the accented syllable being often the only one saved in that language.

The earliest modern Aryan author whose work has been preserved is the Hindi poet Chand, who wrote about the end of the twelfth century. Mr. Beames (p. 25) gives a quotation from the hymn to Ganesh, from which it appears that it is necessary to pronounce a short final *a* in two places in the one line quoted, in order to make the line scan, which *a* is not heard in the pronunciation of the present day. Mr. Beames here remarks:—"The final vowel is, however, often merely inserted to eke out the metre." Here, we think, perhaps Mr. Beames is in error. We must not too hastily conclude that the poet had recourse to any such arbitrary proceeding. Further investigation might establish the probability at least of the *a* being pronounced in Chand's time in all cases where it is required by the metre. In the instances given by Mr. Beames the short *a* stands in the place of terminations of the Sanskrit that have been lost, and the same appears to be the case in other lines of this poet quoted by Mr. Beames in other parts of his book. It was formerly thought that our own Chaucer inserted a final *e* at pleasure. The *e muet*, again, of the French, which always stands for an older termination, was formerly pronounced, is still required to complete the metre in poetry, and is always pronounced in singing. In Bangali and Oriya, according to Beames, the short final *a*,

A Comparative Grammar of the Modern Aryan Languages of India. By John Beames. Vol. II. (London: Trübner and Co., 1875.)

VOLUME I., which was on "Sounds," was noticed in a former number of the ACADEMY (October 15, 1873). The present volume deals with the Noun and Pronoun. The

lost in Hindi and also in Panjabi, Marathi and Gujurati, is very slightly pronounced. These languages, therefore, so far resemble the German of the present day, where the final *e* is still pronounced, though it is no longer heard in English. In Sindhi every noun must end in a vowel, and therefore Sindhi so far resembles the Italian; and these vowel-endings have not been arbitrarily assigned, but depend, as in Italian, upon the terminations of the words of the ancient language from which they are derived.

We will mention one more point of resemblance between the two groups, and that is the way in which the old compound consonants are treated. The Sindhi and Panjabi, and also the Prakrits, agree generally with the Italian in assimilating one consonant to the other; while in the other Indian languages, and in the French, one of the two compound consonants, usually the first, disappears, and in the case of the former languages a preceding original short vowel is almost always lengthened. To give one instance only of what is meant, we have Skr. *dugdha*, "milk," and Lat. *lactem* (acc. for *lac*); P. *dudh*, It. *latte*; but H. *dudh*, Fr. *lait*. Or the old consonants are sometimes retained in the Indian group, and a vowel inserted to facilitate the pronunciation, with which we often find some correspondence in Italian; thus Skr. *śabda*, "noise," H. *sabad*, Lat. *spasmus*, It. *spasimo*.

The most striking contrast between the two groups is perhaps in this, that the relations of case are expressed in the Indian group by postpositions, in the Romance by prepositions. It is owing to a fancied resemblance between the Hindi, Bangali, &c., and the aboriginal languages, as regards a portion of their grammatical apparatus, and especially postpositions, that the extraordinary notion has arisen, and still prevails, that the grammar of the former is non-Aryan. "All these languages," writes Sir J. Lubbock (*Or. Civ.*, 3rd ed., 1875, p. 181), "are said to be Sanskrit as regards their words, aboriginal on the contrary in their grammar." Mr. Beames, however, shows as regards the nouns and pronouns, which are all the present volume deals with, that this is not the case; and still less will such a conclusion hold good with reference to the verbs, as will doubtless be shown by Mr. Beames in his forthcoming volume. The Sanskrit inflected locative of the *-a* nouns is still in use in several of the languages, and there are also traces of the old instrumental case; and Sindhi has a synthetic ablative derived from the Sanskrit. The relations of nouns, however, are generally expressed by postpositions. These are of two classes, as they are added directly to the oblique form of the noun or to the modern genitive, the former class signifying generally, though not always, the same relations as those expressed by the cases in Sanskrit. Most of the postpositions are shown beyond all dispute to be of Sanskrit-Prakrit origin. The only reasonable doubt regarding the rest is to which of two or three possible earlier forms in each case they should be referred. The Persian and Pashtu, which are also members of the Indo-European family, occupy an intermediate place between the modern Indian and the Romance languages, as some of their

case-relations are expressed by prepositions, others by postpositions.

The most remarkable formation in the Indian languages is the genitive, which is an adjective in form, and, like the adjective, agrees in gender, number, and case, with the noun. The Hindi genitive-affix *kā*, *ke*, *kī*, is traced back with much probability to the Prakrit *kera*, which has the meaning of "pertaining to." The genitive-affixes, however, are by no means always so satisfactorily referred to earlier forms: for instance, the attempt to refer the Sindhi *jo* and the Marathi *cha* to Sanskrit adjectival suffixes is met by the difficulty, pointed out by Mr. Beames himself, that the latter are added directly to the stem, while the modern forms are added to the oblique case of the noun.

Some of Mr. Beames's conclusions, no doubt, will be disputed, nor is he always consistent with himself. For instance, at p. 286 he refers the Bangali genitive in *-er* to the before-mentioned *kera* of the Prakrit, which he derives again from Skr. *kṛita*, whereas in vol. i. p. 53 he had derived it from the Sanskrit genitive in *-asya*; again, at p. 257, he derives the Hindi dative-accusative *ko* from the Sanskrit *kakṣhe*, whereas in vol. i. p. 48 he had identified it with *kam*, the accusative of Sanskrit nouns in *kah*. He sets aside Trumpp's derivation from *kṛitam*, meaning "for the sake of," &c., which appears to us the more probable source. Mr. Beames is not a trained grammarian, and he sometimes employs words in accordance with no known system of phonetics or of grammar in general. We cannot, however, but be grateful to him for all the information he has collected, and for many of the conclusions he has put before us, and the wonder rather is that a hard-worked District-officer in India, like Mr. Beames, should have been able to do as much as he has done than that his work should not have been of the most finished kind.

E. L. BRANDRETH.

The Assyrian Eponym Canon. By George Smith. (London: Samuel Bagster & Sons, 1875.)

MR. SMITH has produced a valuable book, though it certainly cannot be called light reading. For the first time the English reader has a full account set before him of the evidence upon which the chronology of the Assyrian monarchy rests, and of its bearing upon the contemporary chronology of the kingdoms of Israel and Judah. Translations are given of all the cuneiform documents at present known which contain any chronological data; and too high praise cannot be assigned to the judicial impartiality with which Mr. Smith deals with the various theories and systems that have been built upon them.

The Babylonian and Assyrian Calendar was from a very early period a subject of minute care and attention. Every effort was made, by astronomical observations, by intercalatory months, and by elaborate calculation, to eliminate the chances of error which result from the inequality of the lunar and the solar year. With the Calendar once settled, an accurate chronological

reckoning was an easy matter. Each year took its name from an officer called a *limmu*, whom we may compare with the Eponymous Archons at Athens; and these *limmi*, or Eponyms, generally followed one another in a fixed order, beginning (at all events in the earlier period) with the king. Besides the Eponym date, documents were sometimes dated according to the regnal year of the monarch, and in the time of the old Chaldean empire events like the conquest of some important State or the construction of a canal formed the starting-point of an era. Lists of the Eponyms, or tables of dates as we should call them, were of course preserved with great care, and the British Museum contains fragments of four such, besides the remains of three copies or editions of similar lists to which the titles of the several Eponyms and the occurrences of each year are added. These lists constitute what was termed by their discoverer, Sir H. Rawlinson, "the Assyrian Canon," and they furnish us with a continuous chronology of Assyria from B.C. 909 (supposing the capture of Samaria took place in 720) down to 659. We know of Eponyms both before and after this period, but owing to the mutilated condition of the Assyrian records, we cannot at present fix their exact date. The trustworthy character of these lists need not be pointed out; they could be checked at any moment by contemporaneous documents, and in some cases we can do so still. Owing, however, to the impossibility of harmonising the Assyrian chronology with any one of the numerous chronologies proposed for the Books of Kings, a break of forty years or more has sometimes been assumed in the Canon, though the propounders of the view have not been agreed as to the place in which it occurs. But such an assumption is now regarded as untenable by all competent authorities, and the evidences against it collected by Mr. Smith in the fourth chapter of his book will convince everyone that they are right.

With so complete a chronological system at their command, the Assyrian kings had little difficulty in ascertaining the dates of past events; and we have every reason, therefore, to accept the chronological references of the inscriptions even where the fragments of the Canon at present fail us. Thus Sennacherib states that 418 years had elapsed between his invasion of Chaldea in B.C. 692 and the defeat of Tiglath-Pileser I. by the Babylonians; and the same Tiglath-Pileser, who dates his annals in the Eponymy of Ina-iliya-allik, gives 701 years as the interval between the foundation of the temple of Anu and Rimmon at Assur by Samas-Rimmon I. and his own restoration of it. At the same time, Mr. Smith has done good service in pointing out that critical caution is necessary even when we are dealing with contemporaneous inscriptions. Foreign names are not always given correctly, and in two or three instances the events of one reign or one year are transferred to another.

Of course, the chief interest of this Assyrian chronology lies in its relation to the chronology of the Old Testament, and it cannot be denied that serious discrepancies exist between the two, whatever system of Biblical chronology we may adopt.

Mr. Smith states very fairly the different attempts that have been made to harmonise them, and finally, though with considerable hesitation, propounds his own view. This is that we should accept the evidence of the inscriptions only for Assyrian dates and the evidence of the Bible only for Biblical dates, the chronology of Ussher being adopted for the latter. Herein Mr. Smith deviates from the opinions not only of most other Assyriologists but also of himself at an earlier period; and I must confess that, as it seems to me, second thoughts in this instance are not the best. His theory involves the desperate expedient of rejecting the identifications of "Ahab the Israelite" and "Jehu the son of Omri;" to reject the identification of the last-named, indeed, is an excess of scepticism which defies all the rules of sound criticism. That Pul, again, is Tiglath-Pileser has been abundantly proved by Dr. Schrader; supposing them to be different, the Assyrian monarch was surely the most likely person to know whether the tribute of Menahem was paid to Pul, as the Bible states, or to himself, as his own records assert. Rimmon-nirari has not a letter in common with Pul, with whom Mr. Smith would identify him: it is true, he reads the name Vul-nirari; but the reading Vul is a purely imaginary one, and cannot be supported by the fact that one of the phonetic values of the numerical symbol sometimes used to represent the god Rimmon was *pur* or *bur*. If mistakes occur in the contemporary State-annals of Assyria, *a fortiori* may they be expected to occur in the Books of Kings, and it has long been recognised that the chronology of the latter is in hopeless confusion. It is not so much the Assyrian inscriptions as the phenomena of the Biblical text itself which make me believe that two independent narratives have been mixed together in the account of Sennacherib's invasion: one the campaign of Sargon in the fourteenth year of Hezekiah, and the other the campaign of Sennacherib in B.C. 701; and Dr. Schrader's agreement with me is based upon the same grounds. It is the same reason, too, which would disincline many critics to allow that "the passage in Isaiah xiv., 28, 29, appears to indicate that the death of Tiglath-Pileser took place very near the time of the death of Ahaz."

But, as has already been said, Mr. Smith proposes his system with considerable hesitation, and occupies but a very small portion of his book with an exposition of it. Whatever may be thought of the solution that he has offered of the chronological difficulties, it will in no way diminish the value of his work. For the chronologist and the student of the Bible the volume is more than handy; it is indispensable.

A. H. SAYCE.

REPORT ON THE PROGRESS AND CONDITION OF THE ROYAL GARDENS AT KEW DURING THE YEAR 1875.

THE report from which we extract the following particulars, although dated January 1, has only just appeared. The number of visitors to the gardens exhibits a diminution, compared with the attendance of the previous year, of 21,424; and 56,045 fewer persons visited the gardens on

Sundays. The total number of visitors in 1875 is given as 678,002; and the greatest daily attendance was 61,133, on August 2. During the past year the post of assistant-director was revived, and Mr. W. T. T. Dyer was appointed to fill the post. Through the liberality of T. J. Phillips Jodrell, Esq., a laboratory for physiological, chemical, and microscopical researches is in course of construction. It was originally intended that this laboratory should form part of the group of buildings containing the Herbarium and Library; but, in consideration of the necessity of using gas in it, and the consequent risk of fire, it has been determined to place it in a reserved portion of the gardens, not far from No. 2 Museum, and near the herbaceous collection and the propagating houses. The sum given by Mr. Jodrell amounts to 1,500*l*. Of this it has not been considered expedient to spend more than half on the actual building, leaving the remainder to meet the cost of fittings and apparatus. The whole of the collections of plants in tube and pots in the centre and wings of the Palm House have been rearranged, with the view of removing duplicates and overgrown plants, so as to give more space and light to other plants better worth cultivating. By this means the magnificent specimens of Cycads and Screw Pines, which were more or less concealed, have been brought into greater prominence. An enumeration of all the plants cultivated in pots, tubs, &c., gives, for the permanent collection under glass, about 20,000. This collection Dr. Hooker estimates to contain about 10,000 species. The propagating department contained nearly 27,000 plants; and in addition to these about 10,000 plants are grown for the Ornamental Conservatory. The following plants of especial botanical interest, among others of less importance, flowered during the past year in the Royal Gardens, for the first time in this country:—*Albuccia glandulosa*, *Androsace sarmentosa*, *Anthurium Saundersi*, *Carica candamarcensis*, *Colchicum luteum*, *Columella oblonga*, *Diuris alba*, *Draba hederifolia*, *Ferula (Euryangium) Sumbul*, *Heteranthera limosa*, *Decabelone Barklyi*, *Hoodia Gordonii*, *Lewisia brachycalyx*, *Michekia lanuginosa*, *Nicotiana tabacum* var. *fruticosa*, *Piaranthus flavidus*, *Senecio chordifolius*, and *Theropogon pallidus*. Coloured figures of nearly all of these have been published in the *Botanical Magazine*. Respecting the noble row of old elms that stood by the river-side, at the back of the old Palace wall, the cutting down of which was severely criticised in some of the daily papers at the time, Dr. Hooker fully shows the necessity for their removal in the interests of public safety. One of these having been blown down during the winter, it was found that it had no adequate roots, and had been mainly supported in its erect position by about five feet of ballast that had been used to raise the level of the road; and an examination of the others showed that a very heavy gale might prostrate the whole, and cause immense damage. They have been replaced by young trees, and a parallel row has been planted on the opposite side of the path. Dr. Hooker also calls attention to the rapid ruin of the trees and plantations on the eyots opposite, which serve to mask the gas works and other unsightly buildings belonging to the town of Brentford. In the Pleasure Grounds the collection of shrubby *Polypetalae* (*Thalamiflorae*) has been replanted in prepared beds. The interchange of plants and seeds has been very active, many of the colonies largely benefiting thereby. The Liberian coffee has been successfully sent to all the coffee-growing countries, except Queensland and Grenada, with which Kew is in correspondence. The *Eucalyptus globulus* will probably turn out to be extremely useful for its timber in countries not too hot for its growth. On the Neilgherries, where Australian trees have been largely introduced, one of the most valuable, the *Acacia melanoxylon*, proves to be almost valueless on account of the ravages of Lorantha-

ceous parasites. The *Eucalyptus globulus* is, however, reported by Dr. Bidie to entirely escape their attacks, probably on account of the bark being deciduous. During the present year a careful trial will be made to determine the botanical identity of some of the kinds of tobacco. The India-rubber of Para (*Hevea brasiliensis*) has proved capable of easy propagation at Kew by cuttings, but only a very small percentage of the seed received has germinated. Another caoutchouc-yielding tree, *Castillon elastica*, which the authorities are endeavouring to introduce into India, is equally difficult to raise from seeds. Of 7,000 seeds brought home from Central America by Mr. Cross for the India Office, and transmitted to Kew, none germinated. Fortunately a few plants were secured, and from these it is hoped that a supply will be propagated and forwarded to India during the present year. Steps have been taken to procure a supply of the Mesquit Bean of Arizona (*Prosopis pubescens*), which it is believed will prove extremely valuable for the purpose of cattle-feeding in hot dry countries, such as some parts of South Africa and Australia. Seeds of the interesting *Pringlea anti-scorbutica*, or Kerguelen's Land cabbage, which proved so valuable to the crews of Ross's Antarctic Expedition, were received both from the *Challenger* and "Transit" expeditions, but although a large number of fine plants were raised they have nearly all perished. Among other interesting acquisitions of the garden department during the year we note seeds of *Hibiscus rosa-sinensis*, of Latakia tobacco, of the Asafoetida plant of Persia, *Ferula alliacea*, of African Ammoniacum, of *Phrynium brachystachyum*, of *Nelumbium Leichardti*, also of *Adansonia digitata*, *Kingia australis*, *Flagellaria elegans*, *Decaisnea*, *Cardiopteris lobata*, &c. The museums have also received considerable additions, and a new edition of the *Guide* has been prepared by Mr. Jackson, the curator. The separate collection of specimens illustrating vegetable teratology and pathology commenced in 1874 has been considerably augmented and revised. It comprises at present nearly 300 specimens, and promises to be one of the most interesting features of the museums, no public collection having been hitherto formed to illustrate the diseases and the transformations of the organs of plants. One of the most interesting donations is a fine plant of the singular *Hydnophytum formicaria*, with specimens of the ants (*Camponotus irritans*) which make their galleries in its stems. Very extensive collections and contributions have been received at the Herbarium during the past year. We have only space to mention a few of the more important: the complete herbarium of the late J. Stuart Mill, chiefly South European; the herbarium of the late Rev. R. T. Lowe, containing 1,653 species, fully illustrating the vegetation of the Atlantic islands; collections made by officers attached to the *Challenger* and Transit of Venus Expeditions; a small but interesting collection from Kiukiang, China; Lieut. Cameron's plants from Lake Tanganyika; types of various new species from the Western States of North America; and, finally, Mr. Trail's collections from the Amazon, which are especially rich in palms and insect-tenanted plants.

SCIENCE NOTES.

ASTRONOMY.

The Condition of the Sun's Surface.—Mr. Trouvelot, of Harvard College Observatory, calls attention, in the *American Journal of Science*, to a peculiar feature which he has remarked on the sun's disk during the present period of minimum activity, and to which he gives the name of "veiled spot." These veiled spots are seen through the chromosphere, which is now, according to Mr. Trouvelot, unusually thin, and appear to be openings in the photosphere, where the erup-

tive force is insufficient to disperse the superincumbent hydrogen gas of the chromosphere, which is often in a state of great activity over a veiled spot, as shown by movements of the granules. One remarkable peculiarity distinguishing the veiled spots is that they are sometimes seen in the polar regions, where the ordinary spots are never found, the violence of the eruption being much less at the poles than at the equator. Mr. Trouvelot also remarks on the complicated arrangement of the granules in some parts of the sun, a fact which has been well brought out in photographs taken in this country. For the exhibition of such structure photography is, under proper conditions, peculiarly fitted, and both M. Janssen and M. A. Cornu have recently, in the *Comptes Rendus*, insisted strongly on the importance of this line of research. M. Janssen attaches great importance to the obtaining of photographs on a large scale, though the difficulties increase enormously with increase of size, as the rays have to traverse a greater thickness of heated air in the photo-heliograph, and atmospheric tremors are thereby increased. The question is whether it is better to magnify a photograph of moderate size by means of a lens, or to obtain the enlarged image on the photographic film; M. Janssen prefers the latter process, but certainly hitherto the detail of the solar structure has not been exhibited more distinctly by this method, as photographs on a large scale lose so much in sharpness. In opposition to the views of Mr. Trouvelot, Prof. Tacchini maintains, in the *Comptes Rendus*, that the chromosphere has not diminished so much in height, while the circulation of magnesium is as active as ever, though hydrogen clouds and metallic eruptions are very rare. Prof. Tacchini considers that the absence of sodium in connexion with the present paucity of spots indicates that this substance may play an important part in the formation of spots. The granules and faculae are, however, very marked, and, taking this in connexion with the other facts, Prof. Tacchini thinks we are far from knowing the true cause of the spots, and that it is in any case independent of the rotation of the sun. Padre Secchi's observations agree generally with the above facts, there having been an almost total absence of spots since March, though small pores have been generally visible.

Gases contained in Meteorites.—Prof. Wright, of Yale College, has continued his investigations on the gases given off by meteorites at low pressures and moderately high temperatures, with reference to the connexion between meteors and comets. He has now examined a number of meteorites both of the iron and stony class, and finds this marked distinction between them—viz. that the stony meteorites give off a much larger volume of gas at low temperatures, and that it is chiefly composed of carbon dioxide, there being only a trace of carbon monoxide, while in the iron meteorites, the carbonic dioxide given off is less than 20 per cent. and, with a single exception, much less than the volume of carbon monoxide. The quantity of hydrogen given off is at the same time very much greater than in the case of the stony meteorites, for which it is very small at a temperature below red heat, though it increases greatly in amount as the temperature rises. Prof. Wright concludes that the evolution of such volumes of carbonic dioxide may be taken as a characteristic of the stony meteorites, and that its relation to the theory of comets and their trains is of great significance.

The Tail of Coggia's Comet of 1874.—Signor Lorenzoni has discussed the observations of the tail of this comet, with a view to finding the extent and period of the deviations of its direction from that of the radius vector of the comet, the tail being on the whole nearly opposite to the sun. The conclusions arrived at by Signor Lorenzoni are:—(1) That before

the development of the tail the comet was revolving about an axis of its own; (2) that the formation of the tail produced a change in the distribution of the mass with reference to the axis of rotation; (3) that the tail at once began to rotate round the axis of the comet; (4) that the axis of rotation was by the change in the distribution of the mass made to approach more nearly to the axis of symmetry—i.e., to the direction of the tail—(5) that as the direction of the radius vector in space was continually changing, that of the tail and of the axis of rotation would lag behind it by virtue of the inertia of the cometary matter, and would thus, after a time, make a considerable angle with the direction of the radius vector. This inertia of the cometary matter, combined with the gyratory movement of the tail, would thus account for its apparent change of direction as well as for its curvature.

Change in a Nebula.—The variations in the appearance of a nebula to different eyes and with different telescopes make it very difficult to establish a physical change, though observers in the southern hemisphere hold that such has certainly taken place in the case of the nebula in which the remarkable variable star η Argus is involved. Prof. Holden has lately collected the evidence bearing on the question of change in another remarkable nebula—that known, from its peculiar form, as the Greek omega—and from a careful comparison of the relative positions of the nebula and accompanying stars, in drawings made at different times, he infers that, while the stars and one portion of the nebula show no change, another portion appears to have moved considerably. This may be a veritable change in the structure of the nebula, or it may be a case of proper motion; in either case the fact, if well established, would be of great interest. The drawings examined were:—Herschel's in 1837, Lamont's in 1837, Mason's in 1839, Lassell's in 1862, and finally two by Trouvelot in 1875, with different telescopes, one of 6½ inches aperture, and the other the Washington refractor of 26 inches. Although Prof. Holden does not consider the evidence conclusive as yet, he hopes it will be deemed sufficient to lead to a careful study of this nebula, for future reference, being undertaken—a work for which accurate draughtsmanship is above all things necessary, most of the difficulties of such investigations arising from want of skill in delineating such difficult objects, for which the trained eye of an artist is most desirable.

MICROSCOPICAL NOTES.

In the *Quarterly Journal of Microscopical Science* for July Mr. Jeffrey Bell gives an account of the "Recent Researches into the History of Bacteria," made by, and under the direction of, Prof. Cohn. It appears that Cohn still objects to regarding bacteria as a single polymorphous species, *Escobacteria Septica* (Billroth), but the tendency of investigation is certainly towards grouping together numbers of the lower organisms, even when, as in the cases investigated by Dallinger and Drysdale, the forms they assume at different life-periods appear sufficient for generic or much wider distinctions. Those observers have also shown that it is necessary to study the same objects for months, and even years, to learn all their transformations. Prof. Ray Lankester, in the above-named journal, states in reference to some of these objects that he is continually examining new and varied growths of *Bacterium rubescens*, and that Cohn's separation of it into *Clathrocystis* and *Monas* is untenable. With regard to monads, he would separate from them all objects having only a *post-flagellum*, or vibratile tail. When the *prae-flagellum* is absent, and the *post-flagellum* present, they may be "form-phases of a bacterium." Prof. Lankester mentions other instances in which he differs from Cohn, and we quite agree with him that a higher power than $\times 600$, used by the latter, is required to see

these objects properly. Mr. Bell cites Cohn's proposed classification of bacteria under the term *Schizophytæ*, which he divides into four principal groups, for details of which we must refer the reader to his paper. It may be doubted whether the time for any lasting arrangement has arrived. The observations of Cohn should be compared with those of Dallinger and Drysdale. Dr. Eidam, working in Cohn's laboratory, found from eighteen experiments that there is no reproduction of bacteria at 5° C., but it began to take place, though slowly, at 5½° C.; at 40° C. they fell into a heat rigor, and died at 60° C. "Glass rods dipped in a fluid containing bacteria, and then dried for an hour at 15° C., were brought for a moment in contact with ammonia, alcohol, crude carbolic acid, and acetic acid, and again dried for an hour in the air: the only liquid that proved fatal was the last." In the same journal Mr. Archer discusses "Recent Memoirs on Fresh-water Rhizopoda;" Dr. Thin details observations on the formation of blood-vessels in the omentum of young rabbits; Mr. F. Darwin defends his father's view of the "Aggregation in the Tentacles of Drosera;" Prof. Lankester remarks on the "Shell Gland of the Cyclos and the Planula of Linnaeus;" and Mr. Moseley contributes a note on Mihakowicz's new method of imbedding objects to be cut in thin slices for the microscope. His preparation is made of equal parts of glycerine and gelatine, which form a very tenacious jelly; too much so Mr. Moseley found it for corals, so he added more glycerine. He states that he hardened his corals with chromic acid, absolute alcohol, or osmic acid; decalcified them in weak hydrochloric acid; then soaked them in glycerine, previously staining those hardened in absolute alcohol. The corals were transferred directly from the glycerine to the warm jelly, kept just fluid over a water-bath.

"When the tissues have been well soaked in the jelly, they are transferred with a portion of the jelly to small cavities scooped out in small blocks of liver which has been hardened in ordinary alcohol. . . . When the jelly is set, the blocks of liver are placed in absolute alcohol, and allowed to remain for two or three days. The jelly becomes hard and opaque, and the liver, shrinking round it, holds it firmly." The sections are then made with a razor wetted with absolute alcohol. The sections are treated with glycerine, which causes the jelly to become transparent, and "almost invisible in the preparations."

THE *Monthly Microscopical Journal* for July contains in addition to papers read before the Royal Microscopical Society, which we have already briefly noticed, one by Dr. Brooks, on the "Embryology of Salpa," read before the Boston Natural History Society; a translation of Helmholtz on the "Limits of the Optical Capacity of the Microscope," with a preface by Dr. Tripp, communicated to the Bristol Naturalists' Society; and other interesting matter. Mr. Davis's paper on "Conochilus," to which we referred last month, is illustrated by drawings showing the position of the mouth, the male of the species, the male and female eggs, resting egg, &c. The male, as figured, is a small somewhat pear-shaped body, much curved at the thickest end, with a rounded head projecting in front of a row of cilia. Mr. Davis saw one for the first time last summer. "He is scarcely larger than the head of one of his sisters," and behaves like a "preternaturally lively amoeba." Helmholtz's paper does not admit of intelligible summarising. It will be universally considered as an important contribution to the theory of the microscope, though some good authorities, Dr. Pigott among them, do not agree with his opinion that diffraction is the principal cause of the limitation of sharpness of the microscopic image, and that, "in comparison with diffraction, chromatic and spherical aberrations appear to exert but an inconsiderable influence, in spite of the very large angles of incidence and divergence of rays." Haeert's objectives having

been subjects of much discussion, a letter in the *Monthly Microscopical Journal* from Dr. Dippel will be read with interest. He admits their use for diatom resolution, but considers them quite inferior to those of Hartnack, Zeiss, and Belthle for histology. He did not find the boast of their being insensible to varying thicknesses of glass at all conformable to fact.

In reply to criticisms throwing doubt upon his statements, Mr. Worthington Smith is now able to give a complete account of the germination of the resting-spores of the potato fungus. His figures and descriptions will be found in the *Gardener's Chronicle* for July 8. He has kept the resting-spores of the two pests *peronospora infestans* and *fusisporium solani* alive in decayed potato-leaves in water, in moist air and in diluted juice of horse-dung, and shows how the fungi hide for eleven months of the year, and then germinate. He observes that "the seat of danger from both parasites is clearly in dung-heaps, ditch sides, and decaying potato-plants."

THE Fermentation of Urine is the subject of a paper by MM. Pasteur and Joubert in *Comptes Rendus*, July 3. M. Musculus, in a recent article, attributed this fermentation to the mucus of the bladder. MM. Pasteur and Joubert find that the soluble ferment noticed by M. Musculus is produced by a microscopic organism, and he states that "it is the first example of an autonomous organic ferment, the function of which is confounded with that of one of its non-organised products. It is also a new instance of a diastase produced during life and able to modify a substance by the fixation of water like other diastases."

In the same publication is an account of the examination of a slice of a meteorite by Mr. Lawrence Smith, which led to his detecting a new mineral, which he names Daubrélie after M. Daubrée. It is a brilliant black mineral of crystalline structure, found on the margins of kidney-shaped formations of troilite, sometimes passing through their centres as a thread (*filon*). It is magnetic, and gives with the blow-pipe the reaction of chromium. Nitric acid dissolves it. It is a sulphide of chromium.

M. TISSANDIER in the same number of *Comptes Rendus* gives a further account of his examination of microscopic dust in the air. He has compared the ferruginous particles with filings from various meteorites, and concludes that those he previously discovered are of meteoric origin.

M. CARLET, continuing his researches into the musical apparatus of the Cicada, states that there is a special muscle destined to produce during the song a tension of the plicated membrane, which vibrates and reinforces the sound; there is no muscle to stretch the drums, both of which vibrate synchronously.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY.—(Wednesday, July 5.)

Prof. WESTWOOD, M.A., President, in the Chair. Mr. Douglas exhibited some rare British *Psyllidae* taken by him near Lee, Kent, among which was *Aphalara renosa*, Först., new to the British fauna, now first identified as living on *Achillea millefolium*.—The President showed some microscopic slides containing specimens of *Diptera*, &c., prepared with extraordinary care by Mr. Enock. He also brought for exhibition twigs of horse-chestnut from Oxford, that had been attacked by some species of larva which had eaten away the inside of portions of the stem, causing the buds to drop off, and injuring the trees to some extent. He was in doubt whether the insect was *Zeuzera Aesculi*, or some other, but he would be glad to know if the destruction had been noticed elsewhere. He also exhibited two species of *Coccine*, one of them from his greenhouse, which he had previously described in the *Gardener's Chronicle* under the name of *C. Camelliae*, and which had afterwards been observed by Dr. Verloren in his green-

house in Holland. The female, which is one line in length, discharges a white waxy matter, having the appearance of the excrement of a young bird. The other species had been sent to him by the Rev. T. A. Preston, of Marlborough, on a species of *Euphorbia*, obtained from Dr. Hooker, of Kew. The leaves were covered with small scales, to which on close examination he observed two small filaments attached, and these proved to be the caudal extremities of the males. These insects emerge from the pupa backwards, and in consequence they make their appearance with the wings drawn forwards over the head.—Mr. Stevens exhibited varieties of some British *Geometrae*, and what appeared to be a small variety of *Lycaena Adonis*, taken near Croydon.—Mr. Baly communicated "Descriptions of a new genus, and of new species of *Halticinae*," and Mr. Peter Cameron communicated "Descriptions of new genera and species of Tenthredinidae and Siricidae, chiefly from the East Indies, in the collections of the British Museum."—Part II. of the *Transactions* for 1876 was on the table.

FINE ART.

Ernst Rietschel the Sculptor, and the Lessons of his Life: an Autobiography and Memoir. By Andreas Oppermann. Translated from the German by Mrs. G. Sturge. (London: Hodder & Stoughton, 1875.)

As the title indicates, this work consists partly of an account of his earlier years, up to about 1830, written by Rietschel himself, and partly of a narrative of the remainder of his life, closing in 1861, by Herr Oppermann, a brother of the sculptor's fourth and last wife, Dorothea Oppermann, who survived him. The former section is reproduced in the translation with scarcely any omissions; the latter has been much abridged, especially as regards its technical portions. The autobiography was written for the gratification of its author's family, without any view to publication; it is a simple, earnest record, with many intimate and curious details, well worthy of preservation. Herr Oppermann also writes sensibly and to the purpose; the curtailments, intended to bring the work more down to the level required for English reading, have probably been judiciously made.

Many artists of distinction have risen from a humble condition, and have felt the pinching of poverty; few can have done so more markedly than Rietschel. His grandfather was a master ropemaker, his father a glover and leather-breeches maker, afterwards church-clerk, upright and religious; his mother, the daughter of a schoolmaster, had been in service before her marriage, and her daughters in their turn went into service. The parents were settled at Pulsnitz in Saxony; from being poor, they became almost pauperised by the effects of the Napoleonic wars; meat was a rarity in the house, a few dollars were seldom in stock, and an expenditure of four groschen counted as an extravagance. Ernst, the future sculptor, born in 1804, showed delight from his earliest years in any prints he managed to see; in his third year he drew a man and a bear. His regular schooling hardly extended beyond reading, writing, and arithmetic; he received, however, some sort of instruction in the piano and in Latin. A painter and drawing-master named Köhler took Ernst as a gratis pupil, and the bare-foot boy assisted him in some very humble work. Soon afterwards he was bound to a snuff-dealer; but this apprenticeship he

was allowed to quit at the end of a couple of months, and was left free to follow his native bent for art, having never as yet seen even a tolerable work of painting or sculpture. At Michaelmas 1820 he went to Dresden, contemplating painting more especially as his future profession. Receiving soon afterwards an offer of an appointment at some iron-works, he took to modelling; left Dresden for Berlin in November 1826; and studied under Rauch, whose strong but essentially moderate character impressed him much. The master and pupil remained lifelong friends up to the death of Rauch in December 1857. In 1827 Rietschel received a commission for a statue of Frederick Augustus of Saxony; and he gained, by a bas-relief of Penelope departing with her bridegroom Ulysses, the prize which, but for his being a non-Prussian subject, would have entitled him to travel in Italy. After this he went with Rauch to Munich. The autobiography closes with his accompanying as far as Innsbruck this honoured preceptor and friend, then starting on an Italian tour.

Rietschel settled for a while in Munich at the time of the great pictorial activity fostered by the "Art-King" Ludwig; Schnorr, Kaulbach, Moritz von Schwind, and above all Cornelius, were leading spirits. Schwanthaler was the principal man in sculpture; but this art had as yet received little development there. Rietschel's aim was towards giving the visible expression of the inner life; his religious feeling was sincere though not gloomy, and it animated his art as well as his conduct. He visited Italy, returning to Germany in 1831 (not 1830, as in the *Memoir*, p. 114); the rest of his life was spent chiefly at Dresden, where he was Professor in the Academy of Arts, and stood at the head of the Saxon school of sculpture—and indeed, after the death of Rauch, at the head of German sculpture generally. Besides his four marriages—the first in 1832, and the last in 1851—the record of this maturer period of his life relates mostly to the works which he executed:—a colossal bust of Luther; statues of Schiller, Goethe (who was personally known to Rietschel), Gluck, and Mozart, for the Court Theatre in Dresden, burned in 1869; the pediment of the Berlin Opera-house; the Pietà which is now on the grave of Frederick William IV. at Potsdam; the Lessing Monument; the reliefs of Morning, Noon, Evening, and Night, impersonated by boys; the monument to Schiller and Goethe at Weimar; the reliefs for the Dresden Museum (by Rietschel and Hähnel); the Quadriga at Brunswick; the statue of Weber; and the great Luther Monument at Worms. He was also especially noted for medallion portraits. The Luther monument, the models for which were made ready in 1859, is Rietschel's crowning work, or at any rate would have been so had he lived to complete it; he finished the figure of Wiclif and the head of Luther, but, dying in February 1861 (of asthma, it may be inferred, though this is not explicitly stated by the biographer), he had to leave the actual execution of the great majority of the work to his pupils and successors. This monument—an object of world-wide interest to all Protestant countries—was unveiled in June 1868.

Rietschel was an upright, kindly, and most estimable man; in politics, liberal, not revolutionary. His works are not very well-known to Englishmen; who, however, may be content to surmise that the very high estimate of them set forth by Herr Oppermann is, allowing for the zeal of an affectionate panegyrist, not remote from the truth. W. M. ROSSETTI.

ART BOOKS.

The Old Derby China Factory: the Workmen and their Productions. By John Haslem. (Bell and Sons.) The special object of Mr. Haslem's book is, as he states, to give an account of the workmen employed in the Derby china manufactory, for which he has had every opportunity of collecting information, having himself been attached for thirteen years to the works. These biographies are useful to the collector as enabling him to recognise the works of the different artists, and thereby fix a certain date to specimens of their production. The history of Pegg, the Quaker, is curious. After working five years at flower-painting he gave up his employment as contrary to the teachings of Scripture, which forbids the making the likeness of anything in heaven and earth. He then worked for twelve years at the stocking trade, but, overcoming his scruples, returned to painting, which he again threw up after seven years, when he left and kept a huckster's shop till his death. Pegg's "thistle" plate is one of his well-known productions. The domestic details into which Mr. Haslem enters are of little interest, and only serve to swell the volume. A considerable number of pages are taken up with a history of the potter's art from the earliest times to majolica, Palissy, &c.—a chapter quite irrelevant. Then follows the history of the factory, in which the writer does not clearly mark out the broad distinctions between the periods of the Duesburys and Bloor: the first, full of the traditions of Chelsea, its graceful forms, its creamy paste, and the delicate flowers of Withers, Billingsley, and Pegg, the birds and landscapes of Hill and Boreman, and a host of other accomplished artists; while the Bloor period, dating from 1810, exhibits a marked change—a harder glaze is adopted, the Japan and other wares are introduced, and the landscapes of Brewer, Robertson, and Lucas, though admirable in execution, are painted in heavy, dull greens, which chip off on the hard glaze. A more tawdry style of decoration with the fine blue for which Derby was renowned, and profuse gilding, mark the later period. Mr. Haslem gives a list of the biscuit figures and of the modellers employed, also a series of specimens of the Derby plates and cups, selected, but not well chosen, from pattern books in the possession of Mr. Binns, of Worcester. A chapter upon marks and imitations completes the volume, which has been extended to an unnecessary size. Its principal novelty is the biography of the artists. As to the history of the manufactory Mr. Haslem tells us little beyond what we have already derived from Messrs. Jewitt and Chaffers, and other previous writers, and we must protest against the illiberality of his not mentioning, except by a disparaging allusion to "a pamphlet purporting to be a 'Guide to the Derby Exhibition in 1870,'" the excellent little manual published by Messrs. Benrose and Wallis, although it is evident he has made much use of its contents. Mr. Haslem is in error in surmising that the term "barbo" given to the cornflower pattern is a corruption of Bourbon, the name by which it is designated at Worcester: *barbeau* is simply the French for cornflower. Nor was it from the statue of Adonis, but that of Antinous, that Coffee modelled his celebrated Shepherd, to form the companion to Stephan's Shepherdess.

Les Ex-Libris Français depuis leur Origine

jusqu'à nos jours. Par A. Poulet-Malassis. Deuxième édition. (Paris: Rouquette.) The word *Ex-libris*, though not admitted into the French dictionaries, is by custom adopted to express any design, such as arms, monograms, mottoes or allegories placed either inside or outside a book as a mark of possession. The term is more comprehensive than our book-plate, which is restricted to armorial bearings, stamped on paper and fixed in the book. These *Ex-libris* are very curious and varied, and after having long lain unheeded are now sought with avidity. To the cultivated mind they have a twofold attraction—that of bearing the reflex of art at the period to which they belong, and of showing us the tastes of the great or the learned who have adopted them as signs of property.

Ex-libris appear to have originated in Germany, whence they were transported to France, in which country they were not known before 1600. From 1600 to 1650, the designs were strictly heraldic, composed of escutcheons and their external ornaments, crests and helmets, with lambrequins descending on both sides of the shield. Those of the time of Henry IV. and Louis XIII. are all of an artistic character. M. Malassis gives, in illustration of the period, that of the poet Malherbe, with a superb lambrequin almost enclosing the shield, and two palm branches crossed beneath.

From 1650 to 1700 many variations occur in the heraldic character of the *Ex-libris*. The lambrequin is shorn of its proportions, the helmet disappears to give place to coronets assumed, says a contemporary writer, by many who have neither the claims of birth nor property to wear them; the shield is oval, and framed in a cartouche. The custom of stamped book-plates pasted in the volume was not introduced till the next century. 1700 to 1789, the era of the three styles of the Regency, Rocaille, and Louis XVI., is amply represented by the choicest specimens of the engravers of the day. The most celebrated artists did not disdain to design book-plates, ball invitation cards, tradesmen's advertisements, and perfumers' tickets. Boucher drew the book-plate of the President Hénault. It represents Minerva, having cast away her aegis, taking for buckler the shield of the French Academy. Heraldic decoration did not suffice for the contemporaries of Voltaire and the Encyclopædia. Allegory was then the mode, and the whole staff of Olympus was called into requisition, with suns, stars, thunderbolts, and its other accessories. The shield of the Abbé de Griecourt is borne to the clouds by a swarm of cherubs. Descamps, author of the *Lives of the Dutch Masters*, has Painting seated in the sky sketching; and the father of Mirabeau has an angel crest and supporters, all enveloped in a sea of clouds. The charming *Ex-libris* of J. L. Aublé, signed by Boucher, is decorated with two of his unmistakable cherubs. Heraldry, which expired under the *bonnet-rouge*, was reascituated in the First Empire. M. Malassis closes his agreeable volume with the book-plates of some remarkable characters: e.g., that of Mme. Dubarry, with her motto "Boutez en avant" ("Push forward"), expressive of the ambition of the favourite. He touches on mottoes, such as the well-known *Ex-libris* of Grollier, paraphrased by Lambert de Villegnol into "Amicis et mihi," and exaggerated by one Savigny into "Non mihi, sed aliis." "Lege et redde" is inscribed by another on his book, and a similar injunction occurs in our own language.

M. LEGROS' ETCHINGS.

M. ALPHONSE LEGROS' etchings are, no doubt, thought as much of in England as in France, but I believe English amateurs are chiefly acquainted with those of his later years, whereas to French amateurs those that date from his residence in Paris are the best known. The following details can hardly fail to interest your readers, for nothing

that concerns so eminent an artist can be a matter of indifference.

They are drawn partly from personal recollections and notes, I having myself been very intimately connected with the knot of men who were mainly instrumental in the revival of painters' etchings—partly, also, from a critical and biographical notice called *Monsieur Alphonse Legros au Salon de 1875*, by M. A. P. Malassis, a friend of the painter's, which was published with three of the painter's etchings last year (Rouquette, Paris, and Seeley, London), in the form of a pamphlet, and referred to in the ACADEMY at the time of its publication.

M. A. Legros was born at Dijon in 1837. He came to Paris in 1849, and worked for a time at stage decoration under the clever decorator Cambon. He joined the public drawing-course, Rue de l'Ecole de Médecine, under M. Lecoq de Boisbaudran, the most remarkable of modern professors, and perhaps the only one really deserving of the name, for the pupils he has formed—Fantin, Solon, and others—and for the treatises on his method he has published. There M. Legros became acquainted with Fantin, in whose studio he began painting in oils. His progress in drawing and colour was extraordinary. I have chalk studies done by him at this period, from nature, in the studio or at home, which are masterpieces of style and truth—some studies of girls' hands more especially, drawn from the hands of his sister by lamplight in the evenings. In the drawing of his outlines, of his back and foregrounds, in his effects of light and shade, in his reflected lights, in the smallest accidents which reveal the bones and muscles and distinguish the epidermis, no artist has excelled him in *naïveté*, truth, grace and charm. He has done some large studies of heads that recall Holbein, but Holbein as he would be if he were living now. His paintings were no less extraordinary. He first announced himself by a *Portrait of a Man* at the Salon of 1857. Very few of the critics noticed it. But M. Champfleury, a writer who is very straightforward in his judgment, and who had already attached himself to the realistic doctrines of Gustav Courbet and François Bonvin, singled it out, went to see the young artist, and encouraged him to the utmost of his power. In 1859 M. Legros exhibited *L'Angelus*. Charles Baudelaire calls attention in his account of the Salon of 1859 (reprinted in 1869 by Michel Lévy, vol. ii. of his collected works) to the remarkable aptitude possessed by M. Legros for religious art. "He has proved," says M. Baudelaire, "that even in the nineteenth century the artist can produce a beautiful religious picture, provided that his imagination is apt to soar that way." M. Legros used often to visit a monastery in Paris. He studied the monks after nature, in all their household functions, cooking, digging the garden, dining in their refectories, going to prayers, &c. He knew their peculiar physiognomy by heart, their gestures, the folds of their dresses. He has often introduced them in his earlier etchings, with that intelligent recollection of the Spanish masters or the early Italians which influences all his compositions. *L'Angelus* is now in London in the possession of Mr. Seymour Haden. In 1861, *The Ex-Voto*, a religious composition, representing some old women kneeling before a Calvary in the country—now in the museum of the painter's native town of Dijon—secured him a distinct place of his own.

I do not intend following him any further in his career as a painter, but it was advisable to call to mind the part M. Legros played in the new movement then going on in France in favour of greater freedom and originality in painting, a movement tending towards naturalism. Bonvin was its originator, and Courbet its most powerful representative. But the name, realism, by which this new movement was qualified, did it the greatest injury. The public attached a wrong meaning to the word—a word it was the interest of Academicians to represent as meaning something

vulgar and ignoble, and they had the audacity to confound it with socialism—the red spectre with which the Empire threatened the Conservatives. The movement, as we see, contained, on the contrary, the most ideal elements, for it is impossible not to rank M. Legros among the idealists.

But to turn our attention exclusively to the engravings. In his second edition of *Etching and Etchers* Mr. Hamerton very justly says:—

“He has etched what are specially and justly called ‘painters’ etchings;’ that is to say, the kind of work which a painter may do by natural genius and by the help of the artistic experience gained in working with the brush.”

M. Legros’ first attempts must have been made while he was attending M. Lecocq de Boisboudran’s drawing-course, and I am inclined to think they were lithographs. Only a few proofs were struck off. They are done partly with the scratcher—that is to say, the lights and the grays are scratched with a penknife, probably on the black chalk spread on the stone. They are most characteristic. Among them are views in the neighbourhood of Paris—one of Montrouge, for instance, where the soil is white, and the wheels for raising the stone stand up high above the quarries in lofty, weird outline against the sky. There are also lamplight scenes of anatomical professors engaged in dissecting dead bodies.

Quite by chance, at Delâtre’s, the printer’s, where the young artists were then in the habit of meeting, Legros learned the nature of a plate of copper, an etching-needle, varnish, acid, &c. His first etchings are very rough; heads, full-face, of workmen in blouse or overcoat, seated at table or warming themselves at their humble fireside; one of some old women kneeling by the bedside of a dead woman. He suddenly distinguished himself among the young artists who then frequented the Louvre, Fantin, Braque, Whistler, by a strange-looking oblong plate—a procession of young and old female devotees, with tapers and missals in their hands, entering a subterranean chapel of the church of St. Médard. People were struck by the truth of the costumes, the accuracy of the poses, and more especially by the extraordinary expression of mysticism that prevails in these poor ugly faces. At the Salon of 1861, M. Legros was noticed for an etching far more skilful as regards execution than any of the above, whose leading merit is “character.” He had been travelling on the Spanish frontier with the son of M. Léon de la Borde, Director of the Imperial Archives, and had been much struck with the Spanish types he had seen in the streets and especially in the churches. The long narrow etching he sent to the Salon, which is now as much sought after by amateurs as one of Goya’s proofs, represents a number of precursors, in long black cloaks, sitting in the stalls with tapers in their hands; one stands in the middle, turning over the leaves of a large open book by the light of a double lamp of antique shape supported on a long stalk. From that time Legros was hailed as a master. The effect of the light on the faces and the bald heads, the different shades of black in the precursors’ dresses, the vigour of attack and the clever daring of the bite equalled all that other painters of any school who had tried their hand at the process had ever achieved. We shall pass briefly over his other productions of the same period; they are as it were summed up in the above. M. Legros had made the acquaintance of an editor whose name will be for ever connected with the revival of modern typography—M. A. Poulet-Malassie. He engraved several title-pages or plates of illustrations for his books. But he is most successful in large pages, as a series of scenes from the fantastic tales of Edgar Poe, proves—a series which has never been finished. Some of his conceptions are fully worthy of the writer, though Edgar Poe reaches the last degree of terror by the help of mathematical precision of detail, while Legros keeps to broad indications of outline. He has

likewise done some very delicate dry-point etchings, landscapes and portraits of friends, an experiment in the manner of Rembrandt’s *Doctor Faustus*.

Some of Legros’ earlier plates were published at A. Cadart’s in 1870, a portfolio containing thirty sheets, on laid paper. In 1869, when M. A. Legros had been already settled in London for some years, he published a draft of fifty proofs of ten different plates. These may be said to be in his second manner, which is quite distinct from the first. The drawing is more chaste, the point finer, the bite lighter and more varied. His boldness formerly was such that Gaucherel told me he had seen him one evening take a burin and a large copper-plate, attack a composition without any preparatory drawing, and finish the whole thing that same evening. The plate, the *Crab-Fishers*, is celebrated among artists.

The ten plates published by Holloway are more learned. One of the most touching in its depth of feeling represents a young monk playing the organ. The face is full of sweetness and intelligence; the hands are admirable, both as regards the action of the fingers wandering over the keys and the choice of form. The same set includes some singularly poetical landscapes. M. Legros excels in indicating a number of things by few means. He is essentially suggestive. A bush on a hillside, a footpath through a field, a tree stripped by the wind of its few last leaves, shadows creeping over a plain, are sometimes enough under his treatment to fill the mind with a strange trouble. He is an idealist in conception, and in his choice of characteristic accessories, by means of which he awakens your memory and appeals to your feelings, he is naturalistic. Therein consist his originality and his strength. I should like to see him, as Rembrandt did, often take his subjects from the life of the poor.

M. Legros has in the last few years done some large portraits, one of Carlyle among others; and a portrait of his daughter. He has also with his usual power of veracious portraiture etched some subjects that might almost be termed mystical: the *Légende du Bonhomme Mièvre*, *La Mort et le Bûcheron*, a poor old man dying in a hollow by the roadside. I do not know all his latest pieces, but those before me are so lofty in conception and so distinguished for their freedom of manner as to lead me to think that as an engraver he has reached the highest and most perfect period of his production. PH. BURTY.

ART SALES.

THERE would be little need to notice at any length the last “Wynn Ellis” sale—that of Saturday afternoon at Christie’s—were it not that the collection has been the astonishment of connoisseurs. There were 135 pictures, scarcely half-a-dozen of which, as has been remarked elsewhere, could pass for what they pretended to be. This time that part of the public which does not affect to have any knowledge was becomingly protected by the auctioneers naming the pictures in the catalogue as “in the style of” Turner and the other painters, such as William Collins, Crome, and Constable, whose names were placed on the frames. The auctioneer, also, at the opening of the auction made a statement by which his admiration of the works about to pass under the hammer was by no means implied. Most of the prices obtained were on a level with the genuineness of the pictures, though in some cases, where the imitation appears to have been clever, forty or fifty guineas were realised—a clever imitation being, in the estimation of some persons, a very desirable, since marketable, thing. Collectors are familiar with an impression after Rembrandt’s *Three Trees* which hardly ever makes its appearance at a sale without being described with eulogistic intentions as “a very deceptive copy.” In the interests of art a clumsy imitation is better than a clever one, but in the interests of

commerce a clever imitation is of course better than one which the first comer may recognise. A landscape in the style of W. Collins sold for 52*l.* 11*s.*; another for 34*l.* 13*s.* A landscape in the style of Constable, 39*l.* 18*s.*; *The Young Waltonians*, attributed to Constable, and exhibited as by him in the International Exhibition, fetched 43*l.*; and another *Young Waltonians*, called after Constable, sold for 47*l.* 5*s.*; while *The Valley of the Stour*, exhibited at the International Exhibition, brought 52*l.* 10*s.* These “Constables” were among those which were challenged as false pictures at the time of the Exhibition by a correspondent of the *Times*—a member, we believe, of the Constable family. Other pictures, attributed to Crome, Cotman, and Gainsborough, brought insignificant prices; but an imitation of Gainsborough’s well-known *Girl with a Ptecher* sold for 152*l.* 5*s.*; while *Charity*, a landscape with cottagers, sold for 110*l.* 5*s.* After several pictures “after” Muller had sold for very small prices, *The Port of Alexandria*, said to have been bought of W. Muller, brought 50*l.* Of the six pictures attributed to Sir J. Reynolds, the *Portrait of Mrs. Robinson* sold for 52*l.* 10*s.*; the others went for insignificant prices. A large picture in the style of Stanfield, *A Town on the Meuse*, sold for 33*l.* 12*s.* Next came the Turners, about some of which the catalogue did not offer any remark as being “in the style of” or “after”—such as *Shipping at Antwerp*, which sold for 65*l.* When the picture called *Caligula’s Palace*, “after Turner,” was put up, the auctioneer stated that this picture was a pendant to that called *Italy*, which was selected for exhibition at the Winter Exhibition of the Royal Academy, and which was afterwards unfortunately destroyed with many others belonging to Mr. Ellis in the Pantechnicon fire. This had, however, been kept in his house by Mr. Ellis in justification of his opinion that it and the *Italy* were fine works of Turner. This picture, very likely a clever imitation of the master, sold for 68*l.* 5*s.* A large picture of the *Miraculous Conception*, by Murillo, was said by the auctioneer to have been brought from a cathedral in Peru by Miss Gibbs about twenty years ago, and had hung on the staircase of the offices in King Street, where it was sold for 430*l.* 10*s.*, and it was afterwards restored by direction of Mr. Ellis to its present condition. The picture was somewhat altered, but there was reason to believe that it was a true work of the painter. The biddings then commenced, and the picture was knocked down to Mr. Martin Colnaghi at 430*l.* 10*s.*—the price it had sold for on the previous occasion.

At the sale of the Fitzwilliam Museum Duplicates by Messrs. Sotheby, on Monday the 10th, the works of Hans Sebald Beham were the first of importance to be disposed of. A mended but otherwise good impression of the Virgin seated with the Infant sold for 1*l.* 18*s.* (Lauser), and four prints, illustrating the Parable of the Prodigal Son, sold for 1*l.* 10*s.* (Daniell). *The Four Evangelists* sold for 2*l.* 5*s.* (Lauser). A Woman Kneeling before the Emperor Trajan, 2*l.* 17*s.* 6*d.*; a good impression of the *Judgment of Paris*, 3*l.* 17*s.* 6*d.* (Ellis and White); and five prints of the *Labours of Hercules*, 1*l.* 12*s.* (Nosedá). An impression of *Two Buffoons* sold for 3*l.* 7*s.* 6*d.* (Nosedá), one of *Two Cupids*, 2*l.* 2*s.* (Maxwell), and a good impression, with margin, of a composition of ornaments, 2*l.* 16*s.* (Thibeaudeau). Four designs for capitals of columns sold for 5*l.* 2*s.* 6*d.* (Nosedá). By Albert Dürer, a good impression of *The Crucifixion* sold for 2*l.* (Nosedá), and a good one of the *Prodigal Son*, 10*l.* 10*s.* (Ellis and White); an injured, but otherwise good impression of the *Conversion of St. Hubert* sold for 5*l.* (Savage); an impression of the *Sorcerers* for 7*l.* 15*s.* (Lauser); and an impression of the grand *Melancholia* for 17*l.* 17*s.* (Ellis and White); *The Knight and Death* went at 24*l.*; and a portrait of Albrecht, Elector of Mayence, from the celebrated Mariette collection, for 8*l.* 8*s.* (Nosedá). By Lukas van

Leyden, a good impression of a rare print, *Christ Crowned with Thorns*, fetched 24*l.* 10*s.* (Goupil). For the works of George Pencz no important prices were realised. Of the prints of Israel van Meekenen, *The Adoration of the Magi* sold for 23*l.* 10*s.*; and one of the *Death of the Virgin* for 12*l.* 15*s.* Martin Schongauer was represented by, among others, *The Nativity*, which went for 7*l.* (Lauser). The Schongauers generally were very poor. The entire sale, which consisted of 200 lots, resulted in the realisation of less than 500*l.*

THE porcelain sales of the past few days possess little interest. On the 12th Messrs. Christie, Manson and Woods sold a set of fine old Japan jars and beaker, painted with birds and flowers, for 150 *gs.* On the 14th, a Chelsea sweetmeat stand formed of shells, surmounted by a figure of Neptune, 34*l.*; a pair of white and gold Dresden candlesticks, with Cupids holding branches, 41*l.* 10*s.*; a pair of Sèvres verrières, 62 *gs.*; Dresden bust of a child, 46 *gs.*; Bacchus and four other figures round a barrel, 39 *gs.*; an Oriental jar, black ground, 8*l.*; dessert service, blue scale ground, 160 *gs.*

On the 6th, Messrs. Sotheby, Wilkinson and Hodge sold the collection, mostly Oriental, of Sir Digby Wyatt, which attained only moderate prices.

NOTES AND NEWS.

A PARAGRAPH which has gone the round of the papers, to the effect that Miss Thompson has lately turned Roman Catholic and has forsworn military for sacred art, is, we believe, anything but correct. Miss Thompson could not turn Roman Catholic, being such already; and she is now engaged upon a picture of the Battle of Inkerman.

THE opening of the Belgian International Etching Club at the Cercle Artistique, Brussels, has been postponed from the 9th inst. until September 1 next.

A TEMPORARY museum of antiquities and relics illustrative of the history of Amsterdam was opened a short time ago in that city. It is in a building on the Klovenier's Burgweil, adjoining the Museum Van der Hoop. There is a very large collection of historical portraits, some of which have high claims on the score of art. The records begin with a charter of Floru V., Count of Holland, dated 1275, freeing the merchants of Amsterdam from toll, and end with a brief of Napoleon I., dated June 13, 1811, authorising the city of Amsterdam to add to its arms a chief gules charged with three bees or. It is needless to add that when Holland ceased to be a part of the French Empire the Napoleonic bees were discarded. The whole side of one large room is occupied by the plate from the great Jewish Synagogue. It has never been exhibited before, and is of much interest. There does not seem to be anything among it earlier than the seventeenth century, but some of the candlesticks and salvers are among the most magnificent specimens of silversmiths' work in Europe.

THE Hague has also lately added to its already numerous museums what was much wanted, a museum of mediæval and later antiquities (chiefly native), after the fashion of the Hôtel Cluny. The Dutch are fond of the separatist principle in their museums, and do not seem at all inclined to build a house in the grand style which would accommodate all their treasures. When a collection overflows, they simply divide it, and hire or buy some existing house for one section, and keep the other where it was. This new "Nederlandsche Museum" was opened last year in a house on one of the great canals. It contains fine old chests and wardrobes, with well-wrought iron hinges; cases of silver, and of glasses with Wolf's engraving upon them; great "chairs of justice;" some of the better sort of Delft pottery, and a

good deal of Dutch tapestry. This last is astonishingly good, and interesting as marking a middle period between that of the "old Flemish" and that of Gobelins. One large piece represents a sea-fight, with two whole fleets seen in perspective; and an inscription in Latin verse records how the *Victor Iberus* is being defeated by the *Mattiaci* that he has invaded. The piece is full of life and spirit. But the most famous article in the collection is the huge model of the whole interior of a Dutch house, complete down to the tiny blue plates on the wall, which is said to have been made for Peter the Great, and to have cost 30,000 florins. The whole of the outside (it is some eight feet high) is of tortoiseshell, inlaid with silver. Fantastic amateurship could no farther go.

THE *Bullettino di Corrispondenza Archeologica* (June, p. 117) gives an account of the antiquities lately discovered in a tomb at Praeneste (Palestrina), the writer (M. Helbig) coming to the conclusion that the articles in question must have been produced in Phœnician or Carthaginian workshops in the first half of the sixth century B.C. Everything found in the tomb had the appearance of a very high antiquity, obviously being of the same class as the antiquities previously found by Garrucci at Praeneste, and partly engraved and described by him in the *Archæologia* of the Society of Antiquaries here (vol. xli. 1, p. 200). The British Museum obtained part of this find of Garrucci's along with the Castellani collection. Another important discovery of the same class of very early objects was that of the Regolini-Galassi tomb at Caere (Cervetri), now in the Vatican Museum. But the most interesting article in the present discovery is a silver-gilt tazza, the design on which has the same mixture of Egyptian and Assyrian styles as may be seen in the (1) tazza from Cyprus published by Longpérier (*Mus. Napoléon III.*, pl. x. xi.), and (2) the tazza from Salerno, engraved in *Monumenti dell' Inst. Arch.* (ix. pl. 44). The tazza, along with a number of silver vases of various shapes, was discovered within the enclosure of the tomb. The body, of which part of the skeleton is said to have been found, had been laid in a grave dug in the soil and lined with blocks of tufa. In the grave were numerous personal ornaments of the deceased in gold, silver, amber, and ivory.

THE Cavaliere Enrico Albino, one of the most distinguished of Italian architects, died suddenly at Rome last month. The city of Naples especially contains many fine buildings designed by him. At the time of his death he was engaged upon the façade of the cathedral at Florence, of which we have before given some particulars.

M. LÉOPOLD FLAMENG, the eminent interpreter of Rembrandt, seems to be now turning his attention towards Rubens. He is at present engaged, it is said, upon etchings of the *Coup de Lance* of the Antwerp Museum, and the *Portement de Croix* of the Brussels Gallery. These he hopes to have ready by the time of the Rubens Centenary Festival next year.

THE department of the Louvre assigned to the antiquities of Assyria, Phœnicia, Asia Minor, and the Isle of Cyprus, is at present undergoing reorganisation. A certain number of Phœnician monuments, brought to France some time ago by M. Ernest Renan, but hitherto stowed away for want of space, will now, it is stated, be exhibited.

A CATALOGUE has been prepared of the Jewish antiquities of the Louvre. This is the first that has ever been published of this small but interesting collection. It is now in the press.

A MONUMENT to the late M. Van de Weyer is to be set up at Louvain. Its inauguration is fixed for September, at which ceremony, it is stated, the King of the Belgians hopes to be present.

THE Berlin National Gallery has recently received a fine landscape by Lessing, and several

other pictures of the modern German school, as a bequest from the late Herr Wichmann, a German sculptor of considerable note some years ago, who is said to have formed many of the Berlin artists of the present time. A bust of Wichmann in white marble, by Begas, has also been added to the gallery.

MOST of the pictures that obtained prizes at the Salon this year have been bought by the French Government. Among the most noteworthy of these works are:—*La Grand'mère*, by Emile Renard; *Locuste*, by Sylvestre, who obtained the *prix de Salon* and a medal of the first class; *Mohammed II. le 29 Mai*, 1453, by Benjamin Constant; *Ouvriers de la dernière heure*, by Ronot; *Saint Jean le précurseur*, by Perrault; *Autopsie à l'Hôtel-Dieu*, by Gervex; *Le Cadavre de César*, by Rixens; *Les Anges Rebelles*, by H. E. Delacroix; *Clytemnestre*, by Toudouze; *Adam et Eve*, by Pelez; *Le Chemin de Neslette*, by Watelin; and a landscape by Herpin. In sculpture also the Minister of Fine Arts appears to have made choice of all those works which acquired the greatest distinction at the Salon. "These," says a French critic, "if not always intrinsically the best works, are at all events nearly all by artists who have made a mark, and who decidedly merit such assistance." The Municipality of Paris, on the other hand, although having a larger budget at its disposal, has been somewhat scanty in its purchases this year. We have already mentioned the four works of sculpture that were exhibited at the Ecole des Beaux-Arts; beyond these, which did not cost more than 20,000 fr. altogether, it does not appear to have made any noticeable acquisitions. The list of sculptures bought by the Administration of Fine Arts is given as follows:—*Adolescence*, by Albert-Lefeuve (the statue to which *L'Art* awarded its *prix de Florence*); *Persée et la Gorgone*, by Marquette; *Eros*, by Coutan; *Médée*, by Cordonnier; *Cet Age est sans Pitié*, by Housolle; *Un Prisonnier de Guerre*, by Chrétien; *Adonis expirant*, by Paris; *Le Masque*, by Christophe; *La Statue de Pygmalion*, by Aubé; *Mercur*, by Tournoux; *Un Charmeur*, by Ferru; *Conteur Arabe*, by Ponsin-Andary; and *Ossian*, by Allouard.

THE *Gazette des Beaux-Arts* gives this month a plentiful supply of illustrations from the Salon, but many of the wood-engravings are very poor and badly printed, several being so indistinct that it is difficult to make out their subject. Beside these, however, we have three etchings done by the artists themselves from their own works. The first of these is a powerful rendering of M. L. Bonnat's *Wrestling of Jacob with the Angel*, in which the strong opposition of light and shadow, the energy of Jacob and the serene strength of the angel, are expressed even more effectively than in the picture itself. A voluptuous beauty with long golden hair, who for this reason probably is styled the Magdalene by the artist, M. Jules Leleuvre, but who might just as well have been called Phryne or any other unrepentant damsel, forms the subject of the second etching; while the third, by M. de Nittis, is chiefly remarkable for its accurate rendering of the soles of a strong pair of high-heeled hob-nailed shoes. Two series of articles are finished in this number of the *Gazette*—namely, that of M. O. Rayet, on "Ionic Architecture in Ionia," in which he has described with great detail the Temple of Apollo at Didyma; and that of M. Charles Blanc, on the "Decoration of Vases." In this last article he lays it down as a rule that "when the form of the vase is symmetrical, as is necessary in ornamental ceramic, it is useless for the symmetry to re-appear in the decoration."

THE *Kunst-Kronik* gives an amusing account of the two winged horses, or "Pegasus," as they are called in barbarous plural, which flank the principal entrance to the Philadelphia Exhibition.

It appears that these noble animals were originally designed for the decoration of the Loggia of the new Opera House at Vienna, but when they were set up they met with so much criticism and provoked so much popular "chaff" by their very prosaic and heavy appearance, that it was determined to remove them, and they were at last sold to an enterprising Yankee for a merely nominal price, and have not been seen again until they made their appearance at Philadelphia this year.

In the *Portfolio* for this month the editor continues his life of Turner, bringing it down to the year 1800, when Turner was twenty-five years of age, and giving a short sketch of his professional position at this time. "Whenever," he says, "a publisher wanted a good drawing of an English Abbey, or Castle, or Cathedral, he knew that young Mr. Turner would do it for him in a satisfactory way, with all its landscape or street surroundings." In 1800, however, his name was already sufficiently well-known for a publisher to venture upon separate engravings from his works. Mr. Comyns Carr takes leave in this number of the Abbey Church of St. Albans, with the history of which he has so long interested us, but proceeds to give a little miscellaneous information about Sopwell Priory, St. Michael's Church, and other places in the neighbourhood. The only illustration calling for remark is a photographic reproduction of a slight little study by F. Walker—merely a peasant-boy looking at a dead bird, but drawn with that true artistic insight which makes a picture out of the simplest materials.

THE American "Palestine Exploration Society" has recently issued to its members a series of ninety-nine photographs taken from the ancient buildings and monuments of Haurân and Central Syria. Most of the examples given are of the Græco-Roman style of architecture, and are probably of the time of the earlier Roman emperors; some among them, however, such as the capitals and other ornaments in the ruined temples of Boara and Atil, have a distinctly Byzantine character, and appear to have served as types for the ornamentation of Christian churches in this style of architecture.

THE *Zeitschrift für Bildende Kunst* opens with a long article by A. Teichlein, entitled "Zur charakteristik Wilhelm von Kaulbach." Of all modern German painters "Kaulbach," says the writer, "was during his lifetime at once the most praised and the most reviled." This came from his being "essentially a man of his age," and expressing so powerfully the spirit of his age in his art. The second part of the article describes the German master's life in Rome, to which city Teichlein accompanied him as his pupil. Two of his favourite paintings in Rome were, we are told, Raphael's *Sibyls*, in the Santa Maria della Pace, and Guido Reni's *Aurora*, in the Palazzo Rospiigiosi. Michel Angelo always remained alien to him; his grandeur, strange to say, even after long study, seemed to produce an almost antipathetic effect on the German master's mind. Kaulbach and his four German pupils seem to have worked with unremitting industry in Rome, beneath the sign of a colossal bee, which the master drew over the door of his studio; but Italian art had far less influence over Kaulbach than over most Northern masters who have studied in Rome. He always preserved his individuality. "History," he was wont to say, "is the religion of our time. It is history we must paint." An excellent portrait, etched by W. Unger, illustrates the article. Six of Michel Angelo's poems, four madrigals and six sonnets, are translated into German verse by Dr. A. Woltmann. The sense is accurately given, but the German verse utterly fails to convey the music of the original. A very merry Dutch company of ladies and gentlemen, painted by Dirk Hals, and etched by W. Unger, and a charming suggestive little etching by H. Mücke, form, with the portrait of Kaulbach before mentioned, the pictorial attractions of the number.

THE STAGE.

THE week has passed without any change at any London theatre; and the dullest season of the theatrical year having been reached, one is reminded, much more than during periods when private enterprise is active, of what the playgoer loses for the want of a subsidised theatre. It may be urged that the Londoner, if he will go to the play in the Dog-days, can do without novelty and without intellectual interest. The enthusiasm that takes him there must be its own reward. It is probably a foolish way of passing his evening. But the country visitor is in different case. He is here, let us suppose, at this season only; and allowing that his absence from town has been of considerable length, there will still be very little for him to see at present. He can see *Our Boys*; but he saw it last year, and he can only go to it again on the plea of having forgotten it. He may still see a good comedy at the Court—one that has run long enough to prove success, and not long enough to weary those who like to study good actors in varied parts; and at the Gaiety, if he is very prompt, there will be Mr. Charles Mathews. Elsewhere there is much dreariness, and private enterprise appears to be hopeless. And yet the great capital of the world should not at any time in the twelvemonth present so beggarly an array not only of empty benches but of threadbare plays. A theatre subsidised by the State is a thing we are not likely to see in England until the question has been debated to weariness and prejudices are overcome. Should it ever be an accomplished fact, the frequent change of performances which would be guaranteed in summer as well as winter would be one of the most appreciated of its advantages, though not, indeed, among the most serious reasons for the existence of the institution. Meanwhile it is conceivable that private wealth and spirit should supply the deficiency. It is within the power of any English gentleman who will spend upon a theatre what is often spent on a twelvemonth's maintenance of a large country house, or what has over and over again been given to much-advertised charities of Mrs. Jelaby's order, to endow the town with worthy dramatic art from January 1 to December 31. And the time may come when that scheme of benevolence shall be held to be as reasonable as any other.

MR. MATHEWS withdraws from the Gaiety Theatre to-night, and Mr. Toole appears on Monday for a very short engagement, and seemingly in familiar pieces only. Mr. Mathews's performance of the chief part in his own comedy has even gained in smoothness since his earlier appearances in it. The performance, remarkable for no one touch, for not one feature that can suggest genius, is very remarkable for the calm suavity of its naturalness—even the improbable character is made probable by the actor's persistent and concealed art. The piece, moreover, fits Mr. Mathews better than most of those in which he has been accustomed to appear. It was a happy thought to make its hero an obviously elderly gentleman with the manners and ambitions of youth, rather than a man whom the baptismal register would prove to be young. The "awful dad" is above considerations of the baptismal register, and so is Mr. Mathews. But that the eye can any longer deceive itself from the outward aspect of the venerable comedian is a polite fiction. Mr. Mathews could not pass for a *jeune premier*, but he remains the inimitable representative of that happier vivacity which belongs to temperament and not to youth. Nor, however great may be the praises that have been given to his followers, is there the slightest sign that he will have a successor.

MME. THÉO takes leave of the public at the Strand Opéra Comique to-night.

THE Odéon company and Mme. Fargueil

finished on Saturday those representations which report says we owe to the initiative of an amateur—a nobleman—and they were due in Lyons last Wednesday, to give the first performance of *Les Danicheff* in the French provinces.

MONSIEUR COQUELIN, of the Théâtre Français, and Mlle. Delaporte came over from Paris on Monday to act *L'Autre Motif* at Albert Gate. The part played by M. Coquelin was "created" by M. Bressant at the Théâtre Français, but M. Coquelin has since taken it up and has played it a great deal in private houses in Paris.

A BENEFIT performance is being organised for Miss Amy Fawcett, and an influential committee has been formed, of which Mr. Irving, Mr. Toole, Mr. H. J. Montague, Mr. Thomas Thorne, and Mr. David James are members. It is intended to give on the morning of next Thursday, at the Vaudeville, a performance of *Two Roses*, Mr. Albery's most successful play, in which Miss Fawcett's performance was admired during some three hundred nights. Some other and slighter entertainment will also be included in the programme.

M. SARCEY has some keen remarks on the success which a "comic actor" who is not quite a "comedian" may contrive to get, but gets only in France after "ten years of labour." It is *à propos* of the performance of *Le Petit Voyage* at the Gymnase, where, on M. Saint Germain's account, it has been brought from the Vaudeville. Arnal used to play a part in it, which is now played by M. Malard; and Malard's manner, Sarcey says, "may end by being droll." Laughter is, at the theatre, as also in society, a matter of conventionality or habit. In society, when it is understood and admitted that a man is a humorous fellow, people laugh before he has quite opened his mouth, and do this partly from habit and partly for fear of being voted stupid if they didn't:—

"De même pour certains farceurs sur les scènes du second ordre. Il est admis que l'on doit rire quand ils poussent une certaine intonation ou font un certain geste, et la consigne est toujours fidèlement observée par un public docile. On ne manque jamais de rire aux endroits marqués."

But it is not everyone who can impose his method or his dodges on the crowd. A man's manner must be his own—he must "stand on his own legs"—and even in that manner there must be originality. Even then chance will count for something. M. Sarcey has seen actors at the Palais Royal who brought personal and peculiar fashions of speech and dress—fashions which made men roar at Rouen or Marseilles, but which were without effect on the Parisian playgoers. The actors had not themselves the ear of the Parisian public, and they found themselves associated with a company which had made all Paris titter any time these dozen years. They and their method had to go back to Rouen or Marseilles. They gave up the game.

WE are informed from Paris that after a run of ill-luck the Gymnase has met with what may be a fair success for a summer season. M. Castillon, a widower with five daughters, neither of whom had a dowry of more than thirty thousand francs, found no small trouble in seeing them decently settled. A would-be husband had at first presented himself, a young advocate, named M. Puygauraud. But this M. Puygauraud asked the hand of Mlle. Celia, the youngest of the five daughters, and M. Castillon had quite made up his mind that he would marry them off in proper turn. "One of two things," he had said to the lover: "either you will marry the eldest or you will wait until Celia's four sisters have preceded her to the altar." The enterprising Puygauraud accepts this second and seemingly desperate alternative, meaning to do his best very actively to get his future sisters-in-law married. He marries the eldest to a clerk, the second to a naval captain, the third to a Vicomte de Saint-

Brès—it reminds one a little of the wholesome course portrayed by Mr. Long in his picture. There remains then only the youngest girl but one—Jeanne is her name—and Puygauraud destines her for his friend the Marquis d'Escayrac. Nothing then is apparently in Puygauraud's way, except that he has forgotten to take into account some possible stupidity and envy. Each of the young women regards Puygauraud as her evil genius, because each finds her own position unequal to her deserts; and now, unhappily, Castillon himself begins to fancy that since Jeanne is to marry a marquis, Puygauraud's Celia can hardly be allowed to marry anyone who is less than a duke. But amongst the five sisters one has a heart as well as jealousy; Jeanne has fallen seriously in love with Puygauraud, who at last discovers her passion and returns it. The Marquis then may marry Celia. Puygauraud has got the right wife, and has no greater trouble now to take than that of complying with what must needs be Castillon's final demand: "*Trouvez-moi une veuve.*" Achard, Malard, and Mdle. Legault give effect to this amiable pleasantry, and the curtain falls nightly upon a piece that in its own light way is perfectly successful.

A RECENT number of *L'Art* contains, with a good likeness of Mdle. Blanche Pierson, a good-tempered but sufficiently outspoken article on that excellent artist.

MDLE. JEANNE BERNHARDT has appeared at M. Montigny's theatre in *La Niais de Saint-Flour*. She is very elegant, and her enunciation is correct, and indeed a little too visibly studied. "*Ce qui lui manque,*" says a severe critic, "*pour ce rôle de petite bourgeoise ingénue, c'est l'ingénuité bourgeoise.*"

M. DUMAS will contribute, it is said, a new piece to the Gymnase Theatre next winter.

MUSIC.

WAGNER'S "RING DES NIBELUNGEN." (First Article.)

THERE can be no doubt that the forthcoming performances of Wagner's great tetralogy at Bayreuth, which it will shortly be my duty to report for this journal, will be the most important musical event not merely of the present year, but (it is hardly too much to say) of the present generation. In speaking of its importance I am not referring to the scale of probably unexampled magnificence on which the work is to be produced, nor even to the fact that the music will be rendered by such an assemblage of the finest dramatic artists from all parts of Germany as has never on any one occasion been heard together, but to the influence which the performances are likely to exert on the future of dramatic music. An experiment of a perfectly new kind is about to be tried under the most favourable circumstances possible; and, be its success more or less complete, the results, either as establishing or disproving Wagner's art-theories, cannot fail to be of the highest importance. The *Ring of the Nibelung* is a work so novel and elaborate both in conception and treatment that it would be hopeless to attempt to convey any idea of it in one or two articles written, necessarily in haste, after the performance; besides which, much that would be said would be partially or entirely unintelligible to readers who had no previous information respecting the work. I therefore propose in a few preliminary articles to give, as briefly as is consistent with clearness, some account of this extraordinary production of Wagner's genius.

It will be needless to preface my remarks by any general dissertation on Wagner's theories. The subject was treated in these columns in detail some time since (ACADEMY, February 14, 1874), and readers may be referred to that article. Neither will it be necessary to dwell upon the well-known fact that the tetralogy is to be per-

formed at a theatre expressly erected for the purpose, further than to say that the necessity for such a special building arose from the fact that it would have been impossible to obtain the exclusive use of any existing theatre for a sufficiently long time to secure any adequate preparation of a work making very unusual demands both upon singers, players, and machinists. The theatre is not only built, but paid for; and, although the whole expense of the undertaking is estimated at 300,000 thalers (45,000*l.*), there seems every reason to expect that no pecuniary loss will be incurred.

The subject of *Der Ring des Nibelungen* is, of course, taken from the old German myth, of which I cannot speak from personal knowledge. I have, however, read carefully Mr. Thomas Carlyle's masterly account of it in his "*Miscellaneous Essays*," and I find that Wagner's drama differs in several material respects from the version of the myth there given. As Mr. Carlyle alludes in his essay to various other poems on the same subject, it is possible that some of the differences to be noticed may arise from the composer having drawn his material from other sources; it is, however, very probable that he has himself modified the plot, as he has also done with *Tristan und Isolde* to suit the requirements of his drama. Be this as it may, he has certainly produced a libretto of admirably sustained interest, and containing some most powerful situations.

The work consists of four parts, which are to be played on four consecutive evenings. These parts are intimately connected, both from a musical and a dramatic point of view. The dramatic action is continuous, each part of the work being a sequel to the preceding—much as, students of the classics will remember, is the case with the *Agamemnon*, *Choëphori* and *Eumenides* of Aeschylus. Many of the most important of the musical themes (the "*Leit-motive*") also run through the whole series; so that anyone who should hear the second or third part of the work without any knowledge of the first, in which the true significance of many of the themes is shown, would most certainly fail to appreciate, and probably also, in a great degree to enjoy, the music.

The "preliminary evening" ("*Vorabend*") of this great drama is entitled *Das Rheingold*, and may be looked upon as the exposition of the plot. Unlike the works that follow, it is not divided into acts, but consists of four scenes, which follow one another continuously. It may therefore be anticipated that the listening to this work, which will probably take from two and a-half to three hours in performance, without so much as one minute's pause, will be the severest mental exertion of the festival. Wagner is a composer who so carefully calculates every effect and elaborates every detail that it is impossible to suppose that he has connected the scenes in the way he has done without some good reason; but what the reason is is not so apparent.

In the *Rheingold* the interest is wholly superhuman, or perhaps it should rather be said extrahuman. The whole of the characters in this introductory portion of the drama are supernatural beings—gods, goddesses, giants, Nibelungen, and Rhine-daughters. It may be well before proceeding to explain, for the benefit of those not versed in old Teutonic mythology, what "*Nibelungen*" are. We give the explanation in Wagner's own words. In his article "*Der Nibelungen-Mythus, als Entwurf zu einem Drama*," he thus writes: "From the womb of night and of death sprang a race which dwells in Nibelheim (*Nebel-heim*), i.e., in subterranean dark clefts and caves; they are called '*Nibelungen*;' in continual restless activity they burrow through the entrails of the earth like worms in a dead body; they melt, refine, and forge the hard metals."

The first scene of the *Rheingold* shows us the bottom of the Rhine; we see rocks, intersected by chasms rising from the ground, while above flow the waters. The three Rhine-daughters, Wog-

linde, Wellgunde, and Flosshilde, are sporting in the waves. From a dark cleft comes forth a hairy and mis-shapen dwarf, who watches their play; it is Alberich the Nibelung. He is enraptured at the sight of the three sisters, and would fain "make love" to them. They ridicule his advances; he endeavours in vain to catch them, but they are far too nimble for him. As he stops, gasping with rage, his attention is arrested by a brilliant golden gleam from one of the rocks. He asks the sisters what it is; and they inform him that it is the Rhine-gold, and that whoever made a ring from it would possess measureless power. Flosshilde, more cautious than her sisters, warns them not to betray the secret; but they remind her who alone has power to profit by the gold:—

"Nur wer der Minne
Macht versagt,
nur wer der Liebe
Lust verjagt,
nur der erzielt sich den Zauber
zum Reif zu zwingen das Gold."

I have quoted these lines because the musical phrase accompanying them is one of the most important in the work. The Rhine-daughters feel safe from Alberich, because he is evidently violently in love with them. The dwarf, however, who has listened to their conversation, sees at once the power to be obtained by the gold; he climbs up the ridge, clutches at it, and tears it away, at the same time forswearing love, and disappears in the darkness. The maidens dive rapidly after him, but in vain. Thick darkness envelops the stage, which becomes wholly invisible in a black mist.

The mist clears away, and the scene has changed. A mountain landscape is before us, at first indistinctly seen in the early gray of dawn. The first gleams of the rising sun illumine the glittering pinnacles of a distant castle on a hill in the background, between which and the foreground is a deep valley, through which flows the Rhine. In the foreground Wotan (the god Woden or Odin) and his wife Fricka are lying asleep. The latter is the first to awake; her glance falls upon the castle, and she wakes her husband in a fright. He exhibits only joy on seeing the noble castle completed; but Fricka reminds him of the condition on which it had been built for him by two giants, to whom he had promised in payment the hand of his wife's sister, Freia. He tells Fricka to make her mind easy, as he never seriously intended to give up his sister-in-law. At this moment Freia enters hastily, and implores protection from the two giants, who are in pursuit of her. Wotan asks her if she had seen Loge, the Fire-God, who is, as he says himself, "only half a genuine god," and who probably might be more accurately described as a malicious and subtle young devil—the Mephistopheles of the drama. It was Loge who had persuaded Wotan to make the bargain with the giants, and promised to help him out of it. Now that he is wanted, however, he is nowhere to be found, and Fricka upbraids Wotan for his confidence in one who is always getting him into trouble, and then leaving him in the lurch. The two giants, Fasolt and Fafner, now appear, armed with massive clubs, and demand the performance of the contract. Wotan makes various excuses to gain time. Freia's brothers, Donner and Froh, come forward, and would use force, but Wotan prevents them, reminding them that he is bound by treaty. At this moment Loge appears. His character is most carefully developed by Wagner; but to do justice to it would require a separate article, and it would be impossible without copious quotations to give any idea of the bitter and sardonic tone of many of his speeches. His immediate connexion with the plot will appear as we proceed. Wotan reminds him of his promise to find a substitute for Freia, and says that he (Loge) knows that it was in reliance on that promise that the bargain with the giants was made. Loge replies "I promised to do my best to find a substitute; but if there is

no such thing, how could I procure it?" He proceeds to tell how he had been round the world in vain, and now finds that there is nothing on earth which men consider an equivalent for woman's beauty and worth. Only one had he seen who renounced love; and he then relates how the Rhine-daughters had complained to him of the theft of their gold by Alberich, and had asked him to pray Wotan to get it back for them. A conversation as to the virtue of the gold and of the ring follows; the giants, listening to it, come to the conclusion that the gold will be more serviceable to them than Freia, and therefore tell Wotan that they will accept it in her place. Wotan says he cannot give them what is not in his possession; whereupon they seize Freia, and carry her off: they will bring her back in the evening; meanwhile they keep her as a hostage. If on their return the gold is not given to them, they carry her off for ever. As soon as she is gone a pale mist comes over the stage; the gods appear weak and aged. Loge explains that Freia supplied them with the apples the eating of which kept them constantly young, and for want of which they must pine away. Wotan then resolves to go to Nibelheim to get the gold from Alberich, and orders Loge to accompany him.

In the third scene we are presented with the subterranean caverns of Nibelheim. Alberich drags in by the ear his brother Mime—the one comic character of the drama—over whom, as over all the Nibelungen, the magic gold had given its possessor unbounded power. Alberich is rating Mime for laziness; the latter declares that his work is finished, and at last in his fright lets fall a helmet which he had concealed in the hope of keeping it for himself. This is no other than the "Tarnhelm" (or "Tarnkappe") the "helmet of darkness," which enabled its possessor to assume any shape at will. To test its power, Alberich puts it on, and changes into a column of mist. Though Mime can no longer see him, he is soon made to feel him, for we hear the strokes of an invisible whip, under which Mime writhes. Alberich enters one of the clefts at the back of the cavern, and Mime crouches on the ground groaning and howling. Wotan and Loge appear, enter into conversation with Mime, and learn from him what is past. They soon perceive that no easy task is before them; but Loge's cunning is equal to the emergency. Alberich reappears in his natural shape, the Tarnhelm hung in his girdle, the ring on his finger: he looks suspiciously at his visitors, whom he soon recognises. Wotan says that the report of Alberich's great power has reached them, and curiosity has induced them to visit him and see for themselves. Loge cunningly allays his suspicions, and, while professing great admiration, asks what security he has against his ring being stolen. Alberich tells him that the Tarnhelm will effectually hide him. This, however, Loge declines to believe unless he sees it for himself, and Alberich, proud of his helmet, asks what shape he shall assume. "What thou wilt," says Loge; "only make me dumb with astonishment." Alberich changes into an enormous snake, and Loge pretends to be horribly frightened. When Alberich has resumed his proper form, he asks if they believe him now. Loge says he thinks it would be much more difficult to become very small. "Bah! nothing easier!" replies Alberich; "how small shall I be?" "So that this narrow crevice in the rock can hide thee," says Loge. Alberich then changes into a toad. "Seize him, quick!" cries Loge to Wotan. The latter puts his foot on the toad; Loge stoops down, and takes the Tarnhelm. Alberich in his own shape is seen writhing under Wotan's foot. The gods bind him securely and carry him off.

The last scene presents the same locality as the second. Wotan and Loge enter, bringing with them the captive Alberich. For his ransom they demand the hoard of the Nibelungen. Alberich, touching his ring with his lips, summons his kin-

men, who bring in the treasures and pile them on the ground. This, however, is not all. Wotan demands also the Tarnhelm and the ring. The former Alberich, not without reluctance, surrenders, the latter he absolutely refuses. "My life, but not the ring!" It is useless, and Wotan tears the ring by force from his finger. He is then unbound, and, in a passage equally remarkable from a poetical and musical point of view, he solemnly curses the ring. Its charm shall bring death to whoever wears it; every one shall desire it, yet none shall profit by it; care shall consume its possessor, and envy gnaw him who has it not; the master of the ring shall also be its slave, till it again returns to its original possessor. This curse is the salient point of the whole tetralogy; its working furnishes the subject-matter of the three dramas which follow. Alberich disappears, and the giants enter, bringing with them Freia. The gold is given to them; but before they will release the goddess they demand also the Tarnhelm and the ring. The former Wotan gives with little hesitation, but, like Alberich, he positively refuses the ring. Fricka, Froh, and Donner attempt to persuade him, but in vain, and the giants are about to carry Freia off, when from a cave at the side appears a blue light, in which a noble female figure is seen. It is Erda, the mother of the Norns. In solemn accents she counsels Wotan to yield, for a curse is attached to the ring, and whoever possesses it is devoted to inevitable ruin. Wotan yields; the ring is thrown on to the heap, and the giants release Freia. The curse attached to the ring begins to work immediately, for the giants quarrel over its possession, and Fafner, with his club, strikes his brother dead. He then piles the treasure and Fasolt's corpse into a great sack, and carries them off. Donner constructs a rainbow-bridge across the valley, over which the gods pass to the castle, to which Wotan gives the name of "Walhalla." As the gods cross the bridge the lamentations of the Rhine-daughters bemoaning their lost gold are heard from the waters below.

EBENEZER PROUT.

THE present season of the Royal Italian Opera came to a close last Saturday, with a performance of *L'Etoile du Nord*. Of the few promises of its prospectus the two most important have been redeemed by the production of *Tannhäuser* and *Aida*, both of which were noticed in these columns. This evening the season of Her Majesty's Opera at Drury Lane closes. On this there is nothing to say, as Mr. Mapleson designedly confined himself to well-known works, pending the completion of the new National Opera House.

M. MASSENET's opera, *Le Roi de Lahore*, is expected to be produced early next year in Paris; the principal parts are intended for Mdle. de Reszke and Messrs. Salomon and Lassalle.

It is announced that the music-publishing business of F. Schreiber in Vienna has been purchased by Cranz, the publisher of Hamburg. Schreiber was the successor of Spina, who in his turn succeeded the well-known Anton Diabelli, the original publisher of many of Beethoven's works, and himself a composer of some reputation.

A STATEMENT has appeared in some German, especially Viennese, papers to the effect that the third performance of the *Ring des Nibelungen* at Bayreuth will not take place. To this an authoritative denial is given in the *Musikalisches Wochenblatt* and the *Neue Zeitschrift für Musik*—two papers especially likely to be well informed on any matters concerning Wagner.

HERR WILHELM TREIBER, from Gratz, is engaged as conductor of the "Euterpe" musical society at Leipzig for next season. Herr Treiber is well known in Germany as a pianist, and is said also to be an excellent conductor, so that his engagement is regarded as a good acquisition.

In the first six months of the present year no fewer than twenty-eight Italian composers have

produced new operas. The complete list of their names is given in one of the German papers, the only one at all known in this country being that of Ponchielli.

VERDI's *Aida* has been translated into Russian, and it is intended to produce it next season at the Marien Theatre in St. Petersburg.

AUGUST RÜCKEL, formerly conductor at the Dresden Theatre, died on June 16 at Pesth. He was at Dresden the colleague of Wagner, and took with him an active part in the revolution of 1848. He was imprisoned in consequence, and only set free in the year 1862.

In our issue of June 3 we called attention to a plagiarism of a somewhat unusual character from our columns in the *Music Trade Review*. In the letter written by the London correspondent of that paper which appears in the number of July 3, the following explanation is given:—

"Before I proceed with my news I will have to ask you one favour—that is, to exonerate me from a plagiarism of which I am entirely innocent, and which, with full right, the ACADEMY objects to. You know that I have written neither the letter of May 18 nor June 3, and that consequently if my *remplacement* has chosen to express his admiration for the ACADEMY in a quotation without quoting the source, I do not like to take the responsibility upon myself. Now I am at my post again, and nobody shall accuse me of wearing other people's feathers in my cap."

To this the following editorial note is added:—

"That is all right; but having recommended us the *remplacement*, surely we cannot be responsible for the inconsiderate act which he received a well-deserved thrashing for."

It is no more than simple justice both to the editor and to his London correspondent to print the above explanation; and we do so with the more pleasure as we certainly had a very favourable opinion of the *Music Trade Review*, and were therefore not a little surprised to find what had taken place. We most willingly acquit its correspondent of any more grave charge than that of want of judgment in the selection of his deity.

GRATEFUL—COMFORTING.
EPPS'S COCOA.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—See article in the *Civil Service Gazette*.

Made simply with boiling water or milk.

Sold in packets (in tins for abroad) labelled—

JAMES EPPS & CO., Homœopathic Chemists,

48 THREADNEEDLE STREET, and 170 PICCADILLY.
WORKS—EUSTON ROAD and CAMDEN TOWN, LONDON.

MAKERS OF EPPS'S GLYCERINE JUJUBES FOR THROAT IRRITATION.

In consequence of Spurious Imitations of
LEA & PERRINS' SAUCE,which are calculated to deceive the Public,
LEA & PERRINS have adopted
A NEW LABEL,
bearing their Signature, thus:—*Lea & Perrins*which will be placed on every bottle of
WORCESTERSHIRE SAUCE,after this date, and without which none is genuine.
Sold Wholesale by the Proprietors, Worcester;
Crosse & Blackwell, London; and Export Oilmen generally.
Retail, by Dealers in Sauces throughout the World.
November 1874.

DINNEFORD'S FLUID MAGNESIA

For over 30 years approved as the BEST REMEDY for
Acidity of the Stomach, Heartburn, Headache,
Gout, and Indigestion;and as a safe and gentle aperient for delicate constitutions, ladies,
children, and infants.

DINNEFORD & CO.,

172 NEW BOND STREET, LONDON; and of all Chemists
throughout the world.

SATURDAY, JULY 29, 1876.

No. 221, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Pacchiarotto, and how he Worked in Dis-temper: with other Poems. By Robert Browning. (London: Smith, Elder & Co., 1876.)

WITH *The Ring and the Book* began a distinct period in Mr. Browning's career as poet. The reader will not have forgotten the symbolism involved in the name of that poem—to work into the form of a ring the virgin gold the artificer needs to mingle alloy with the metal; the ring once made, a spirit of acid drives off the alloy in fume. So in the story of the Roman murder-case the poet mingled fancy or falsehood with truth—not for falsehood's sake, but for the sake of truth. The characteristic of Mr. Browning's later poetry is that it is for ever tasking falsehood to yield up fact, for ever (to employ imagery of his own) as a swimmer beating the treacherous water with the feet in order that the head may rise higher into pure air made for the spirit's breathing. Mr. Browning's genius unites an intellect which delights in the investigation of complex problems with a spiritual and emotional nature which manifests itself in swift and simple solutions of those problems; it unites an analytic or discursive power supplied by the head with an intuitive power furnished by the heart. Now, in Mr. Browning's earlier poems his strong spiritual ardours and intuitions were the factors of his art which most clearly made their presence felt; impassioned truth often flashed upon the reader through no intervening and resisting medium. In *The Ring and the Book*, and in a far greater degree in some subsequent poems, while the supreme authority resides in the spiritual intuitions or the passions of the heart, their momentary, decisive work waits until a prolonged casuistry has accomplished its utmost; falsehood seems almost more needful to the poet than truth. And yet it is never actually so. Rather to the poet, as truth-seeker, it appeared a kind of cowardice to seek truth only where it might easily be found; the strenuous hunter will track it through all winding ways of error. The masculine characters in Mr. Browning's poems are ordinarily made the exponents of his intellectual casuistry—a Hohensteil-Schwangau, an Aristophanes—the female characters, from Pippa to Balaustion, are the revealers of truth which, with them, is either a divine grace or a dictate of pure human passion. Eminent moments of life have a supreme interest for the poet—when life, caught up out of the ways of custom and low levels of prudence, takes its guidance

and inspiration from a sudden discovery of truth through some high ardour of the heart; therefore it does not seem much to him to task his ingenuity through almost all the pages of a lengthy book in creating a tangle and embroilment of evil and good, of truth and falsehood, in order that a shining moment at last may spring forward and do its work of severing absolutely and finally right from wrong and shame from splendour. Thus Mr. Browning came more and more to throw himself into prolonged intellectual sympathy with characters towards whom his moral sense stood in ardent antagonism. His readers longed at times for the old directness of spiritual and impassioned truth. It was this longing which made some of the lovers of Mr. Browning's poetry look with peculiar desire for a volume of shorter pieces—the first since *Dramatis Personae*—in which the intellectual side of the writer's genius might be under restraint, and the spiritual instincts and ardours might not pierce and rend as in *Aristophanes' Apology* and *The Inn Album*, but play once again comparatively unencumbered as in *Rabbi Ben Ezra* and *Abt Vogler*.

The present volume is no such gift as was *Dramatis Personae*. It contains several interesting poems, and one—"Nympholeptos"—in Mr. Browning's best manner. There is, of course, throughout the whole, the presence of a vigorous personality; we can tumble and toss even in the rough verse of *Pacchiarotto* as we do in a choppy sea on which the sun is a-shine, and which invigorates while it—not always agreeably—bobs our head, and dashes down our throat. But of the highest qualities of Mr. Browning's genius obtaining adequate expression—such as they obtained in *Men and Women*, and in *Dramatis Personae*—there is less than we had looked for in this volume of miscellaneous pieces. Its speciality, as compared with preceding volumes, is that it contains not a little running comment by Mr. Browning upon himself and his own work, together with a jocular-savage reply to his unfriendly critics. In the *Epilogue* the poet informs us that those who expect from him, or from any poet, strong wine of verse which is also sweet demand the impossible. Sweet the strong wine shall be; but not until it has lain mellowing till the century's close:—

"Mighty and mellow are never mixed,
Though mighty and mellow be born at once.
Sweet for the future—strong for the nonce."

The experience of Mr. Browning's readers contradicts this statement. Some who drank the good wine of 1855 and that of 1864 in the years of the vintages found that they were strong and needed no keeping to be sweet. Wine-tasters must make distinctions, and one of them who expected to find 1876 an extraordinary year must in his report describe the quality of its yield as "average."

The poem from which the volume is named tells in verse (correctly described by the writer as "timed by raps of the knuckle," verse almost Skeltonical) how *Pacchiarotto*, painter and world-reformer, first painted on the walls of his grotto Pope, emperor, nobles, ladies, soldiers, beggars, and, having tried his reforming ardour and oratory on these mutes, proceeded to put

the same in practice, during famine-time, upon the live human folk of Siena. The reformer is hunted through street and alley, until he runs to earth from his pursuers in a vault already tenanted by a corpse. Next day *Pacchiarotto* comes forth a sadder and a wiser—though a more unsavoury and verminous—man, having learnt his lesson, to hold on by the paint-brush and maul-stick and do his own work, accepting the mingled evil and good of life, in a spirit of strenuous—not indolent—*laissez-faire*, playing, as energetically as a human being can, his own part, and leaving others to play theirs—assured that for all and each this life is the trial-time and test of eternity, the rehearsal for the performance in a future world, and

"Things rarely go smooth at Rehearsal."

The same spirit of strenuous *laissez-faire* finds expression in one of two short poems named "Pisgah-sights." Mr. Browning's interest in social and political problems is essentially subordinate to his interest in those which concern the individual soul; a perfected human society, with no prospect of future existence for the individual, would seem to Mr. Browning a paddock in which only "ghastly smooth life, dead at heart" were possible. Contemporary social and political movements, though our time has been so deeply roused and shaken by these, have passed by unnoted in the poetry of Mr. Browning. But into spiritual questions which touch the individual life it has entered with courageous vigour.

The poem or joke "*Pacchiarotto*" cannot end without a word for Mr. Browning's unfriendly critics. Its tone—the cheerful-jocular-insulting—may be a novelty, but in substance it lacks originality. "You critics who don't admire me are very small, contemptible, malignant creatures; for one of you, who wrote *Poetry of the Period* and whose name rhymes with 'Sauced in,' I have invented two nick-names. Decamp, or my maid will throw slops at you." We had a feeling that Mr. Browning was the Herakles of our living English poets:—

"He did too many grandnesses, to note
Much in the meaner things about his path:
And stepping there, with face towards the sun,
Stopped seldom to pluck weeds, or ask their names."

And so, after all—the pity of it—our Herakles has something in him of the *genus irritabile*!

"At the *Mermaid*" taxes our faith; we find it difficult to place in Shakspeare's mouth this disclaimer of the ambition of heading a poetical faction, this condemnation of Byron and the poetry of *Weltschmerz*, and this resolutely cheerful acceptance of life. The imaginary Shakspeare bewilders us by his strange likeness to a poet of our own day, and finally the features settle down into those of a Shakspeare-Browning. Long ago Mr. Browning explained in *Sordello* that only in such songs as those of Eglamor—to whom verse was "a temple-worship vague and vast"—do you find completeness, the song and the singer being one; while from "true works"

"Escapes there still
Some proof the singer's proper life was 'neath
The life his song exhibits, this a sheath
To that."

Mr. Browning reasserts this and applies it to himself in the present volume. To us he gives his work; but his life is his own. He will not shear the cowslips from his field to sweeten for us the strong wine he makes; the cowslips are his own; he will not unlock his heart in sonnets. This is the thought of the poem "House;" a peep through the window is permitted (and, indeed, the poet comes several times to the window to say that he is not to be seen), but, "please you, no foot over threshold of mine." The same train of ideas runs on in the poem "Shop." Verse-making is the poet's trade as jewel-selling is the jeweller's; but do you suppose that the poet lives no life of his own—you know not where or how—far from his counter and his till?

"Bifurcation" is highly characteristic of the writer; two epitaphs are dictated, one of the woman who chose duty rather than passion, the other of the man who chose passion rather than duty, and who strayed and stumbled. Ardour and enthusiasm have always appeared to Mr. Browning as more needful to man's highest life than obedience to law; and therefore he cannot call the impeccable person a saint, nor the man who has come to the end of this term of life stained and bruised, a sinner. "Fears and Scruples," again, reminds the reader of many earlier poems—it is a confession of the trials of theistic faith in a world from which God seems to be an absentee. What we thought were letters of our friend are proved forgeries; what we called his loving actions are the accumulated results of heredity. Yet, even if theism were abandoned it would have borne its fruit:—

"All my days I'll go the softlier, sadlier
For that dream's sake! How forget the thrill
Through and through me as I thought 'The
gladlier
Lives my friend because I love him still'?"

The story of how the gallant Breton sailor, Hervé Riel, saved the French fleet, and chose for his reward a holiday to see his wife, the Belle Aurore, is already known to readers of the *Cornhill Magazine*. A grim-grotesque incident from the history of the Jews in Italy is related at length in the poem "On the Privilege of Burial." "A Forgiveness" is a blank verse monologue, uttered in the confessional by a husband who has sealed his pardon of a wife (faithless because she had doubted his love) by doing her to death; the priest who listens is the wronger of the dead woman, and the poem closes with the sudden transformation of the seeming penitent into an armed avenger. An interesting note on Shelley's *Cenci*, explaining why the Pope, who was inclining to pardon Beatrice, of a sudden resolved upon her condemnation, is given in "Cenciaja." It might, with no loss of effect, have been given in prose.

The only poem in the volume which takes rank with Mr. Browning's best poems of 1855 and 1864 is "Nympholeptos." The nympholept stands before his white ideal craving love; and it seems as if she will grant him only pity and pardon. He departs from the white light of her presence, into the refracted rays of our low earth—departs to obey her bidding, to pursue the

yellow ray or the ray of crimson wherever it may be found, if such has been her will.

"Forth at your behest
I fare. Who knows but this—the crimson-quest—
May deepen to a sunrise, nor decay
To that cold, sad, sweet smile?—which I obey."

One dare not intrude into the sanctities of what the poet reserves from his readers; but in a volume where much is personal it is hard to restrain oneself from finding a pathetic personal significance in this poem; it is not easy to turn away our imagination in thinking of the nympholept's ideal from one who was the

"Lyric love, half angel and half bird,
And all a wonder and a wild desire."

This review of Mr. Browning's new volume amounts to saying that all his work is not his best work. Happily for one reader Mr. Browning's poetry has too strong a hold on his love and gratitude to permit them to escape, even when escape seems least difficult.

EDWARD DOWDEN.

The Journey of Augustus Raymond Margary, from Shanghai to Bhamo, and back to Manwyne. (London: Macmillan & Co., 1876.)

THIS volume has a twofold claim on our attention: it is interesting, first, as a portrait of one whose early career, untimely closed, bore promise of much distinction; and, secondly, as an account of the valuable service he had already performed, and in the completion of which he lost his life. The work consists mainly of Mr. Margary's letters and journal describing his residence in China in the Consular Service, and his now famous journey across that country; with a supplementary chapter by Sir Rutherford Alcock on the policy which led to the journey.

The portrait unconsciously drawn in his journal and letters is a very attractive one. Brave and unselfish, with a fund of good temper and tact, he is at times overflowing with boyish high spirits, all the while naïvely lamenting his consequent distaste for the ascetic side of religion. He was appointed at the age of twenty-one to a student-interpretship in China, where we find him combining a good deal of social enjoyment with that careful study, not only of the language, but of the manners and character of the people, to which his after success was so largely due. A competent knowledge of so vast and difficult a subject could only be attained after years of study; it was therefore no small tribute to Mr. Margary's attainments and character that he should have been selected for the delicate task of traversing China to the Burmese frontier, to meet and escort the mission sent by the British Government to penetrate China from that side. Although suffering severely from illness, Mr. Margary's spirits rose at the prospect of so important a mission, and he modestly expresses a confidence in his own powers which was fully justified by the result. The qualities requisite for successful travelling in China are in many respects of a higher kind than those needed by the traveller among barbarous tribes. A people with an ancient and complex civilisation of their own, and ignorant of, and ignoring,

any other, has necessarily but one standard of manners. To create a good impression, therefore, or even to avoid offence, the traveller must be acquainted with an elaborate code of etiquette, as well as with the niceties of a language, and with the habits of thought and feeling of a people, utterly dissimilar from his own. As we follow Mr. Margary on his journey, we feel that nothing short of his great familiarity with these could have carried him through the various difficulties that beset him; and this, combined with his rare opportunities for observation, gives a peculiar value and interest to his remarks on the people. They seem—as, indeed, they pique themselves on being *par excellence*—a very reasonable people: at all events, when their self-interest or vanity is appealed to. On more than one occasion, when surrounded and hustled by an excited mob, the traveller dispersed them, abashed, by an appeal to the far-famed courtesy and civility ("Li") of China. When we reflect on the probable result of such an appeal by a Chinaman to an English crowd, we must admit that their application of the term "barbarian" may have some justification.

The question whether or not they are a cowardly people is, Mr. Margary says, a difficult one. Their soldiers have sometimes fought bravely against us, and they submit to a surgical operation with extraordinary firmness:—

"and yet one or two Europeans may thrash a whole crowd, and their sailors are useless in a storm. The real clue to a Chinaman's action is his settled principle of non-intervention. To move in any matter, there must be some strong circumstance affecting him personally to urge him. He will stand by and stare at a Chinaman killing a foreigner with exactly the same indifference as at a foreigner beating a Chinaman."

Elsewhere he says:—

"It is the nature of Chinamen to give in to anything which asserts its superiority. A kick and a few words in his own tongue telling him he is an ignorant boor will make a common Chinaman worship you. Singly or in small groups they are the pink of civility, but a mob is rather dangerous."

For hundreds of miles Mr. Margary passed through districts where Europeans are unknown, and the curiosity with which the people pressed to see him was natural and excusable. But when the inconvenience became too great, a remonstrance, or at the worst an appeal to the local mandarin, was generally sufficient.

He was, of course, furnished with passports from Peking, and his reception by the local authorities along his route was in the great majority of cases satisfactory. Like the common people, they were surprised, as well as flattered, by his familiarity with their language and their customs, and this, combined with the tact and good humour of the traveller, often turned the scale, and produced civility and friendly feeling when nothing else would have done so. Many of them went considerably out of their way to show hospitable attention; occasionally his offered visit was declined from excess of deference, the theory in such a case being that the honour of a visit was too great. In like manner it is considered polite in conversation to show an interest in the person addressed by asking a variety of

personal questions which elsewhere would be considered indiscreet. On the whole, though he would not trust them over-much, his opinion of the people is distinctly favourable. Again and again he describes them as "charming" when properly dealt with, though he prefers the country people very much to the population of the towns.

Mr. Margary's observations do not bear out the usual belief in the excessive population of the country. Apart from the districts which have been wasted by the Mohammedan, the Tae-ping and other rebellions, he passed through great tracts of cultivable land lying barren, and many a hill-side available for pasture with but few traces of cattle. Within the walls of the cities, too, there are, he tells us, waste spaces equal to the area occupied.

The physical obstacles and privations of the journey do not seem to have been very great. There is often a scarcity of food, and the inns are horribly dirty. On the other hand, their bills are not excessive, the usual charge for a night's lodging being about 4d.

The first part of the journey was performed by water, the great Yangtse-kiang being now navigated for some 700 miles by large American steamers. From Hankow a small boat conveyed the traveller some hundreds of miles to Ch'en-Yuan fu, whence he proceeded by chair, the discomfort and even danger on some of the precipitous mountain roads being considerable. Although unable to take observations along the route, his vigorous descriptions of the general appearance and of the resources of the country are full of interest. Ascending the River Yuan, through the province of Hunan, he describes the scenery as splendid; the river winds through marvellous gorges, with hundreds of rapids, and the hills are clothed with profuse vegetation, while the peaks beyond them are covered with pine forests, the timber being floated down in rafts. Coal mines were also observed, the coal cropping out on the surface, but very inefficiently and ignorantly worked. There is great jealousy everywhere of the geologist and his hammer. The botanist, on the contrary, gathering plants, is set down as a physician, and is respected accordingly.

Further west, towards the province of Kwei-Chow, the country is fertile and beautiful, but wholly deserted. It was overrun a few years ago by the savage mountain tribes called Miaotze. These had for centuries been oppressed by their "celestial" superiors, and at last seized the occasion of the Tae-ping and Mohammedan disturbances to wreak their vengeance, which seems to have been very complete. But they were at last put down by the Imperial troops, and the country is slowly recovering. The lofty wooded hills and valleys are now rich and grand, population and cultivation increasing westwards as the famous province of Yunnan is approached. From this varied and productive region, the Caravan of Marco Polo, descend most of the great rivers of South-Eastern Asia, and its possessors are said to have always thus exercised a certain control over the countries watered by these streams. The province is still suffering from the effects of the Mohammedan rebellion, which lasted for eighteen years,

and was at last suppressed with terrible slaughter. Mr. Margary's difficulties began to thicken here, and he seems now first to have doubted whether he was to be allowed to succeed in his mission. The jealousy felt by the provincial authorities was natural, for Major Sladen, seven years before, when attempting to enter the country, had treated with the Mohammedan ruler as an established and friendly power. However, all difficulties were apparently overcome, and with a fair show of friendship Mr. Margary was forwarded on his way through the hill country which separates China from Burmah. This is peopled by the Shan tribes, a half-civilised race, the remains of a great kingdom which, as late as the fourteenth century, occupied the country as far south as lat. 16°. But these hills are also partly occupied by a wild and sturdy race of immigrants from the North, called Kakhyens, without whose good-will it is impossible to pass through the country. Mr. Margary, however, succeeded in joining the party under Colonel Browne in Burmah, who "gave me a hearty welcome, with congratulations on my splendid journey." After some delay a start was effected, but it soon became evident that there were difficulties ahead. Mr. Margary, confiding in the friendly intentions of those who had received him so well a few weeks before, went on in advance of the party, and reached the Chinese town of Manwyne, where he was murdered. The Mission was attacked by a considerable force, and had to fight its way back into Burmah, the Burmese escort fortunately remaining staunch. An account of their journey by Dr. Anderson, a competent and experienced observer, was lately reviewed in these columns. It can hardly be said that the information obtained was worth the cost—misunderstanding and loss of prestige—at which it was acquired.

The question remains, By whom were the murder and the attack on the Mission instigated? It is not likely that the opening of a trade route, with treaty stipulations and the abolition of monopolies, would find favour either with the Chinese authorities or with the King of Burmah. Suspicion at first fell on the latter, but the conduct of the Burmese escort seems to negative this view. The Chinese would hardly have acted as they did without some high sanction. The chief official in those parts was a certain Li-sieh-tai, a former leader of irregulars, whose services against the Mohammedans had been rewarded by a high command, and who received Mr. Margary with an exaggerated deference which excited suspicion. It is to be hoped that the matter may be cleared up by the report, not yet published, of Mr. Grosvenor's enquiries. Meanwhile the remarks of Sir R. Alcock on the subject deserve the attention due to the position and character of the writer. He speaks, naturally, with caution, but we gather that he considered the Mission ill-timed, and that the Chinese, already prejudiced by recollections of Major Sladen's doings, were not fully informed of our views and intentions, and had accordingly ground for complaint. But this, of course, does not justify violence and murder, and redress must, Sir Rutherford Alcock says, be exacted in some form

or other. In common with the Calcutta authorities, he is not sanguine as to the commercial value of a trade route through China, but suggests that this would be the most appropriate form in which redress could be taken. Like all who were brought into contact with Mr. Margary, he speaks in high terms of his character and attainments. *Multis ille bonis flebilis occidit.* We shall be fortunate if those to whom our future intercourse with the people of China is entrusted are equally well qualified for their difficult task.

COUTTS TROTTER.

An Alphabetical Dictionary of Coats of Arms belonging to Families in Great Britain and Ireland. By John W. Papworth, F.R.I.B.A., and Alfred W. Morant, F.S.A., F.G.S. (London: Issued to Subscribers only.)

THIS important work, commenced as long ago as the year 1858, has at length been brought to a conclusion, and forms one of the most valuable additions made to heraldic literature during the present century. Unhappily, it forms also the last monument of its author's zeal and industry, for Mr. John Woody Papworth neither lived to see the completion of his design, nor to receive even a tardy recognition of its merits. The plan which he adopted for its publication, so far from affording him any remuneration for his vast labour, actually entailed upon him considerable loss, and it must be a further subject for regret that it had the effect of restricting the issue of copies within what must prove to be far too narrow limits.

The object of Mr. Papworth's work is—as stated in the introduction—"to enable the generality of persons, though but slightly acquainted with heraldry, to ascertain with facility the names of families by whom any given coats of arms are, or have been, borne." The plan is thus the very reverse of that pursued by Sir Bernard Burke in his well-known *Encyclopædia of Heraldry*. In the latter the names of families are given in alphabetical order, followed by the arms borne by each; in the former the coats are first blazoned, and then assigned to their several owners. Thus each work is in effect almost an index to the other.

The general principle of the plan adopted by Mr. Papworth is thus explained by himself:—

"The arms are blazoned (i.e., technically described), and are arranged in alphabetical order by the names of such of the respective charges as are first mentioned in the blazon; so that the inquirer has but to blazon the coat, and the first charge that he names shows under what title in this dictionary the coat is to be sought. When there is no charge the tincture of the field is to be considered as the charge, and such coat will be found under the head of that metal, colour, or fur," &c.

Perhaps the method employed will be better explained by means of an example. We meet, for instance, with a coat which is blazoned in the following terms:—"Argent, three saltires sable, on a chief gules a lion passant or." Here, the first charge being saltires, we look for the coat under that head, and on account of its complicated

character, find it among the very last of its subdivisions. Had it been simply "argent, a saltire azure," we should have sought for and found it in the first division of the subject.

A very little practice will be sufficient to render the student familiar with Mr. Papworth's system, which seems to us extremely ingenious. Of course it is not absolutely faultless, and occasionally we meet with cross-divisions that are puzzling; but on the whole it works well, and is far more simple than upon a superficial view it would appear to be.

The utility of such a dictionary is obvious. Who is there that in the course of his rambles is not constantly meeting with some sepulchral monument or fragment of emblazoned glass, whereon can still be detected the traces of armorial bearings? If these can be identified, he is at once supplied with a clue to the past history of the relic, which thus becomes invested with additional interest, and may possibly supply a missing link in the genealogy of a family.

We are grateful to Mr. Morant for having taken up and brought to so happy a conclusion the laborious work which Mr. Papworth had begun, and we can only express our hope that the remarks we have made may be the means of drawing attention to its many merits and sterling value.

CHARLES J. ROBINSON.

DR. WHEWELL'S WRITINGS AND LETTERS.

William Whewell, D.D., Master of Trinity College, Cambridge. An Account of his Writings, with Selections from his Correspondence. By I. Todhunter, M.A., F.R.S., &c. In Two Volumes. (London: Macmillan & Co., 1876.)

NEITHER Dr. Whewell's shade nor the living Mr. Todhunter is to be felicitated on the division of labour which has allotted the examination of these literary and scientific remains to the latter gentleman, while the preparation of the biography is reserved for Mrs. Stair Douglas and Mr. Aldis Wright. It is impossible that the one task should not trench on the other, and Mr. Todhunter's candour prepares his readers for a discovery in a very early part of his preface that anything short of the whole responsibility of a comprehensive biography, for which books, letters, manuscripts, memoranda should be freely laid under contribution, must needs be a mistake. Set face to face with the promiscuous heap of the late Master of Trinity's papers, left to his own judgment in selecting from a very capriciously preserved correspondence, but still cramped by the reservation that many of Dr. Whewell's correspondents' letters were under an embargo for the biographies proper of the writers or the receiver, Mr. Todhunter has undertaken a somewhat thankless office, and, while impressing us with the patient industry of his research and criticism, failed to produce a book that can ever be more than an annotated catalogue of the voluminous writings of one as to whom Sidney Smith said, with a truth only simulating satire, that "Science was his forte, and omniscience his foible." The very thoroughness

of Mr. Todhunter's editing, the conscience he makes of leaving no work, paper, or pamphlet, in those heaps which he has reduced to system, unchronicled or uncavassed, is in itself a detriment to the readability of these volumes, which to be grasped effectually would task the midnight oil of the most dogged student, and after all leave him not a little perplexed as to the advantage of such a universalism of studies as is embraced in them. Dr. Whewell's was doubtless a most remarkable career and genius. Born in 1794, and owing his education to the Grammar Schools of Lancaster and Heversham, to which latter he was transferred through the lure of its exhibitions to Trinity, he made his way, in due course, to that great foundation, and as one of its most successful alumni from first to last might have been said not only to have "stript the tree of knowledge," but had a taste of most of its substantial fruits. Just missing the senior wranglership in Jacob's year, he soon found himself a fellow and lecturer of his college, professor of mineralogy in 1828, of moral theology and casuistical divinity in 1838, and after running the round of University offices, and receiving endless compliments and honours from without—such as a seat on the Council of the Royal Society, the Presidency of the Geological Society and of the British Association (which he had had no small part in founding)—he reached what might well be the acme of the ambition of a man of science or letters, the Mastership of Trinity, in 1841. When he received the spontaneous offer of this dignity from Sir Robert Peel as First Minister of the Crown, he was on his wedding tour, and so kindly and congenially did he throw himself into the work of his new office that, being made Vice-Chancellor of the University in 1842, he ever afterwards appears a central figure and a pillar of the University, both as to its discipline and studies, until his career was terminated through a fall from his horse in 1866. Assiduous and untiring in research in the ascent of his fame, it must be owned that even after he had rounded the hill there was no champion to whom the University so steadily or naturally looked to maintain her rights, and sustain her credit, whether in council or in controversy; and although universality of studies and acquirements involves of necessity some alloy of deduction along with the wonder it attracts, we must say that the great names which go bail for Dr. Whewell's thoroughness are sufficient to countervail any suspicion of superficiality. "Ex uno disce omnes." The candid and independent witness of Sir Charles Lyell, in vol. i. p. 112, is deserving of full confidence:—

"There was a time," he wrote in 1840, "when I used to regret that you had not concentrated your powers on some one department of physical science, and become a giant in that, or at least that, you had been satisfied with some two or three of the arts and sciences; but I have for some years come round to the belief that you have been exercising the calling for which Nature intended you, and for which she gave you strength and genius; and that you have given a greater impulse to the advancement of science among us by being a universalist, and by mastering so much of chemistry, mineralogy, astronomy, geology, and

other branches, than you would have done if restricted to the perfecting of any one alone."

In connexion with this testimony, readers would do well to turn to the first of two letters written by Whewell to the Rev. W. Vernon Harcourt, of York, in 1831, with reference to the organisation of the British Association for the Advancement of Science, then in embryo. Few other men, if any, in Great Britain, could have handled the vast subject so clearly, so minutely, or so comprehensively (see vol. ii. pp. 126-130).

His first piece of authorship dates as far back as 1819, and was a volume on mechanics, an elementary treatise, of which it might suffice to say that it ran through seven editions; but with the advantage of Mr. Todhunter's critical running commentary we are reminded of a minor fault of style in the author's habit of frequently saying "I have said elsewhere," without giving a reference; and a graver fault, seeing that his subject-matter was scientific—viz., unnecessary change of language where there was the same sense. The work on mechanics, now for many years *passé*, is described as sound in its distinctions and principles, but not well arranged or inviting or elegant in form. Worst of all, it was continually undergoing alteration, and this we are told was the rule rather than the exception with Dr. Whewell's works. It was notably the case with his well-known *Philosophy of the Inductive Sciences*, first published in 1840 in two octavo volumes. A second edition appeared in 1847, with an addition of 200 pages. And in 1858 he separated the work into three, in small octavo, the *History of Scientific Ideas*, two volumes, the *Novum Organum Renovatum*, and the *Philosophy of Discovery*, the last containing large additions. These were made to range with his third edition of the already published *History of the Inductive Sciences*; but in all these changes he did not enhance the value of what is truly designated "a noble design executed with rare ability" by the addition of an index. The signal exception to this mutability of treatment was his able Bridgewater Treatise (the first of a great series) on *Astronomy and General Physics considered with reference to Natural Theology*, which was first published in 1833, and was the most popular of all these treatises. This volume first made him famous, and, passing through six successive editions up to 1864, is one of the rare examples of permanent form among his writings. It would be simply vain to attempt to enumerate in an article the endless papers and tracts which Whewell contributed to scientific and literary reviews—a heap made all the more immense by the fact that if he chanced upon criticism of his own writings he invariably "up and answered it" in one print or another. In one year we read of his reviewing Herschel, Jones of Haileybury, and Lyell; and it is amusing in another year to find him disappointed in a scheme that seemed within an ace of accomplishment—of "introducing to the public through the same number of the *Quarterly Review* his friend Jones's *Essay on the Distribution of Wealth* and Herschel's *Discourse on Natural Philosophy*." But the bold project of two articles in a single number was more than Whewell was able to compass.

The "political economy" paper had to be transferred to the *British Critic*. Among some of the feats in reviewing which Whewell achieved, one, if we read Mr. Todhunter's account aright, was a review of himself (see vol. i. p. 75), and in an article of the *Quarterly* on Mrs. Somerville's *Connection of the Physical Sciences*, he quotes as "from the mint of Cambridge" a specimen of versification that is undoubtedly his own. Of course, the former literary feat is not unparalleled, while the MS. of Sir Walter Scott's critique upon one of his own novels still exists as a literary curiosity. While there is scarce any literature of his day in which Whewell had not a hand, it is something to know with authority from these volumes that he did not contribute to the brothers Hare's *Guesses at Truth*; though he wrote more than a hundred letters to Julius Charles Hare, and was drawn to him, among other affinities, by a keen interest in philological researches. As regards Dr. Whewell's more substantial works, we find that Mr. Todhunter prefers to the *History of the Inductive Sciences* his later work on their *Philosophy*, recording, however, the conviction that in this opinion he knows himself to be in a minority. Sir Henry Holland took a practical view, when he suggested that both works might better have been welded into one. On the *History*, however—as evincing the extraordinary union of vast and wide learning with great ability—will probably rest the fame of Dr. Whewell in chief, though doubtless his *Essay on the Plurality of Worlds* represents his best title to cleverness and skilful pleading. That essay was published in 1853, and vindicates its author's reputation and ability by the amount of notice it attracted in *utramque partem* from reviewers. Sir John Herschel as well as Sir Henry Holland doubted Dr. Whewell's deliberate belief in his own arguments against plurality. The present editor advances proofs that such doubts were unfounded. A curious fragment *à propos* of this controversy has been unearthed by Mr. Todhunter from the unpublished papers, and given in analysis in Chapter XX. of the first volume. It represents in the form of fiction the narrator's successes in endeavours to communicate with the sun, moon, and planets, and is even in its abridged form more readable than the publications of a like character which have since acquired popularity.

Time and space forbid even a glance at Whewell's work as a preacher, a teacher of Morals, or a champion of the system and advantages of his university. It would, to our thinking, be unprofitably wasted on his lucubrations or crotchets about English hexameters and elegiacs, as to which there is some evidence in the first volume that he came in for a good share of ridicule. His printed poetical remains are not striking. What might be said of Sir John Herschel's translating the *Iliad* into hexameters is true of Whewell's kindred exertations, that it was flat robbery of Science. But perhaps both deserve acquittal on the plea of "neque semper arcum," &c. Mr. Todhunter seems to imply that after his full prime he relaxed his zeal of research, and did not cultivate

familiarly the younger generation of men of science. Success, advancing years, domestic happiness, tend this way. But that he was to the last omnivorous with regard to general as well as scientific literature may be seen from his correspondence in vol. ii. His letters, always interesting and instructive, are often lively and smart; they give a pleasant idea of what he was to his friends, though the world without regarded him as overbearing and disputations. To his friend Jones he was consistently staunch and appreciative. Two letters to Sir Cornwall Lewis on the receipt of the *Hey-diddle-diddle Inscription* and the *History of Astronomy among the Ancients* (see pp. 424-5, vol. ii.) are worth notice as models of acknowledgment of such literary courtesies, particularly when it is doubtful whether that stage of perusal will ever arrive at which you will be able to pronounce critically on a book.

We are sorry that Mr. Todhunter's obvious pains and labour have been expended upon a work where his wings are clipped.

JAMES DAVIES.

Acts of the Collegiate Church of SS. Peter and Wilfrid, Ripon, A.D. 1452 to A.D. 1506.
Edited by the Rev. J. T. Fowler. (Surtees Society.)

THE Surtees Society has broken new ground. As far as we are aware, this is the first act-book of a mediæval ecclesiastical court that has been printed. A useful service to historical literature has been done, and a still greater one will be accomplished if this should, as we may hope, be the forerunner of others of the same class. Interesting as the volume before us must be to every one who has a sincere desire to enter into the life of our forefathers before the Reformation, there can be little doubt but that if our ecclesiastical records were properly examined, many far more important documents of the same class would be brought to light.

The manuscript which Mr. Fowler has edited has suffered much. It is not, we gather from his preface, the remains of one volume, but parts of several, which have been bound up together. Being thus fragmentary, we sometimes lose the thread of a case. On the whole, however, such information as is given is commonly perfect, or exists with such a measure of completeness as to furnish the reader with means for ascertaining the nature of those portions that are missing.

The ecclesiastical and civil jurisdiction of the bishops and various capitular bodies during the Middle Ages is a dark subject. Not many Englishmen in these days are learned in the Canon Law, and to the most accomplished canonist there are many things connected with the working of the English spiritual jurisdictions which would need an interpreter. As each of the manor courts, though constituted on the same general plan, had its own local customs and methods of procedure, which had the force of law within the limits of its jurisdiction, so it would seem that the ecclesiastical courts of Britain had as they grew to maturity gathered to themselves peculiar rights and practices which became part and

parcel of the law within the boundaries in which they acted. Acknowledgments of tenure, invasions of the liberty of Ripon, and adulteration of goods, were not ecclesiastical offences, but the chapter was the local authority, and it became incumbent on it as a legal tribunal to discharge, not only the ordinary functions of an ecclesiastical court, but also many that pertain to a manorial jury. By far the greater part of the record is, however, occupied by memoranda of causes which in the ordinary course of things would have come before spiritual judges. The editor gives in his preface an analysis of the contents of the act-book; from it we gather that there is mention of but two cases of theft, and one of receiving stolen goods, while there are nine matrimonial causes. We must not therefore conclude that disputes relating to espousals and marriage were at Ripon in the fifteenth century far more common than stealing. The truth undoubtedly is that thieves were usually dealt with, as at present, by the secular arm, while controversies as to a religious ordinance must all of them have come before the Church tribunal.

The indefinite state of the law of marriage in the Middle Ages, in this and almost every other European country, gave cause to unnumbered scandals, and some of the most cruel wrongs that disgrace its annals. Not only were irregular marriages very frequent but many unions which would now be held to be good were then rendered void by proof being given of a pre-contract. It was not until the sixteenth century that these scandals were somewhat abated by national legislation and by the decrees of the Council of Trent; even at present there are improvements to be wished for. If it be mere Utopian dreaming to speculate as to the wisdom of one uniform marriage-law for Christian Europe, it does not seem unnaturally stupid for men to ask that on so important a matter there should be unity throughout the British Isles. Evil as our present case may be, we are better off than our forefathers were, in whose path of wedded felicity previous espousals, real or pretended, threw many difficulties unknown at present. Now if a lady's lover deserts her and marries another she has to content herself with an action for damages; then, if she could produce evidence of a pre-contract, however clandestine the espousals might have been, she stood a good chance of the far sweeter revenge of hearing her lover's marriage with her rival declared void, and the children, if there were any, pronounced illegitimate. So very few proceedings in matrimonial causes of a date prior to the Reformation are accessible in print that, for purposes of social history, we value very highly the few which Mr. Fowler has recovered for us. They relate, without exception, to poor people, or those of the middle class, and this, so far from being a disadvantage, is much in their favour. Students of the past are anxious to realise as far as may be the social, moral, and religious life of their predecessors. And they are far more likely to gather facts which are really useful from quite ordinary cases than from the world-renowned litigations of Henry VIII., and others such as he, who

could afford to import endless form and delay into the proceedings, and who had it in their power, as a last resource, to override or alter the law when it bore heavily on them. The longest and most important of these causes is that of Margaret Donnyng, who was, as was alleged, contracted in marriage to John Owlthwayt, "caementarius," and likewise to a certain Thomas Swan, of Richmond. We have in evidence the words she used, not as in other cases in a Latin version, but in plain English, as the young lady spoke them:—"Here I take yow John to have to my husband to dede us departe." They are not verbally the same as the form in any of the service-books we have examined, but they were certainly sufficiently like those authorised by the Church to be valid. After these words were said Margaret fetched a cup of beer and handed it to her lover, who drank of it; he then returned it to the young woman, who drank also. Whether this drinking from one cup was held by the contracting parties to be a needful part of the rite is not stated. We may, however, be sure it would not have been recorded had it not been understood that meaning was attached to it. Probably neither the parties concerned nor the members of the court which tried the cause were aware of the high antiquity of the custom.

The impression which the act-book, taken as a whole, gives us, lends no countenance to the glowing pictures which admirers of the Middle Ages are wont to draw of a time when the Church had no heretics to contend with, and could therefore devote all her energies to waging war upon moral evil; still less does it confirm those dark visions of moderns who seem to think that civilisation lay dormant for a thousand years (*cf. Draper's Conflict Between Religion and Science*, 264). But few atrocious crimes are noticed; but there are twenty-four cases of clerical incontinence, some of which are of a gross nature. The penances for these faults were usually commuted for a small pecuniary payment. Riots, too, were frequent; but most of them were probably either affrays in pursuit of game or contests as to rights of property, acts which were in some degree justified by the popular opinions of the time. There is one curious case of assault within the minster during the time of divine service, which might have ended very seriously for the persons concerned. On the feast of the translation of Saint William, Archbishop of York, two Ripon tailors, Reginald Sele and Edmund Styckland, quarrelled and came to blows. Reginald, it is affirmed, struck his adversary on the head, without any reason whatever, drew his dagger, and generally bore himself as we are told, "tumide et pompose, ad magnum timorem personae et praejudicium immunitatis ecclesiasticae." We cannot find that punishment was awarded; perhaps the case broke down in the hearing. If it were proven, we imagine that the offender would be compelled to do severe penance, for not only was it, according to the ideas of the time, a flagrant offence to fight in a church, but there was also danger of great inconvenience, loss, and expense to the chapter. Had blood been shed therein the minster would have suffered defilement,

and no service of any kind could have been held therein until it had been reconsecrated.

We have evidence that almost the whole population of Ripon were wont to fulfil the canonical obligation of confessing before and communicating at Easter. In 1481 one contumacious person was discovered. Isabella, the wife of Robert Greve, not only had abstained from receiving the sacrament, but had partaken of flesh meat in times of fasting; she had, moreover, added to her offences by telling falsehoods, saying she had confessed and communicated at Mount Saint John, a commandery of the Knights Hospitallers near Thirsk; order was therefore given that she should be excommunicated—"cruce erecta, pulsatis campanis, candelisque accensis et extinctis."

There are a large number of wills enrolled in various parts of the volume. To many readers they will prove by far the most interesting portion of the record. They are mainly those of tradesmen and folk of the lower ranks of life, and on that very account throw a stronger light on the life of the time than do the testaments of the by far greater people which have appeared in former publications of the Surtees Society. The will of John Sendale, canon of Ripon and of York, which bears date 1467, contains many noteworthy bequests. It is, indeed, one of the most interesting documents of the kind that we have seen. After leaving his soul to God, the Blessed Virgin and all saints, and his body to be buried in the nave of the Collegiate Church of Ripon, near to the altar of the Holy Trinity, he desires that a Trental of Saint Gregory may be said for his soul, and that *Gl. 13s. 4d.* may be given to poor, decrepit and impotent folk at his burial; then follow sums to many of the York guilds, to the fabric of the house of Saint Robert of Knaresborough, to the monastery of Beauville, to the Carthusians of Hull, to the prisoners in the Archbishop's gaol at York, and to cripples and lepers in the same city. After many other gifts we come to twenty gold nobles, *antiqui ponderis*, for the use of the shrine of the blessed (beati) Richard Scrope, formerly Archbishop of York; this passage is especially noteworthy as showing how popular devotion outran ecclesiastical decrees. Scrope was, as Mr. Fowler says, "the most beloved and venerated of all the archbishops of York." His murder, for we cannot call his execution by any milder name, had made a deep impression on the hearts of the northern people, to whom his family was well known. No sooner had his body received burial than the people—

"flocked in crowds to make prayers and offerings at his tomb; and his fame would doubtless soon have altogether eclipsed that of St. William, had not very peremptory orders come from the King, the Archbishop of Canterbury, and the Dean of York, who was Chancellor, against all adoration of the late Archbishop, publication of his miracles or oblations at his tomb. . . . In a convocation held in 1462, one of the matters under consideration was the canonisation and translation of Archbishop Scrope, and, though the matter appears to have dropped, the present bequest shews that five years later one canon of York at least looked forward to its being some time carried out."

The order against placing offerings at the Archbishop's tomb seems to have been re-

called or to have fallen into disuse. An inventory of the treasures of York Minster taken very early in the sixteenth century (*Fabric Rolls*, 223) shows that the tomb was then hung around with costly offerings. Among them were ships, oars, arrows, hands, feet, eyes, hearts, and many other memorials of supposed deliverance from peril or sickness.

The Appendix to the act-book contains several documents of value. The most important, to any one not specially interested in Ripon, is the "Inventory and Funeral Expenses of Margaret Pigott," taken in 1485. It is unfortunately imperfect, but even in the mutilated state in which it has come down to us we are furnished with a vivid picture of a fifteenth-century household. The funeral pomp may almost be recalled once more to sight by anyone who reads the latter part of the document.

Mr. Fowler has discharged his editorial duties honestly and well. There are remarkably few errors in the text, and the notes are to the point and short. Unlike some former Surtees books, this volume has a copious index. EDWARD PEACOCK.

Pidgin English Sing-Song. By C. G. Leland. (London: Trübner & Co., 1876.)

"PIDGIN-ENGLISH Sing-Song" is the pleasant result of an expedition of Mr. Leland's into one of the queer regions of character and expression with which he is familiar. The word "pidgin" has been known in England for many years as a Chinese expression not less useful than "nice" is, according to Mr. Disraeli, in our own speech. Mr. Simpson contributed an amusing article to our knowledge of this *lingua franca*, and Mr. Leland, taking example by the moral rendering of *Excelsior* named *Topside Galow*, has told a variety of anecdotes in simple pidgin metre and unaffected prose. The student of comparative philology and of the development of language will find a great deal to interest and instruct him in Mr. Leland's prefaces and notes. Pidgin English has grown up out of the vocabularies which instruct native servants in the "words in use among the red-haired barbarians." These words are printed in a way that would delight the uneasy people who believe in phonetic spelling. *Yang-ki* is not very like "uncle," nor does *ha-sze-man* at once suggest "husband." One would not take *ki-lin* for "green" at a first glance; but it is by improving on these obscure germs of talk that the Chinese at last acquires the fluency of Ah Chung, who contributes didactic notes to Mr. Leland's *Sing-Song*.

Perhaps the most diverting feature of Mr. Leland's verses, next to their extraordinary fluency in this strange medium, and to the wonderful success with which he finds rhymes when the reader almost gives him up for lost, is the almost entire absence of morality in his characters. Thus, Wang-ti saves the life of an American photographer, and then confides to him the great sorrow of his existence. Wang-ti was dull, but ambitious; and, since Government had kept a strict eye on the tricks of the Heathen Passeur, it was impossible for Wang-ti to score a good

class in the schools. His American friend, with equal unscrupulousness, says :—

"And if the thing will help you, if nothing else avails,
I'll photograph them classics upon your finger-nails—
I see you wear them awful long (for gouging, I suppose);
I'd put the Astor Library upon such nails as those."

Wang-ti thus "goes topside" when the *Kuy-jun* degrees are given, and uses the influence which his position lends him to get his friend Government contracts.

"Chinese and Yankee in one firm could squeeze whole worldly ;

Dis my glate molal-pidgin of he stoly of Wang-ti." Ah Chung objected to the printing of this tale, because "S'posey dat sing-song go China-side—more dan tlee hundirt millium Chinese get he nailos specklum an' go fo' examination." He adds in a postscript that he will be glad to pay for a consignment of magnifying spectacles, and for instruction in photography. To this pitch of degradation has the baneful examination-system reduced an ancient, an intelligent, a frugal people! And yet the University of Oxford is going to spend money on building new examination-schools.

"Captain Brown" is the story of an American who saved a Chinese political prisoner from starvation. It chanced that the Captain went to consult a Medium, and the poet moralises thus :—

"Now when my talkee mejum an' spilit lappins Hai!
My savvy 't'at you tinkee he found out by you fan kwei;
My fin, you blutal ignolance make fall one piecée tear,
Chinese hab catch 't'at pidgin now 't'his tenty tousan year."

What follows is very edifying, and should be a real comfort to Serjeant Cox and the Psychological Society :—

"He Captin go to mejum, and mejum go to sleep,
An sleep go into wind-fire-land, where allo ting be deep.
That mejum just hab catchee light—jist go to talkee true,
When allo once he stop an' say 'This pidgin no can do.
My catch one spilit tell my all—but he can no be heard;
Some nother spilit hab got here—he no can talkee word.
They makee muchee bobbely—too muchee clowd aloun'—
They wantchee muchee bad one tim to chin-chin Captain Brown."

They were, in short, the *manes* of the prisoners, now free among the dead, whom Captain Brown had saved from starvation. Ah Chung says, "my no savvy; s'posey belongy pukkhā or no;" *πύκα φρονέων* is Ah Chung, and of a salutary scepticism.

The patriotism of the exiled Chinamen is not a very desolating Heim-weh, but the song of the Green-tea Land, from the "Californee side," is a pretty idyll in its original way. In the fogs of 'Frisco, the Chinese does not sit down and weep, but consoles himself in a practical fashion.

"What-tim he almon' flower hab white, when peach tlee blongy pink,
My smokee opium pipe, galaw, an muchee tim my think
'Bout allo pidgin Chi-na-side no fan-kwei understand
In olo Fei Chaw Shang inside—my nicee Gleen-tea Land."

These are only specimens of Mr. Leland's songs, which are likely to make their readers think rather kindly of the children of the Celestial Empire, so long as these children do not invade us with their cheap labour. Probably there might be material for a tragic sing-song on the "Californee side," if Mr. Leland looked for it there. His stories in dialect are perhaps less interesting and less easy to follow than his verses, but his book is a very clever and diverting one, and does not need so much difficult attention as the first glance at it would make one expect.

A. LANG.

Journey in the Caucasus, Persia, and Turkey in Asia. By Lieutenant Baron Max von Thielmann. Translated by Charles Heneage, F.R.G.S. (London: John Murray, 1875.)

OF late years books on the Caucasus have been sufficient; books on Turkey have not been wanting; books on Persia have abounded. All are more or less readable; but all are not read. Few probably will survive the generation in which they appear, as productions of standard merit or reference; and yet few have not at least some new matter of interest worthy of paste and scissors. The work with which this notice is headed appears to us quite up to the average mark of books of travel, whether considered in respect of style, of method, or of practical utility.

Baron von Thielmann, noting the want of a trustworthy guide-book for an explorer contemplating a journey to the Caucasus, cites a few French or German authorities of whose experience he could avail himself to a certain extent. He winds up his preface with the hope that, should his pages "fall into the hands of one fond of travelling, and be the means of inducing him to visit these fair and distant lands," they may serve to help him on his way. He started from Odessa in August, 1872. About one year before, General Sir Arthur Cunyng-hame had embarked also for the Caucasus from the same port, and, though he found his way to Tiflis by a different route from that pursued by the Baron, the country between Tiflis and Petrovsk is described by both travellers, and they must have followed much the same zigzag road, reversing only the order of direction. The General, too, prefaces his volume with the assurance that should his "account excite a desire in any lover of sport or travel to visit the Caucasus, the author will feel that his labour has been rewarded." In all probability Baron von Thielmann, when writing his preface, had not seen Sir Arthur Cunyng-hame's book. That he knew of Mr. Freshfield's *Travels in Central Caucasus*, however, there is evidence in his allusion to that gentleman's ascent of Kazbek.

For us, in consideration of the sufficiency of previous Caucasian explorers, the second volume possesses the greater attraction. It describes a journey from the Caspian to Baghdad by Tabriz, Urúmiāh, and the valley of Ruwándiz; and a further journey from Baghdad to Bairút by Hilla, the desert, Palmyra, and Damascus. Here we have a region less likely to be overrun by travel-

lers from the West, but not a whit less deserving of attention, or less provocative of interest. Between the fires of Baku and the western slopes of the Lebanon the literary traveller should find ample material for a score of volumes; but he should beware—be it said *en passant*—of accepting the definition of Indian priest and pilgrim current in the Absharán peninsula, and endorsed in the work under review, with the same confidence accorded to the local account of the naphtha springs.

The chapter headed "Petrovsk to Tabriz" commences the land journey from Lenkoran—a station not long since, it is believed, distinguished by having a military Governor and small Russian garrison, but now comparatively deserted. From the sea it is a quiet-looking village, with pasture, cultivation, and green trees; of its houses, the larger are tiled, white-walled, and beautiful; the smaller are thatched and ordinary. Our author does not give a glowing account of its inner conditions: there is no hotel there; it is dirty and ill kept; and the night passenger is in danger of watery pits, if unprovided with a lantern: even the famous tiger which Alexandre Dumas placed upon one of its main approaches is pronounced to be a myth. The district of Lenkoran extends to the Russo-Persian frontier, and the name has been substituted for that of Tálísh, still seen in many maps: but it is a question whether its limits have ever been internationally agreed upon since the treaty of Türkmancháí. From Astara, the boundary town, Baron von Thielmann passed into Persia, over a mountain tract rising to a height of 6,700, and descending again to a plateau of about 5,000 feet above the sea. Continuing the route through Ardabil and the province of Adarbáijan, and passing to the east and south of the Savalán Dágh, his party debouched eventually upon the high road from Tabriz to Tehran—probably between Saiyidabád and Hajji Agha. Neither the map nor the text is as precise as we could wish on the actual point of junction; but the small salt lake gives a better clue than the "little village Kalah" (or fort), a name which might be found in ninety out of a hundred marches through the length or breadth of Persia. This very rough and unusual journey may be said to have lost its difficulties when the "Anglo-Indian Telegraph, with its poles, was sighted;" for then, to quote the writer's words, "it seemed as if we had been removed, all of a sudden, to civilised Europe."

The next chapter takes the reader through Western Persia and Kurdistan to Baghdad. Urúmiāh is not visited, because the route lay on the east side of the lake; but the country traversed appears to have as many *tumuli* as are observed on the opposite shores. Several, we are told, bore Arabic inscriptions. One "curious apparently artificial mound," of about 60 feet in height and 300 feet broad, was inspected, but no trace of any monument appeared. We may here remark that some of those on the west of the lake, supposed by the resident missionaries to be hills of the ancient Gabars, were excavated many years ago, and found to contain buried walls or masses of stone, together with human bones. At Souk-

Boulak, the restless Khan showed his interest in European politics by asking pertinent questions on the Franco-Prussian war; and treated the travellers to the sight of a Kurdish hunt and national feats of horsemanship. Hence to Mosul, the more southerly and seemingly easier of the two routes leading through the valley of Ruwandiz was chosen; and, having reached the base of the Zagros range at Hani, the Baron looked forward to a "most difficult mountain passage." However, to continue the quotation, he reports: "To our great surprise we reached the Turkish frontier after an hour's ascent of a steep but otherwise not arduous path, leading across a ridge some 1,200 feet in height above the valley; the actual watershed lay lower down." Following this valley of the Ruwandiz river, which "abounded in magnificent views," to the town of the same name—where they came upon the Kádhi listening to a claim for arrears of wages—the travellers pushed on to "the border of the actual mountain range," beneath which was "the undulating plain of Assyria traversed by the Great Záb." From Záb to Mosul, and Mosul to Baghdad, the route is interesting, but more in the beaten track.

A week at Baghdad is pleasantly described in the chapter concluding the actual narrative. Surely Ráúf Páshá or Herr Hartmann might have saved the author the diplomatic expedient employed to obtain a near inspection of the golden domes of the Kázimáin. Admission to the interior is another matter: in this we have always understood, and have ourselves verified the fact, that a difficulty exists. Ctesiphon is thus portrayed:—

"I do not wish to assert that the ancient royal seat of the dynasty of the Sassanians—which is now called Tak-i-Kesra by the people—is the grandest single ruin which exists; yet, although cities of ruins, such as Nineveh, Babylon, and Pompeii, may create a more powerful impression by the *ensemble* of their monuments, neither classical antiquity nor the East possesses an edifice which by its gigantic proportions fascinates the eye and strikes the mind with awe in the same degree as Tak-i-Kesra. The palace rises from the midst of the desert as a spot many miles distant from any human habitation."

The want of a photograph of the noble ruin is lamented. But so far from none having been taken, as surmised, we can certify to having seen two, if not three, good ones. After Ctesiphon, a visit is paid to Hilla, the site of Babylon, and to Karbala. The desert is fairly invaded on December 12; Palmyra is reached on the 26th, the monotony of the road having been broken by little else than the roar of a lion; Damascus is entered late on the 30th, and one day more given to an examination of the city and suburbs; and on New Year's Day, 1873, the French mail-coach brings the Baron von Thielmann and followers into Bairut in time for the homeward-bound Austrian Lloyd's steamer *Saturno*. A kind of supplementary chapter on travelling in the Caucasus, Persia, and Asiatic Turkey, should be of value to future tourists.

It is somewhat a libel on Poti to say that no European has passed the night there and been spared by the fever. Such language describes in too dark colours the miasma of a decidedly disagreeable place. Many visitors

can bear testimony to coming unscathed through the ordeal stated. Our own experience is of about twenty-four hours, during which we managed to sleep there; and we rose in the morning so far refreshed as to endure the long day's jolting necessitated by a journey over very bad roads in that wretched vehicle, a "troika," to an inhospitable post-house at Marand.

Defects in the translation have been elsewhere noted, and no doubt some are serious enough to warrant the objection that sufficient care has not been taken in adhering to the author's meaning. Where, as early as page 10, error is instanced in four words of a description of the gate of the Baidar, there is clearly something wrong in the whole passage. To us it seems neither in accordance with the German text, nor a true interpretation of the author's meaning to relate how "*rising suddenly from a depth of 1,550 feet, the sea*" meets the gaze of the traveller. The italicised words might rather have been expressed by "at" with advantage, and the "suddenness" made to apply to the sight presenting itself. Again, "cast over," in the following page, would have been better rendered by "over-cast;" and, as in the early pages, so later, many amendments might readily be suggested. Moreover, by inattention to the precise figures of measurement, the translator exposes himself to scientific as to linguistic criticism. We believe, however, that a revision rather thoughtful and systematic than strictly laborious would make the volumes acceptable in their English dress, for the translator must be allowed to have shown signs of a certain aptitude for his task not always to be recognised in like cases.

F. J. GOLDSMID.

NEW NOVELS.

The Prime Minister. By Anthony Trollope. In Four Volumes. (London: Chapman & Hall, 1876.)

The Bertram Family. By the Author of "The Schönberg-Cotta Family. (London: Daldy, Isbister & Co., 1876.)

Saint Nicolas' Eve, and other Tales. By Mary C. Rowsell. (London: Samuel Tinsley, 1876.)

Oliver of the Mill. By Maria Louisa Charlesworth. (London: Seeley Jackson, & Halliday, 1876.)

MR. ANTHONY TROLLOPE'S novels are distinguishable from those of all his contemporaries, and even from those of the immediately preceding period, by a more determined realism of treatment. Nothing would be easier than to dwell on the superior gifts of Bulwer, Thackeray, and Dickens, and to show how each of these celebrated novelists has exhibited qualities of mind and felicities of work to which Mr. Trollope makes no pretensions whatever. Yet, though it is premature to augur for him a place beside them in the permanent record of famous English authors, there can be no question that a student of manners in the next century would derive a far more correct idea of the social thoughts and customs of the present day from his novels than from those of his more eminent rivals. From Dickens, in

truth, no correct picture can be derived at all. He paints individuals, not classes; and his individuals have all a touch of exaggeration and caricature about them which lessens seriously their value as types. Bulwer Lytton, in his turn, is too studiously artificial, and, incomparably better versed as he was than Dickens in the ways of society, there is not enough ease and freedom in the acts and dialogues of his characters to let us lose for a moment the sense that they are consciously playing high comedy on a stage before a critical audience. And Thackeray, towering as he does intellectually above the other two, aims rather at the creation of idealised types of the very highest art than at reproducing exactly what he saw. Becky Sharp, Blanche Amory, Colonel Newcome, are each perfect in their way; but as a fact one does not meet them, though certain family likenesses suggesting parts of their temperament are daily encountered. But Mr. Trollope's aim is best indicated by the title of one of his more recent works, *The Way we Live Now*, and he has had the courage to abandon plot, or at any rate, to make it entirely subordinate to delineation of manners, and to depict people and conversation much as they really are in the world around us. He is the only English novelist, in fact, since Miss Austen, who has striven to fathom the resources of the entirely commonplace, and to contrive that, instead of proving dull, it shall be exactly the attraction which gathers an audience round him. This is true in a high degree of his last book. *The Prime Minister* is the sequel of the two narratives of *Phineas Finn* and *Phineas Redux*, and grows out of them as they in turn grew out of *Can You Forgive Her?* and it in part out of *Doctor Thorne*. This group of stories has the especial merit of doing for contemporary politics in their purely social aspect what Mr. Disraeli's incomparably more brilliant *Coningsby* and *Sybil* did for the Young England phase of thirty years ago. And there is literally no other writing, nor group of writings, given to the world as yet, which so faithfully delineates that intricate combination of social influences which is due to our system of Parliamentary Government by party. The Prime Minister of the story is, of course, that Duke of Omnium whom we all learnt to respect, if not exactly to like, as Plantagenet Palliser, the laborious commoner and rising minister of finance, whose ideal in life was the introduction of a decimal coinage. The character is consistently developed, and with a higher degree of artistic skill and insight than many critics will have been prepared to expect from Mr. Trollope. If he had been drawing from life, as Mr. Disraeli did in his political portrait gallery, and as he has lightly done himself when sketching Lord Brock and Lord De Terrier, Mr. Gresham and Mr. Daubeney, this would prove only close and keen observation; but the Duke of Omnium is his own creation, and no Premier who has held office in this century can be thought to have suggested him, albeit in his extreme sensitiveness and reserve some traits of the late Lord Aberdeen may be called to mind. The feelings of a statesman whose entire interests and sympathies lie in the House of Commons

and in a special department of the public service practically confined to that Chamber, transferred reluctantly to the House of Lords and to the general control of Government, for which he not only thinks himself, but is, unfitted from lack of breadth, grasp, and sympathy, are very keenly analysed, and withal the growing love of power for its own sake, and unwillingness to relinquish it even for the higher public good, are drawn with unexpected felicity. Also the Duchess, our old friend Lady Glencora, is developed with equal success, and, as she is positively the only female character of real interest whom Mr. Trollope has ever drawn, it is pleasant to have her peculiarities displayed under a new set of conditions. Two or three of Mr. Trollope's ladies, had he elaborated them a little more, might have vied with Lady Glencora in favour—such as Mrs. Grantley, Lady Lufton, and Miss Dunstable—but, as a rule, his heroines are missish and uninteresting, and Lily Dale one of the most objectionable young women, to be perfectly respectable, in the whole range of fiction; while Lizzie Eustace's raffishness excludes her from the regard which every well-regulated mind must entertain for Becky Sharp, her congener in many particulars. The heroine of the private story which runs its course alongside of the Prime Minister's public career is no exception, and it is impossible to bestow on her the commiseration which Mr. Trollope asks for her mistake in life, or to approve the constancy of the lover whom she rejected at first. But her adventurer husband, Ferdinand Lopez, is as good a study, in his way, of the smaller fry of City rogues, as Melnautte in *The Way We Live Now* is of the contractor and speculator on a large scale; while the humours of Sexty Parker and his wife show that Mr. Trollope has not exhausted that stratum of lower middle-class life which he "prospected" in *Miss Mackenzie*. The decorous county-family life in Herefordshire is good, but not so good as the annals of Barset; and the real merit and advance of *The Prime Minister* is that improvement in the delineation of character which has been mentioned above.

There can scarcely be two writers more diametrically unlike in scope and temperament than Mr. Trollope and Mrs. Charles. Nevertheless, there are two points of resemblance between *The Bertram Family* and *The Prime Minister* at least as close as the analogies discovered by Captain Fluellen between Macedon and Monmouth. In each case the book is part of a chronological series, and must lose more than half of its interest for those who have not made acquaintance with the characters in an earlier stage of existence. The good people of the present book trace up to the "Schönberg-Cotta family" itself, two hundred years ago, and down through various subsequent excerpts from their fictitious records to the present day, a much more serious demand on memory than Mr. Trollope makes when he takes us down from Mr. Septimus Harding's first troubles as Warden of Hiram's Hospital at Barchester to the fall of the Omnium Ministry. The other point of likeness is that there is no plot to speak of, as Mrs. Charles aims at delineating religious character and emotions, just as Mr. Trol-

lope does social manners and customs. Her book is a cultivated and devout one, with occasional touches of nearly epigrammatic keenness which hint at the old Eve hidden under the demure and almost Quakerish coif and wimple. There is perhaps more resemblance to Mrs. Whitney than to any other contemporary writer, but the New England quaintnesses and humour, as well as the odd flavour given to the religious discussions of the American author by her Swedenborgian disquisitions, are absent—not for the worse, some readers will think.

St. Nicolas' Eve is the best, as well as the longest, of the tales in the volume to which it lends its name. It is a slight French story of the type which Mrs. Macquoid, Miss Roberts, and Miss Peard have made familiar to English readers, of the vagaries of a rural coquette, her punishment, and final pardon, all told gracefully, and with facility which needs only diligent practice to become skill. The next tale, English of the seventeenth century, is less correct in local colour, and Miss Rowsell seems as unable to master the nobiliary system of this country as though she were a Frenchwoman, for she styles a duke's younger son "the Honourable Mr. Skiffington," and supposes him to seal his letters with a coronet. The remaining items are little more than outlines, and the whole book is of the *Household Words* school, but fairly readable, and exhibiting capacity for improvement.

The author of *Oliver of the Mill*, however little known in the higher walks of fiction, enjoys a much larger reading public than writers whom a critical estimate would place on an unapproachably loftier plane. *Ministering Children*, her most popular tale, has reached an issue of a hundred and forty-nine thousand copies, and her remaining works about as many more in the aggregate; while it is quite certain that her name must be absolutely unknown to hundreds of those literary students who assign as important a place in their reading to novels and tales as to any other kind of composition. An examination of Mrs. Charlesworth's present book, however, supplies at once the reason and the justification of her popularity. *Oliver of the Mill* is not in any sense a clever book—though there are one or two shrewd notes of character—nor has it any special plot or noteworthy incidents, for its most sensational adventure is that of the hero playing truant when a child, and having to sleep away from home. But it is a devout and kindly religious story, belonging (though the writer seems to be English by religion as well as by nation) to that school of Lutheran pietism which owes its origin to Spener, at the beginning of the last century, and has always enjoyed a certain measure of influence here since it was first introduced, mainly by the Moravian Brothers, to English readers. The book is entirely free from controversial bitterness or sectarian rigidity; and, so far, though not strong intellectual meat by any means, must be far wholesomer food than most of the other writings and sermons to which Mrs. Charlesworth's public is probably accustomed. One point needs reconsideration on the score of credibility, apart from a graver objection

of which the author would most likely fail to see the cogency. It is the theological and liturgical precocity of her hero, who, when a very small boy, produces several times in the volume what is known to liturgiologists as a "farcéd Paternoster," no easy thing to write in cold blood, even for an adult divine, but which no child of ten could extemporise. If he could, he must be a deal too good and clever for this wicked world, and had better be quickly buried.

RICHARD F. LITTLEDALE.

CURRENT LITERATURE.

Stray Studies. By John Ormsby. (Smith, Elder and Co.) Macaulay compares the conduct and chances of a man who collects his essays from magazines and publishes them in separate volumes to those of the artist who takes his picture out of a gallery and exhibits it by itself. Works that pass in a crowd of daubs often seem of little value when they are exposed to concentrated attention. Macaulay's hesitations were quite unnecessary, but minor writers ought to consider his opinion before they set up as authors on the strength of articles in reviews. The questions for them are, have these articles been liked on their first appearance; will readers be glad to have them in a convenient shape; have they any unity of form and treatment? Mr. Ormsby's *Studies* are very slight, but they do possess these three requisites. One enjoyed them on their first appearance; one is glad to have them in a pretty little volume; and they display the unity of a pleasant and not unscholarly tone of humour. The article on "People I Have Hated" is extremely adequate, if not exhaustive, and the Man with the Smile, which he wears "as a good provisional expression of countenance," is very well hit off. There is an anecdote in the paper on "Boys" which cannot be read with gravity, and the sketches of the life of dog-fanciers and prize-fighters seem to have been "drawn from the quick." The retrospective review of *Sandford and Merton* appears to us to err in omitting to notice that Harry is the germ of Tom Brown. Add Christianity and the beautiful polish of Rugby life to Master Sandford's qualities, and you have the early muscular Christian. Does Mr. Ormsby himself not think that the quotation about Froissart and the English way of taking pleasure is a quotation one has a right to hate?

Wildfire. By C. J. Dunphie. (Tinsley Bros.) About Mr. Dunphie's "erratic essays" it is more difficult to speak. Mr. Dunphie says that they were "originally published under a *nom de plume*," and perhaps it would have been as well to let the *nom de plume* still cover them with its friendly shadow. We do not remember having seen any of them before; we do not like them now we see them, nor want to have them in a handy shape; and Mr. Dunphie acknowledges that they do not possess unity of tone. "Though some of the Essays affect a thoughtful or critical tone, and are therefore meant to be read in a serious spirit, many more of them begin where common sense leaves off." That would be less important if any other quality took the place of common sense. Mere garrulous nonsense without humour makes the most tedious sort of writing in the world. Is it funny to say of a conceited soldier that "his speech is only of the service, though he never smelt powder stronger than tooth-powder, and perhaps not overmuch of that"? Or, again, "I know a man who is as ugly as sin, and not half as pleasant; but then he suffers from bunions, poor fellow," and so forth. Again, here is a passage from a more serious essay:—"Through the most momentous eras of our earthly career, every man and woman of us must walk, not, it may be, uncared for, nor unloved, but alone, all alone. The

sense of solitude inspired by this thought is indeed saddening; yet it may be turned to profitable account." Neither the thought nor the expression of this commonplace is worth print and paper. To shake off the natural depression which these extracts must cause, let us end with a sample of Mr. Dunphie's own poetry, a verse from "A Song of the Rinker"—

"Gliding o'er the asphalte at a furious rate,
Taking it for ice, too, fancying they skate!
With each other flirting, waggishly they wink;
Oh the rosy rinkers rolling round the rink!
Chorus. Sing a song of rinkers, &c."

Einleitung in den Dialogus de Seaccario. Von F. Liebermann. (Göttingen: Peppmüller.) It is the glory and the shame of Englishmen that so many things which belong to their own history, language, and literature have an interest for foreigners even greater than is felt by ourselves. Until the publication of Professor Stubbs' *Select Charters* a few years ago there were probably few men of ordinary reading and education among us who had even heard of that wonderful contemporary picture of an English institution in its infancy, the *Dialogus de Seaccario*. Of course it was always well known to antiquaries, having been published at the beginning of the last century; but a document so remarkable, and on the whole so free from technicalities, ought certainly not to have remained so long their exclusive property. Yet even Professor Stubbs did no more than reprint this dialogue from Madox without affording the student any analysis of its contents; nor is the want supplied for English readers to this day. Herr Liebermann, however, has written an admirable introduction to the work in German, of which we very much wish that he could be induced to authorise an English translation. His account of the author, Richard Fitz-Neal, and of the two preceding great finance-ministers of the same family, whose official knowledge he inherited, of the reform of the Exchequer by Henry II., and of various other matters connected with the times and the composition of the work, is exceedingly lucid and valuable.

A Handy-Book for Guardians of the Poor. By George C. T. Bartley. (Chapman and Hall.) The main object of this admirable little book is to instruct guardians of the poor in their difficult duties, and to set clearly before them the proper principles on which the administration of relief should be conducted. It is no easy matter to deal equal justice to ratepayers and paupers; to check indolence and imposture and encourage thrift and independence; and the guardian who desires to act justly and consistently must be prepared to spend time and trouble in investigating the cases that come before him, and also to encounter much opposition from his fellow-guardians and the charge of harshness from those whom he is striving to benefit. It is quite possible even that some readers of Mr. Bartley's book may consider that he is over-severe in his remarks on the treatment of widows (chapter ix.), and that his condemnation of Workhouse Schools (chapter xxvi.) is too sweeping. But, speaking from an experience of many years, we must express our entire agreement with all that he says on these subjects as well as our general approval of the whole tenor of his work. In our present system of Poor-law administration there are not a few shortcomings and some positive evils. By it provident habits are often discouraged, deception and dependence fostered, and filial feeling is dwarfed instead of being developed. Reform in these and in other directions is greatly needed; pending which much good may be effected by the election of men (and women also) who are capable, as guardians, of taking a large and liberal view of the subject with which they have to deal. From such members we may reasonably look for a satisfactory solution of that difficult problem which just now is uppermost in men's minds—namely, the education of the children of the poor. On it more than upon aught else depend our hopes for the permanent

reduction of pauperism and the amelioration of the condition of the working classes. Mr. Bartley's book is written in a pleasant and practical way, and deserves the attention not only of those who seek or hold office, but also of all persons who are interested in the welfare of the poor.

Arnobii Adversus Nationes Libri VII. Ex Recensione A. Reifferscheidii. (Corpus Scriptorum Ecclesiasticorum Latinorum, editum consilio et impensis Academiae Literarum Caesareae Vindobonensis.) (Wien: Gerold's Sohn.) In nine years the Vienna Academy have only issued four volumes of their library of Latin ecclesiastical writers, and unless a great deal of progress has been made underground we may expect the century and the projectors of the scheme to pass away long before the work is done. Though Arnobius was popular in St. Jerome's time, we have only one corrupt MS. left, upon the strength of which he has been much edited and emended with a diligence which encourages a hope that scholars may be found to devote themselves 1,500 years hence to establishing a correct text of the leaders of the *Daily Telegraph*, and determining how many of the difficulties which a reader of that day must find are due to the carelessness of the printer and proof-reader, and how many to an uncontrolled desire for fine writing. Arnobius has been called the "Christian Cicero," and he really has a sort of right to the title: he had been at pains to find out how Cicero managed his exclamations and amplifications, and he gives a dull but recognisable imitation of them. In substance he is dull but not uninteresting. We know so very little of what Christianity meant to educated laymen who accepted it that the diffuse and incoherent attack on paganism, which was exacted of Arnobius as a condition of baptism, is worth reading. One very curious trait is the half-Gnostic way in which he speaks of the *deus princeps* who cannot be imagined capable of anger or of direct creation. There is nothing that can be called a proof of acquaintance with any Gnostic system or inclination to any, so that these resemblances must be set down to the diffusion of the common-places which the Gnostics disseminated in order to create an appetite for their specific teaching. Another curious thing is his entire indifference to the plea that Christianity had brought bad luck upon the Roman empire: one reason of this is his indifference to the Roman empire, which, in his eyes, means the aggrandisement of one town at the cost of the world; another is the temper which those who wish to share it call unworldliness, and those who do not a wish to save one's own dirty soul. He has a very low opinion of human nature, his psychology is materialist and sensationalist, and his Christianity seems very nearly to reduce itself to theism which is authenticated as having been published by a superhuman Being who had proved Himself superhuman by His wonderful works. What Arnobius wants to have authenticated in this way is not so much the existence of the *princeps deus* as His promise of everlasting life and blessedness to man. Throughout, the existence and perfection of the First Cause are assumed as self-evident in themselves, and a sure criterion of everything else; and no doubt the residuum of Greek and Roman religion coincided with the postulate of Hebrew religion, though it is rather an inconsistency that he condemns mythology by the help of this abstract idea of the Divine perfection, and refuses to use the same idea in his estimate of human nature and its prospects, for he argues from experience that we are too vile to have claims on our Creator. At the same time we are not too vile to be sure that beings who removed pestilences and the like on the institution of idolatrous ceremonies (which Arnobius is inclined to admit as matter of historical fact) cannot possibly have been Divine.

Schiller's Briefwechsel mit dem Herzog Friedrich Christian von Schleswig-Holstein-Augustenburg. Edited, with Introduction, by F. Max

Müller. (Berlin.) In 1790, when Schiller was almost overwhelmed by the combined pressure of poverty and ill-health, an enthusiastic Dane, of the name of Baggesen, gave to his countrymen so moving an account of his merits and needs that the Duke of Schleswig-Holstein-Augustenburg, in concert with his Prime Minister, Count Schimmelmann, wrote to the poet begging his acceptance of a pension of 1,000 reichsthalers for the next three years. The letter containing this generous, unconditional tribute had been already published, though with some verbal incorrectness, but the devotees of Schiller, knowing that his *Aesthetic Letters* were originally addressed to the Duke, were under the impression that some at least of his other letters must be concealed in the archives of the family; and, on the application of Prof. Max Müller to Prince Christian and the present Duke, further researches resulted in the discovery of about a dozen original letters, which are here contributed to the general mass of "Schiller literature;" other letters belonging to the same series are said to be in the hands of a private collector of autographs, and are likely to be published before long elsewhere, an arrangement which suggests the question whether the mere possession of such documents gives the owner any moral claim to the kind of copyright so often claimed in them to the inconvenience of the reading public. In this case it must be confessed that the letters are not of very special interest in themselves, though they are worth incorporating in any future edition of the poet's correspondence. The most interesting part of the pamphlet is the introduction, in which, curiously enough, Prof. Max Müller interrupts the chorus of self-laudation which has been so audible of late years in Germany, and actually takes the ground that the German people of a century ago—much as it was reviled by literary contemporaries—yet had virtues to which the present generation are strangers, and that the great men of the age of Goethe were given to the fatherland as a just reward for its power of admiring them. Like a complete convert to the doctrine of hero-worship, he maintains that it is not so much Schillers and Goethes as Baggesens and Schimmelmanns that are wanting, but he does not venture on the invidious task of naming any of the unappreciated great ones of the present day.

The Poetical Works of George Herbert have been added to their excellent Aldine Series by Messrs. George Bell and Sons, of York Street, Covent Garden. The editor, Mr. Grosart, has done his work well in respect of the text. In accuracy and completeness his collection is not likely to be surpassed. "For the first time relatively large additions are given from (a) MSS., (b) overlooked books—e.g., six English sacred poems, and nearly the whole of *Psalms Discerta* and *Lucus* from the Williams MS., the 'Psalms' from Playford, and other single poems." Besides such additions, Mr. Grosart gives "the many various readings (a) from MSS., (b) original and early editions." Further, he supplies notes and illustrations such as his wide reading of the necessary literature places easily at his command. For all these services Mr. Grosart deserves, and will receive, the thanks of all lovers of *The Temple* and its author; and, without assenting to the wild and extravagant laudation bestowed by panegyrists, not critics, one may believe that such there will always be, and should always be. We are bound to add that in our opinion what Mr. Grosart calls the "Memorial Introduction" is a great deal too long, and is far from compensating for its length by its judgment and good taste. To say nothing else, it makes the volume awkwardly stout. Sometimes we do not quite know what Mr. Grosart means; often, when we do know, we do not quite relish his style. What a queer phrase "Herbert's own onward" is, on p. xxx. What is meant by a man's "eighteenth-nineteenth" year? A clause on another page is:—"While Henry Vaughan, in almost every way,

bulks out a larger-souled, more nobly-dowered poet," &c. In the well-known line in the *Midsummer Night's Dream*, Mr. Grosart seems to think that "compact" "agrees with" "imagination," instead of "governing" it. Of course the phrase is just like the Duke's description of Jaques as "compact of jara," only the order is inverted. Says Mr. Grosart:—

"We have many 'seething brains,' but lack the 'fine frenzy,' abundance of 'great swelling words,' little of that 'imagination' which is 'compact.' The thick-coming epithets, the laborious and gaudy word-painting, the spasm and mouching of belauded poetry, are the antithesis of what I take to be true Imaginativeness, an essential of which is that it be not diffuse, but compact."

If only Mr. Grosart would be so compact!

Winter Sunshine. By John Burroughs, Author of "Wake Robin." (New York: Hurd and Robinson; London: Sampson Low and Co.) In this original volume we get the cream of an American's first impressions of the "old home" and its institutions, with a flying glimpse at our French neighbours. His "October Abroad" takes up but a fourth of his space, the rest of which consists of interesting essays on Transatlantic pedestrianism, natural history, and pomology, inclusive of the fresh and exhilarating paper which gives its name to the book; but it is plain that his reason of writing is to present to his countrymen his criticisms on the contrasts between our home-ways and those of society in the New World. This he undertakes with a most outspoken frankness, and possibly with an undue bias in our favour. His sympathies are with Old England and its ways and manners. Here we walk for pleasure, health, and exercise. In America we find from essays on "Winter Sunshine," "The Snow Walkers," "Exhilarations of the Road," &c., that no one walks a step farther than he can help, thereby missing the charms of country lanes, fields, and woodlands, at the various seasons of the year. The author goes so far as to surmise that Brother Jonathan might become a humbler and devouter Christian could he persuade himself to walk to church instead of being driven. If in aught he assigns a preference to the New World, it is for the complexion, variety, and richness of its "apple crops"—though the owners can, on his showing, scarcely enjoy the sight of them on the trees—still we are really thankful that he throws in this makeweight to his depreciations of American loudness and smartness. Of the former he says, p. 173, that "the buffers the English have between their cars to break the shock are typical of much one sees there" of life on a lower key and more gentle than in America. As to the latter, he notes, *inter alia*, "that English books and newspapers show more homely veracity, more singleness of purpose—in fact, more character than ours." His comparison of the paintpot renovation of public buildings at Washington with the frequent necessity of whitewash for political reputations is painfully seasonable just now; and he has a sound instinctive preference for English domestic life; but he surely generalises over-much when he lays it down that "all English men wear 'stove-pipe hats,' and that all English women have large feet."

Drury's Double-Entry Book-keeping at a Glance. (Drury.) This little treatise on book-keeping is written carefully, and the subject is as clearly explained as the space the author has allotted to himself—viz. three sides of foolscap—will admit of. Although it will not teach book-keeping to a novice, it will nevertheless suffice to give an insight into the art, if the pupil is determined to follow out Mr. Drury's advice by examining every item of the miniature account given as an example, and carefully bearing in mind Mr. Drury's remarks upon each entry.

NOTES AND NEWS.

HER MAJESTY has graciously sent to Colonel Chester, in recognition of his recent work on the *Registers of Westminster Abbey*, a copy of Mr. Theodore Martin's *Life of the Prince Consort*, with her autograph inscription.

THE death is announced of Dr. Charles Eneberg, Professor of Arabic at the University of Helsingfors. Eneberg had commenced the study of the cuneiform inscriptions of Western Asia, and had left England with Mr. George Smith for the purpose of watching the excavations conducted by Mr. Smith for the trustees of the British Museum. Dr. Eneberg died at Mosul last month; the cause of his death is unknown. He had published an article on the Inscriptions of Tiglath Pileser II. in the *Journal Asiatique*, and also a work on the Arabic pronouns, in 1874.

THE *Nation* announces that a Life of the late General George A. Custer will be published shortly by Messrs. Sheldon and Co. The volume will embrace also his war-memoirs hitherto published in the *Gallery*, together with the last of the series, written and despatched on his fatal march against the Sioux, and as yet unpublished.

BAEDEKER'S *Handbook* to Egypt will be ready in a few months: and the English translation will be commenced at once.

WE understand that Mr. D. R. Fearon, who was for ten years one of H.M.'s inspectors of schools, and is now assistant-commissioner of endowed schools, has nearly ready for publication a small work on *School Inspectors*, which cannot but be interesting to all who concern themselves in popular elementary education. The book is designed to explain the manner in which elementary schools should be inspected and examined so as to secure greater efficiency in their teaching. It will be published by Messrs. Macmillan.

WE understand that the movement within Trinity College, Dublin, to establish some reasonable scheme of retirement for superannuated fellows and professors has hitherto been without results, owing to the resistance of the present senior fellows. The junior fellows are, therefore, about to petition Government for an enquiry into the matter. The compensation given to the college for its advowsons, under the Irish Church Act, affords at present an ample fund for carrying out the scheme of the junior fellows.

EARLY in August a weekly paper is to appear entitled the *Secular Review*, edited exclusively by Mr. G. J. Holyoake. It describes itself as "a new journal of new subjects, testing familiar questions by a new principle: divesting that which is secular from complicity with that which is atheistic, and generally aiming to recast old forms of propagandism in moral, social, and political affairs, which now exhaust earnestness without producing the fruit of advancement."

THE Emperor of the Brazils visited the British Museum on Saturday last, and was conducted through the galleries by the various keepers of departments. He is a distinguished Oriental student, being well read in Hebrew and Arabic, and takes great interest in Assyrian and Egyptian researches. He intends visiting the site of the temple of Diana at Ephesus, the sculptures from which were excavated by Mr. Wood.

MESSRS. PARKER AND CO., of Oxford, have just ready for publication works on the Forum Romanum and the Colosseum, by Mr. J. H. Parker, C.B. Both are profusely illustrated.

DR. SCHLIEMANN has left Troy, as the Pasha there would not allow him to excavate, in spite of the Firman which he had obtained from the Sultan. He intends for the present to carry on excavations at the Treasury of Minyas at Orchomenus, and to explore Tiryns, Mycenae, &c.

THE eleventh *Jahrbuch der Deutschen Shakespeare-Gesellschaft* (Weimar: A. Huschke) contains

hardly as much matter of interest as some of its predecessors. Prof. Delius contributes one of his careful studies on "Shakespeare's *Coriolanus* in its Relation to Plutarch." Herr Krauss traces resemblances between the plot of *A Midsummer Night's Dream* and some incidents in the *Diana* of Montemayor. There is an elaborate paper by Dr. Schulze on "The Growth of the Romeo and Juliet Legend;" and an article by Henze, discussing Shakspere's combination of two or more stories in the construction of his dramas; Herr Thümmel, who last year wrote on "Children in the plays of Shakespeare," now discusses on "Shakespeare's Clowns." Dr. Wagner contributes notes on Marlowe and on *Mucedorus*; the editor (Karl Elze) notes on difficult or doubtful passages in Shakspere. The volume opens with Herr Freih. Vincke's address delivered at the annual meeting of the Society, 1875, on the actor Schröder—born 1744, died 1816—who did much to popularise the Shaksperian drama in Germany. Perhaps the most interesting of the contents is the article by W. König on "Shakespeare and Giordano Bruno." Attention had been called to this subject some years since by Tschischwitz in his study of *Hamlet* (1868) with special reference to that play. Bruno lived in London from 1583 to 1586, and had received the patronage of Leicester, Lord Buckhurst, and Sir P. Sidney; he was known to Spenser and Gabriel Harvey. Setting aside some fancied parallels which an English writer would hardly have adduced, enough still remains to make out a fair case in favour of Herr König's opinion that Shakspere was acquainted with Bruno's writings, and was influenced by his philosophical theories.

WE have received two inaugural exercises for the degree of Dr. at Edinburgh and Erlangen: the first is by the Rev. W. Cunningham, who dates his preface from Trinity College, Cambridge, and is issued by Messrs. Macmillan; the second, by Franz Mark, Cand. Theol., from Csenger Ujfalu, in Hungary, printed by Ratz, of Jena. This is a sensible, and not uncritical, *précis* of Mr. Carlyle's philosophy, which, as may be expected, contains little that will be new to English readers. Mr. Cunningham's treatise on Descartes and English speculation is a model in its kind: it is clear, penetrating, succinct, and trustworthy, and we do not expect an inaugural dissertation to be substantial—it is addressed, in the first instance, to judges who are presumed already to be in possession of the substance of the question; in the second, to students who are in a way to acquire the knowledge the judges possess. It is the proper function of such a dissertation to be a kind of skeleton-key to knowledge. Mr. Cunningham writes from the point of view of those who hold that Kant and Hegel have constructed the final transcendental justification for sound common sense. We notice that in his introduction he does not seem to have used Renan's *Averrhoes* for the sceptical school of Padua. He corrects very happily K. Fischer's attempt to derive all English thinking from Bacon, bringing out the direct relation of Locke and the indirect relation of his successors to Descartes, and doing what can be done without violence to minimise the isolation of Hobbes.

UNDER the title "Old Worcestershire," *Barrow's Journal* publishes from time to time a good deal of curious information respecting the antiquities and past history of the county. Among the most recent contributions to this column is a detailed account (from the pen of Canon Lea) of the foundation and fortunes of the Coventry Hospital, Droitwich. This charity was founded by Henry Coventry, second son of the Lord Keeper, and endowed with certain lands in Droitwich which he had purchased from the famous Loyalist, Sir John Pakington. There is an old tradition that the money with which these lands were purchased "was the result of a race in Westwood Park between a horse of Sir John Pakington and a horse of Mr. Coventry, on which the stakes

were that the loser should found a charity in the name of the winner." The tradition survives in a saying still current among old people that "if all bets were like Sir John Pakington's and Mr. Coventry's bet, there would be no great harm in betting." The charity came into operation in the year 1688, and at first took the form of an endowed workhouse, the inmates of which were widows and children drawn from four parishes. Thirty years afterwards a school for boys was established, but this soon fell into decay, and both it and the industrial home were supplanted by a hospital for aged poor. This was the state of the charity in 1781, when a question arose whether the farms which formed its endowment had been sold in fee to Mr. Coventry, or merely demised for a term of ninety-nine years. To determine this point a suit was commenced in the Court of Chancery, and after a lapse of thirty-one years terminated in a compromise, which was confirmed by Act of Parliament in 1823. By this Act the increased rental of the farms and the accumulated rents and interest were employed in repairing the hospital and adding to it an infirmary ward, and new schools for boys and girls. This scheme has now undergone further revision, and the charity at the present date maintains (upon an income of 1,040*l.*) thirty-six old people and forty boys, and a like number of girls, who are educated and put out in the world.

A CLEVER and splenetic article in the *Edinburgh* on Haydon's Life and Letters, where no opportunity is missed to disparage Leigh Hunt and Keats, contains two original letters from Wordsworth and Scott, written in 1830 to the son of a solicitor, who wished to leave law for literature. Wordsworth told him that he ought to decide for himself, that his letter was fine, and very likely his poems were fine too. In one he (Wordsworth) disliked a line, and did not understand the other. Scott told him not to fret at his circumstances, and that, as a lawyer of forty years' standing, he could not pity him for being brought up to the law. The article on Michel Angelo suggests how much Art lost when artists came to be paid by insolvent princes instead of by solvent communities. A thoroughly admirable article on the Rajput States of India illustrates Sir Henry Maine's theories by the results of Indian observation. According to the writer, the Rajput States still present the very condition of things which Sir Henry Maine divined as primitive, in which the oldest male of the eldest branch is head of the whole family. He is normally controlled by the heads of other branches of the clan, which is never anything like coextensive with the State—e.g., Bikanir has 12,000 Rajputs out of a population of 300,000. Their control is not favourable to strict police, and therefore the writer fears that the English Government may support the titular chiefs in changing their authority into a despotism, tempered by an English Resident, which is what exists in all other Indian States. As it is, whenever the succession has to be carried on by adoption, there arises a curious difficulty. The reigning chief can never afford to name his heir in his life, because the heir would turn into a pretender; consequently the formal adoption has to be executed by the widow. It is her interest and that of the Court and the Ministry to adopt a child and have a long minority, and the English Government seem to think it is more natural to adopt a child than a grown man, which the heads of the other branches of the clan desire in the interest of the State. There is a clear and interesting account, probably based upon Tod, of the history of Rajputana from the Mohammedan Conquest till the establishment of the British Protectorate, which was nowhere more welcome or more indispensable.

THE *Rivista Europea* for July contains the first act of a translation of Longfellow's *Spanish Student*. It notices among new books a volume published to commemorate the battle of Legnano:

Omaggio della Società Storica Lombarda al VII. centenario della Battaglia di Legnano (Milano); to which Cesare Cantù has contributed an elaborate study on the Lombards and Barbarossa. There are, besides, a large number of articles by different writers all bearing on the battle, and the history of the Lombard League. Signor Domenico Berti has brought out a first volume on Galileo: *Il processo originale di Galileo Galilei* (Rome). This is the first time that the true and authentic proceedings at Galileo's trial have been published. Signor Berti introduces the documents with two historical studies illustrating the two trials of Galileo. In a note to a notice on George Sand, the editor of the *Rivista* promises to publish shortly an interesting series of letters written by G. Sand to Mazzini.

MR. ARBER makes sure that he will finish his handsome *Transcript of the Stationers' Registers, 1554-1640 A.D.*, this year. His third quarto is now in the hands of the binders. The fourth volume, completing the work to 1640 A.D., will be ready in October or November; it is well advanced at press. The third volume contains the Book Entries between 1595 and 1620 A.D., a list of all the stationers who took up their freedoms between 1595 and 1640 A.D., and a tabulated history of the master printers of London from 1586 to 1635 A.D. The last-named table will be handy for fixing the limits of date of undated books.

OBITUARY.

AUBERTIN, H., at Paris, July 21. [Author of *L'esprit français au dix-huitième siècle*.]

LÖWENTHAL, J. J., at St. Leonards, July 20, aged 66. Author of *Murphy's Games. The "Era" Problem. Tourney. Book of the Chess Congress, Transactions of the British Chess Association*, &c.

KATE, Sir J. W., at Forest Hill, July 24, aged 62.

THE LATE PROFESSOR SIMROCK.

THE death is announced at Bonn of Karl Simrock, the well-known poet and scholar. He was born in 1804 at Bonn, where his father had founded a large musical publishing firm. He studied jurisprudence at Bonn and Berlin, and in 1823 entered the public service as *auscultator*. His leisure hours were devoted to the study of Old German philology and literature, then lately revived by the works of the brothers Grimm, Lachmann, and others. He also became known as a translator, and as an original poet of considerable merit. The French Revolution of 1830 inspired him with a song, the liberal tendency of which was the cause of his dismissal from the Government service. From that time he wholly devoted himself to his favourite pursuits of poetry and philology. In 1850 he obtained the Chair of Old German literature in the University of Bonn, which he occupied till his death. As a public teacher he was wanting in rhetorical power, but his lectures were always full of interest and thorough scholarship. The advice and instruction kindly given by him in private intercourse with his pupils, and the genial hospitality of his family circle, will live in the memory of many students of the university.

As a poet, Simrock was the leader of a group of gifted writers generally known as the "Rhenish School," of which he and Wolfgang Müller, of Königswinter, were the best known members, and of which Alexander Kaufmann is the sole surviving representative. Simrock's *Gedichte* (first collected in 1844) do not lay claim to great depth of feeling or dramatic pathos, but they are imbued with the poet's love of his country, and its beautiful river. Old German traditions, and especially the popular stories and songs of the Rhineland, are also an important element in Simrock's poetry. Of the latter stories, either in their original form or in modern versions by himself and other poets, Simrock published a collection entitled *Rheinsagen*, which has become deservedly popular. Of

Simrock's own poems, the beautiful song beginning:—

"An den Rhein, an den Rhein, zieh nicht an den Rhein,
Mein Sohn, ich rathe dir gut,"

has become a *Volkstied* in the fullest sense of the word. Simrock was still more remarkable as a translator than as an original poet. His attempts at metrical reproduction are exceedingly numerous, and extend over the whole range of old Teutonic literature from the "Edda," "Beowulf," and the old High-German "Heliand," down to the "Heldenbuch," "Gudrun," and other productions of the later Mediaeval period. His first, and perhaps his best, translation was that of the *Nibelungenlied* (1827), the seventeenth edition of which was published about ten years ago. This book is among the few reproductive works which occupy a permanent place in literature. It ranks with Chapman's Homer and Delille's *Aeneid*. Simrock's *Nibelungenlied* has, at the same time, largely contributed in spreading the interest in Mediaeval literature among the German public.

As a scholar, Simrock belongs essentially to the school of Lachmann. But, unlike so many of the disciples of that great philologist, he never forgot the spirit over the letter. Among his scientific books may be mentioned the excellent work of reference, *Handbuch der Deutschen Mythologie*, and his treatise on the *Nibelungenstrophe*.

F. HUEFFER.

NOTES OF TRAVEL.

THE Committee of the Palestine Exploration Fund have made an arrangement with Mr. Stanford for the publication of the great map of Palestine. He will issue it in a double form. The first will be the reproduction of the Survey in twenty-six sheets, on the scale as drawn of one mile to the inch. This will be lithographed in the best style. The second will be a smaller map, on the scale of three miles to the inch, which will be engraved on copper. Memoirs on special subjects connected with the Survey will also eventually be published from the notes of Lieutenant Conder. It is hoped to despatch the party to finish the Survey at the end of the year. In the same *Quarterly Statement* from which this intelligence is drawn, Lieutenant Conder continues his identifications of names. He remarks that "they are, as a rule, found in consulting Geesenius for the derivation of the names which are not to be found in an Arabic dictionary." In a future paper he will discuss the position of Emmaus, with several other sites of interest.

RECENT numbers of the *Revue Critique* have contained some correspondence on the subject of the Batuecas. An early account of the myth relating to their discovery is given by James Howell, Clerk to the Council under Charles I., in his *Instructions for Forreine Travell*, the first edition of which appeared in 1642. We quote from Arber's reprint (p. 51):—

"And now for further proofs that the *Cantabrian* language is the ancientest of *Spaine*, I thinke it will not be much from the purpose, if I insert here a strange discovery that was made not much above *halfe a hundred yeares ago*, about the very middle of *Spaine*, of the *Pattuecos*, a people that were never knowne upon the face of the Earth before, though *Spaine* hath been a renown'd famous Countrey visited and known by many warlik Nations. They were discovered by the flight of a Faulcon, for the *Duke of Alva* hauking on a time neere certaine hils, not far from *Salamanca*, one of his Hawks which he much valued, flew over those Mountaines, and his men not being able to find her at first, they were sent back by the Duke after her; these Faulknrs clammering up and down, from hill to hill and luring all along, they lighted at last upon a large pleasant Valley, where they spied a company of naked Savage people, locked in between an assembly of huge crags and hils indented and hemmed in (as it were) one in another: As simple and Savage they were, as the rudest people of any of

the two *Indies*, whereof some thought a man on horse-back to be one creature with the horse: These Savages gazing awhile upon them, flew away at last into their caves, for they were *Troglodites*, and had no dwelling but in the hollows of the rocks: The Faulconers observing well the track of the passage, returned the next day, and told the Duke that in lieu of a baube, they had found out a New World, a New People never knowne on the continent of *Spaine* since *Tubu Cain* came first thither: A while after, the Duke of *Alva* went himself with a company of Musceteers, and Conquered them, for they had no offensive weapon but slings; they were *Pythagoreans*, and did eat nothing that had life in it, but excellent fruits, rootes and springs there were amongst them; they worshipped the Sun, and new Moone, their language was not intelligible by any, yet many of their simple words were pure *Basculence*, and their guttural pronunciation the very same, and a guttural pronunciation is an infallible badge of an ancient language; And so they were reduced to Christianity, but are to this day discernable from other *Spaniards* by their more tawny complexions, which proceeds from the reverberation of the Sun-beams glancing upon those stony mountaines wherewith they are encircled, and on some sides trebly fenced, which beames reflects upon them with a greater strength and so tannes them."

THE Rumanian Geographical Society, which was founded at Bukharest, in June 1876, has newly issued the first volume of its journal, the *Buletinul Societatii Geografice Romane*, each Romanic paper being accompanied by a French translation. Agreeably to the intention of the society, as expressed in its constitution, to promote geography in the Principalities, and to make them better known outside their borders, the greater part of this first publication is given to an exhaustive essay on the geography, finances, administration, religion, commerce, and industries of the country, by Emanuel Cretzulesco; this is accompanied by a large and beautifully-executed map of Rumania and the lands adjoining the Danube, from Pesth to Odessa, by I. V. Masseloup.

SEÑOR AIMÉ PRISIS, the chief of the Topographical Staff in Chile, who, since 1849, has been engaged in the great work of surveying and mapping that country, has just published (Paris: Delagrave et Cie.) a small volume on the Physical Geography of the Republic, with an atlas of plates and diagrams. So admirably is this region adapted by nature for the illustration of every part of physical geography that even the short description before us of its orography, geology, meteorology, and hydrography, and of the distribution of animals and plants within it, by one who has such intimate acquaintance with the land, could not fail to be of very high original value; yet we could have wished to see each of these subjects treated more in detail in connexion with a country in which physical laws and changes attain their most magnificent scale of operation.

A CLUB was organised in the beginning of the present year for the systematic examination of the mountains of New England, dividing its labours under the departments of Exploration, Natural History, and Topography, and purposing to publish the results of their researches from time to time. The first number of *Appalachia*, the journal of this club, now appears, and testifies to the activity of the members in a number of interesting reports and essays, among which are papers by Prof. C. H. Hitchcock and L. F. de Pourtales. A committee of the club has done good preliminary work in completing a systematic division of the groups of the White Mountains and an enumeration of the summits, the nomenclature of which was formerly in a very confused state, the same name being frequently applied to several mountains.

A MOST important contribution to physical geography has been made in an essay on "The Action of the Winds in determining the Form of the Earth," by Dr. Franz Czerny, member of the Imperial Geographical Society of Vienna, which

is published as the forty-eighth supplementary number of *Petermann's Mittheilungen*. The work is divided into three parts, treating, first, of the climatic or meteorological action of the winds, as in their distribution of moisture, effect on the height of the snow-line and of glaciers, and in bringing about the variations of surface-covering in deserts, steppes or forests; second, of the mechanically-produced effects of the winds on land, as in the formation of dunes, and on water, in the production of drift currents and waves. Lastly, the actions which are partly mechanical and partly climatic are discussed. The work displays a vast amount of research and a close acquaintance with every modern authority, and may be said to summarise the whole of our present knowledge of this interesting subject.

THE sixth report of the work done by H.M.S. *Challenger*, containing a summary of her ocean soundings, and observations of temperature in the North and South Pacific, just issued by the Admiralty, adds very largely to the store of trustworthy material for the investigation of the movements of the ocean waters, in no less than six temperature sections across different parts of this great basin. Everywhere these appear to confirm the law of interchange of polar and tropical waters in a great cold underflow towards the equator. Attention is specially drawn to the peculiarities of the isotherm of 36° in the two last sections of the South Pacific, which seem to follow very nearly the contour of the sea bed, but not exactly so. In the section east and west the highest point of this isotherm is not exactly over the shoalest soundings, but is a little west of them; and in the section south from Tahiti its highest point is slightly north of the shoalest sounding.

A JOURNEY TO VIENNA WITH LORD PETERBOROUGH.

ONE of the best-remembered character-sketches in Macaulay's *Essays* is, perhaps, that of the famous fighting Earl of Peterborough, the last of the knights errant; of whom it was said, from the rapidity with which he carried out his many diplomatic missions, that he had seen more crowned heads and postilions than any other man of his time. An interesting original memoir kept by Simon Clement, a gentleman attached to Lord Peterborough when engaged on one of these missions, has recently come into the possession of the British Museum, and is now preserved in the Manuscript Department. This curious little volume is entitled *A Journal of what I found remarkable in my travelling with My Lord Peterborough to Vienna*, and begins with an entry dated Saturday, January 13, 1710, on which day they sailed from Greenwich "about 5 of y^e clock in the afternoon in the *Catherin* Yacht, Capt. Monk commander," for Rotterdam. In his journey across country to Vienna our traveller gives very full descriptions of the different places through which they passed, much too long for quotation here. We note, however, a few of his most striking observations. At Delft lived many of the gentry of Holland, and there was a kind of hospital (not to call it a prison) wherein gentlemen, though of the highest quality, were confined, upon complaint of wife, children, or nearest relations that they wasted their estates by extravagance or ill-management—so far did the Government concern itself for the preservation of family estates. The Hague the Dutch affected to call the biggest village in Europe, being totally without fortifications, though in Clement's opinion it deserved to be ranked with the second order of cities for its largeness. Amsterdam is justly, he thinks, accounted the richest trading city in the world, but the inhabitants of it are so parsimonious of room in their houses, that even in the best they make the stairs so steep and narrow that if a man make

one false step in descending he must expect to fall to the bottom. Indeed, such an air of parsimony may be discerned in all the managements of this nation, even in their indulgences; and the great figure this State makes in the world, and the great power it is able to exert, are entirely owing to the frugality of every degree of the people, whereby they are enabled to bear the burden of the vast taxes laid upon them. On February 3, Lord Peterborough and he left the Hague "with a Berlin (a kinde of coach) a chais and a Baggage-waggon at 9 a clock in y^e night by Moon-shine," passed through Utrecht, "a fine City and University in a pleasant country," and entered the King of Prussia's territory, the Duchy of Cleves, on the 6th. From Wesel they got to Düsseldorf, the residence of the Elector Palatine, but it being Carnival-time there my lord could get no lodgings at the "public houses," and had to be entertained, by the Elector's directions, at the house of Count Frosini. Everything at this Court appeared in great decency and order, and afforded such a specimen of princely magnificence as that of greater sovereigns might be said to exceed rather in quantity than in quality. After a splendid entertainment they were carried to the Opera, where his lordship sat with their highnesses, and they of the retinue were placed in a convenient gallery and plentifully served with wine and other refreshments. The performance was in great perfection. By two the following morning they were on the road to Frankfort, which they reached in three days, a city "well fortified, rich, and Lutheran." Here they lay at a famous inn called the Red House, fit for a nobleman, but very dear. Four days later they arrived at Nuremberg, where the principal gentry paid most marked attentions to the ambassador, and their master of the ceremonies was sent with a present of live fish and above thirty flagons of curious wines. My lord, however, not having convenience of carriage, left them behind, but gave very generously to the servants and poor. From thence by Ratibon and Straubingen to Passau, where they took boat. Of Lintz Clement says it has more stately large houses than he had ever before seen in so little compass. Here they were entertained with the sight of many curiosities of art and nature, among the rest a machine like clockwork, taking its first motion from a horizontal wheel made of cards held together by a circumference of paper, which was turned round by the smoke of two small wax candles conveyed to it through two "latin funnels" placed under, and by a four-fold pulley it drew up a stone of half a hundredweight. It being Lent they were served with a most magnificent fish dinner, fried, boiled, and baked, the most remarkable fish supplied being a carp two feet long in a pie, and roasted fresh oysters in the shell. These curiosities and this dinner were met with at the Jesuits' College in Lintz, and Clement records with satisfaction that the Fathers were not sparing of their wine, and could not have shown more respect and civility to a prince than they did to Lord Peterborough. My lord in return was very liberal to them, leaving behind twenty pistoles for the poor, and presenting the Father Rector with a repeating gold watch, worth fifty pounds. From this place Vienna was reached, partly by road and partly by water, in four days; at which point the narrative abruptly closes.

SECRET SERVICE MONEY UNDER GEORGE I.

FROM a manuscript volume of "Revenue Returns," originally, no doubt, belonging to the Treasury, but which passed in recent years from the hands of a private person into the British Museum, we get a few instructive illustrations of how the money went *temp.* George I. Under the head of "Secret Service," between the dates March 25, 1721, and March 25, 1725, we note the following entries:—
"To William Lowndes Esq. . 243,200l.

To John Scrope Esq.	89,900l.
To Charles Lord Visct. Townshend one of his Maties Principal Secretaries of State	11,650l.
To John Duke of Roxburgh another	13,500l.
To John Lord Cartaret late another	9,240l. 3s. 6d.
To Thomas Holles Duke of Newcastle another	2,175l. 16s. 5½d.
To James Earl Stanhope late another	1,850l.
To Robert Walpole Esq. late another	1,771l. 19s. 6d.
To Wm. Stanhope Esq. ambassador Extra ^r to the Catholick King	6,000l.
Making a grand total for the four years of	379,296l. 19s. 5½d.

Passing by a long account of payments to ambassadors and foreign Ministers between the same dates, we next come to a list of "Gifts, Rewards, Bounties, and Extraordinaries of divers Natures," which includes the following noteworthy items, besides numerous entries of money paid for the capture of highwaymen, "smuglers," &c.:—

"To Geo. Bamfield Esq. for providing Goods as a present to the Indians of New York	835l.
To Henry Lord Herbert in lieu of a Jewell which his Majesty meant to present him	500l.
To Phillip Dormer Stanhope Esq. comonly called L ^d Stanhope, ditto	500l.
To Dr James Douglas, for his performance and publishing his Anatomical Observations.	500l."

Douglas was a famous London practitioner, born in Scotland, 1675; noted also for a curious library of editions and translations of Horace, which passed into the hands of the Chevalier d'Eon.

"To Dr Thos. Renton for making known his Art Skill & Mistery in curing of Ruptures &c.	5,000l.
To Arthur Collins, as of Royal Bounty.	200l."

Another entry of payment of the like amount to this person, who was doubtless the compiler of the well-known *Peerage*, &c.

"To Charles Maitland Surgeon for Inoculating Prince Frederick for the Small Pox	1,000l.
To Gideon Harvey Dr in Physick Physician at the Tower for visiting the State Prisoners	300l."

Harvey was appointed to the Tower about 1689, and is said to have been physician there fifty years. He wrote a singular work, called *The Conclave of Physicians: detecting their intrigues, frauds, and plots against their patients*.

"To Jacob Tonson Stationer for printing the Inventories of the Estates of the late Directors of the South Sea Company	1,716l. 8s. 1½d.
To Sir Joseph Eyles Knt. for the Young Princesses	79,000l.
To Wm Richards G ^t for the charge of 15 persons who voluntarily went into the service of the King of Prussias Granadiers from Ireland to Berlin	221l. 5s."

We get here a glimpse of the hobby of the Great Drill-Sergeant, Frederick William, father of Frederick II. An Irishman, James Kirkman, it will be remembered, was one of the finest grenadiers in that famous army of giants; but he could hardly have been one of this batch, for history records that the king spent 200l. on him alone, for expenses in watching, guarding, and forwarding him to Berlin, after having given him 1,000l. to secure his service.

"To Wm Pitt Keeper of Newgate for Expenses &c, for the Rebels taken at Preston	700l.
--	-------

To Chris ^r Tilson Esq ^r and other Managers of the Lottery 1722 for their service	7,250l.
To Gabriel Bourdon Merch ^t for 26 Bustos with Marble Pedestals for his Maty	600l.
To John Anthony Balaguier Esq ^r for expences in bringing over the Bustos for his Matie	163l. 3s. 8d.
To Robt. Saunderson Esq ^r for making 3 Add volumes to Rhymers Phedra	700l."

CORRESPONDENCE.

ELAMITE ANTIQUITIES.

British Museum: July 24, 1876.

The discovery and decipherment of the cuneiform inscriptions of Babylonia and Assyria have been productive of great results, not only in the development of a full contemporaneous history of their own, but in the great light they have thrown on the history and affairs relating to the nations bordering on the lands of Assyria and Babylonia.

At a very early period the inscriptions point to the existence of a very powerful collection of tribes, akin to the Accadian population of Babylonia, having formed a kingdom on the east bank of the Tigris. This kingdom is called *Numma*, or the "highlands," in the Accadian inscriptions, and *Elamu* in the records of Assyrian kings. This is evidently the Elam or 𐎶𐎵 of Genesis, x. 22, here stated to be of the seed of Shem. This statement is not supported by the inscriptions.

The Accadians, who spoke an agglutinative tongue, and whose language is akin to that of the Elamites both in point of words and in the mode of writing, are certainly to be identified with the Cushite population who founded the Babylonian empire of Nimrod, and they with the Elamites are the Eastern Ethiopians of the Greek writers.

The monuments represent both the people of Babylonia and the Elamites as quite distinct in feature and figure from the Semitic Assyrians; they are always represented with lank straight hair.

Herodotus, in speaking of the Ethiopians, says:—"The Eastern Ethiopians of Asia are dis-

tinguished from the Western of Africa by the straight hair of the former, and the curly hair of the latter." * Homer also speaks of the Ethiopians "as being divided into two parts, the most distant of men, some at the setting of the sun, some at the rising." †

The history of Babylonia abounds in border wars between these two branches of the Cushite people, and in about the nineteenth century before the Christian era the Elamites overthrew the Semitic dynasty of Sargon and placed a line of kings of their own on the throne under Kurdu-Mabug. This monarch is evidently to be identified with the Chedorlaomer of Genesis xiv. 1; his son Ari-acu was ruler of Larsa, the Biblical Ellasar, and is therefore clearly the 𐎶𐎵 of the Hebrew text. The other two monarchs, Amraphel and Tidel, or, as the LXX gives, Thargal, are clearly early Babylonian non-Semitic names.

It was on the overthrow of the Semitic line of Sargon of Agane that the migration of Abraham took place. This Elamite dynasty remained in power for some time, and at last gave place to the Kassite line of Khammu-ragas, a most important king in Babylonian history, whose reign commenced about 1600 B.C.

During the whole period of the Assyrian empire, the kingdom of Elam was constantly making border raids, and the Assyrians also invading Elam, but during the late dynasty of Sargon of Khorsabad the wars became more and more frequent, until at last the Elamite king Umman-aldas was defeated by Assurbanipal in B.C. 642, and his capital, Susa, spoiled and destroyed.

Such is a brief outline of the relations of Elam with Babylonia and Assyria, but as yet our information is mostly derived from either Assyrian or Babylonian texts, owing to the scarcity and difficulty of the Elamite legends.

The explorations conducted by Mr. Loftus on the ruins of Susa brought to light many important remains of the ancient city, inscriptions, and sculptures. Copies of these texts, with carefully-executed drawings of the site and ruins, have been deposited in the British Museum, but a fresh acquisition to our material for the study of Elamite history has just been made. Colonel Ross, the English political Resident at Bushire, has presented to the trustees of the British Museum a small but important collection of antiquities obtained on the east of the Tigris.

The collection consists of a number of bricks inscribed with legends of the kings of Susa. The finest of these are those of a monarch named *Tar-kha-ak*, or, as M. Lenormant reads, *Sel-kha-ak*, but the former appears to me the more likely reading.

This monarch calls himself *Anin Susnak*, King of the Susanians, "the powerful ruler, the princely King of the Susanians." These bricks differ in many points from the Babylonian. They are of a much finer material, and of a more carefully proportioned form, the dimensions being 13 x 6½ x 3½—the inscriptions being written on the edge in six or seven lines, and in characters a little less archaic than those of Babylonian bricks. This monarch, *Tar-kha-ak*, whose name so closely resembles that of the Egyptian king *Tirhakah*, was the son of Kudur Nakhunte II., and was contemporary with Tiglathpileser II., or Shalmanesar, B.C. 700. Some other bricks in the collection are those of Kudur Nakhunte, and of Urtaki, a monarch who opposed Esarhaddon in the latter part of his reign.

There is in the collection a curious stone coffin. This object is very valuable, as, with the exception of the coffins of the Parthian period brought by Mr. Loftus from Warka, it is the only funeral object from Western Asia.

The coffin is composed of a white calcareous stone of a softer grain than that used in the sculpture, with a lid of alabaster. Its dimensions are—length, 1 ft. 6 in. (the end is semicircular); breadth, 13 in.; height, 10½ in.; the thickness of

* Book VII. 69-70.

† *Odyssey*, I. 22.

the sides and bottom is uniform, 1½ in. No bones were found in the coffin, which was probably that of a child.

Another object is a sepulchral vase, which is one of the most important objects in the collection. This vase, which is of a peculiar shape, is full of human bones in a very fair state of preservation. These remains appear to have been subjected to the action of fire, but not to a great extent. Vases containing human remains were found by Mr. Loftus on the Great Mound of Susa in the vicinity of Parthian and Sassanian relics. Mr. Loftus says of these vases:—

"There were several cylindrical jars, three or four feet in length, containing the bodies of children; but, as the cranium was generally larger than the neck, it is difficult to conceive how it could have been placed inside. The most feasible explanation is that the jars were moulded round the skeleton, and then baked with the body inside, numerous small holes being apparently made for the escape of the gases generated during the process" (*Chaldea*, p. 405).

In the vase presented by Col. Ross there are no indications that would point to the moulding of the vase round the skeleton, as there are no internal indentations such as would be made in pressing the soft clay against the bones; neither are there any holes for the escape of the gases. I should therefore conclude that the vase is of a different period from those found by Mr. Loftus in his excavations. The number of bones contained in the vase would appear to indicate that it contained the remains of more than one person.

In none of the Assyrian or Babylonian inscriptions yet found is there any indication of the mode employed by this people for the disposal of dead bodies; it is, therefore, very interesting to meet with any objects which may throw light on the customs practised by any of the inhabitants of Western Asia.

W. ST. C. BOSCAWEN.

THE "PHILOSOPHERS' CLUB" IN "DANIEL DERONDA."

St. John's College, Cambridge: July 20, 1876.

May I call the attention of your readers to a fact in connexion with the current (VI.) number of *Daniel Deronda* which seems to have escaped the eyes of the reviewers? It is that the interesting episode of the "Philosophers' Club," which may have appeared to some artificial or improbable, is, in fact, a faithful transcript from real life; and that Mordecai is perhaps but a slightly idealised portrait of a real Cohen.

In the *Fortnightly Review* for April 1, 1866, the editor, Mr. George Henry Lewes, prefaces a fascinating article on Spinoza by an account of a small club of students who were wont to meet, thirty years before, at a tavern in Red Lion Square, Holborn. The members were the keeper of a second-hand bookstall rich in freethinking literature, a journeyman watchmaker, a bootmaker; another lived on a moderate income; another "penned a stanza when he should engross," and so on.

"Seated round the fire, drinking coffee, grog, or ale, without chairman or president, without fixed form of debate, and with a general tendency to talk all at once when the discussion grew animated, these philosophers did really strike out sparks which illuminated each other's minds; they permitted no displays of rhetoric such as generally make debating societies intolerable; they came for philosophic talk, and they talked."

Two members are singled out "as remarkable specimens of the varieties which the club comprised":—

"One of these was Mr. James Pierrepont Greaves—a name which carries with it a certain mystical halo in some American and English circles. . . . In striking contrast to this excellent man was a German Jew, named Cohn or Kohn, whom we all admired as a man of astonishing subtlety and logical force, no less than of sweet personal worth. . . . A calm, meditative, amiable man, by trade a journeyman watchmaker, very poor, with weak eyes and chest; grave

and gentle in demeanour; incorruptible, even by the seductions of vanity. . . . I loved his weak eyes and low voice; I venerated his great calm intellect. . . . Life was hard to him, as to all of us; but he was content to earn a miserable pittance by handicraft, and keep his soul serene. . . . Cohn, as may be supposed, early established his supremacy in our club. A magisterial intellect always makes itself felt. Even those who differed from him most widely paid involuntary homage to his power."

This little discovery, first made by a fellow-student, may be valued by some who find a novel invested with increased interest when they know it is "founded on fact." Nor is it without instruction to those who affect the study of the mechanism of literary creation.

DONALD MCALISTER.

MICHEL ANGELO BIBLIOGRAPHY.

16 New Burlington Street, W.: July 24, 1876.

In the list of works published on the occasion of the Michel Angelo festival of last year which appears in the *ACADEMY* of the 15th inst., I do not observe any mention of a paper read by Mr. C. Drury Fortnum, F.S.A., at a meeting of the Archaeological Institute, and published in vol. xxxii. of the *Archaeological Journal*, entitled "On the Original Portrait of Michel Angelo by Leo Leone, 'Il Cavaliere Aretino.'" This is the more remarkable as the memoir is referred to in the Cavaliere Luigi Passerini's octavo volume entitled *La Bibliografia di Michel Angelo Buonarroti* (Firenze, 1875, p. 53), an important work also omitted from Mr. Heath Wilson's list. In the forthcoming number of the *Archaeological Journal* another contribution by Mr. Fortnum will appear, on the subject of the bronze portrait-busts of Michel Angelo attributed to Daniele da Volterra and others, with further observations on portraits of the great master.

JOSEPH BURTT.

SCIENCE.

Patrum Apostolicorum Opera. Recensuerunt Oscar de Gebhardt, Adolphus Harnack, Theodorus Zahn. Editio post Dresselianam alteram tertia. Fasciculus I. (Lipsiæ: J. C. Hinrichs, 1875.)

THIS new edition of the Apostolic Fathers deserves and will receive a hearty welcome from all students of early patristic literature. Though respect for a veteran labourer in this field has led the editors to retain the name of Dressel on their title-page, the present edition is from beginning to end a new work. The first fasciculus contains the Epistle of Barnabas and the two Epistles of Clement of Rome, together with the fragments of Papias and of the Elders quoted by Irenæus, and the letter to Diognetus. It is the joint work of the two first mentioned of the three editors, the labour being divided in such a way that Gebhardt is responsible for the text and *apparatus criticus*, together with those portions of the prolegomena which relate to the manuscripts and editions, while Harnack has written the exegetical notes and the remaining sections of the prolegomena treating of the date, authorship, and reception of the several works. The second fasciculus will contain Ignatius and Polycarp, and will be edited by Zahn, who has given proof of his competence for such a task in his monograph *Ignatius von Antiochien*. The third and last will give the *Shepherd of Hermas* under the same twofold editorship and with the same division of labour as the first.

The editors of the first fasciculus may be congratulated on the execution of their task. When completed, this work promises to be quite the most convenient as well as the most thorough edition of the Apostolic Fathers which has yet appeared. The prolegomena are full and well arranged; the literature is given with a completeness which is almost exhaustive; the text is carefully and soberly constructed; the *apparatus criticus* omits nothing of importance; and the exegetical notes, though they suffer somewhat from too great compactness, furnish much useful matter, both in illustration of the language and in references to authorities treating of the subject-matter. Not the least pleasing feature in this work is the generous appreciation which the editors show of the labours of their predecessors.

Having thus recognised the general excellence of this work, I shall venture with less hesitation to criticise some points in which the conclusions of the learned editors seem to be at fault.

It is necessarily in those parts of the prolegomena which treat of date, authorship, and the like, that the greatest room for difference of opinion will be found. In the view which Harnack maintains respecting the date of the so-called Epistle of Barnabas, for instance, he is led astray, as I venture to think, by a false interpretation of the sixteenth chapter which has vitiated the great mass of recent speculation on this point. The writer of the letter is here maintaining that the true temple was not the material edifice, as the Jews vainly supposed, but the heart of man in which God enshrines himself. Accordingly he quotes Isaiah lxvi. 1, "What house will ye build for me?" to show that their hope in the material temple was vain. This is followed by another passage from the same prophet (xlix. 17), "Behold, they that destroyed this temple shall themselves build it up;" on which the writer remarks, "This is in course of fulfilment (*γίverαι*); for, because they went to war, it was destroyed by the enemies; and now the subordinates of the enemies will themselves build it up."* This is supposed to refer to the hopes which Hadrian held out to the Jews that he would rebuild the temple, and therefore to fix approximately the date of the epistle at about A.D. 120. But, as a matter of fact, there is no trustworthy evidence of any such intention. And even if it were otherwise, this interpretation altogether militates against the context. In the first place, the prophecy so interpreted would be fatal to the author's argument, and would never have been introduced to be thus explained. He is giving reasons why the Jews were wrong in trusting to the material temple: whereas this fulfilment would furnish them with the very strongest argument in their favour. In the next place the author immediately afterwards, quoting

* In this passage, *οὐκ οὐρανοῦ* [καὶ] οὐκ ἐκ χειρὸς ἀνθρώπων, the second *καὶ* is retained by the editors with *et*, but should, I think, be omitted with the other Greek MSS. and the Latin version. The re-erection by the Jews themselves would be no fulfilment of the prophecy, which speaks of the same persons who destroyed it as rebuilding it. But this does not seriously affect the point at issue.

another prophecy which contains a promise of the rebuilding of the temple, explains that this refers to the indwelling of God in men's hearts, whereby they are created anew in Christ. There is no indication here that the writer was thinking of two different kinds of rebuilding, a material and a spiritual erection, in the two passages, though the exigencies of his interpretation have introduced some confusion into his language and thoughts. For these reasons we are forced to side with Hilgenfeld and others whom Harnack describes as "misere locum illum vexantes" (p. xlii.), and interpret the rebuilding spiritually. The "subordinates of the enemies" will therefore be the Gentile converts to the Gospel, the subjects, and in some cases the soldiers, and even the courtiers, of the Roman emperors who had destroyed the material temple. The allusion, so interpreted, no longer clashes with an earlier passage, in the fourth chapter, where the writer quotes the prophecy of the ten kings and the little horn in Daniel. His application of this prophecy to his own times suggests a date under the Flavian dynasty at the latest for the publication of the Epistle, and cannot without extreme violence of interpretation be referred to the reign of Hadrian.

The views adopted with regard to the date and reception of Clement's genuine epistle are sober and just. In common with the great majority of recent critics, Dr. Harnack assigns it to the reign of Domitian (about A.D. 93-97); and the convergence of opinion towards this view is now so great that it may almost be regarded as a settled point. With one exception, his conclusions regarding the author also commend themselves to the sober judgment; but when he considers it "very likely" (p. lxxxviii.) that the author of the epistle was the Consul Flavius Clemens, the cousin of Domitian, who was put to death by the emperor for his profession of Christianity, it is necessary to part company with him. The style and contents of the letter are altogether unlike what we should expect from a genuine Roman of high rank, whose profession of Christianity can hardly have been made before mature or even middle life. The intimate familiarity with the Old Testament, the acquaintance with traditional interpretations and legends of the Jews, and the whole colouring of the Epistle, seem adverse to this supposition.* Moreover, it seems altogether unlikely that, if the chief pastor of the Roman Church had been also the nearest male relative of the reigning emperor, the fact would have been ignored in Christian records. On the other hand, some connexion between the writer and the Flavian house is suggested by the name. If we may indulge in an hypothesis, our Clement was a Hellenist Jew, a freedman in the service of the Emperor's cousin; and in this case he would probably be a main instrument in the conversion of his patron to Christianity. I have pointed out elsewhere (*Contemporary Review*, May 1875, p. 831) that we have in the inscriptions evidence of one Jew at least bearing the name of

Clemens in the Flavian household (Orelli, *Inscr.* 2,899). Recent interesting discoveries of De Rossi have furnished additional testimony to the spread of Christianity in the Flavian family and their adherents (*Bullettino di Archeologia Cristiana*, 1875).

As regards the so-called Second Epistle, Dr. Harnack has somewhat hastily accepted the conclusion of Hilgenfeld that this is the letter of Bishop Soter to the Corinthians, expressing his surprise at the same time that "no one before Hilgenfeld had discovered the truth;" though the character of the document itself, even in its mutilated state, suggested the most serious objections to this theory. The recent publication of Bryennios, where it appears for the first time complete, shows beyond a doubt that it was not an epistle, but a homily read in a Christian assembly; but the authorship still remains as obscure as before.

The mention of this recent discovery leads us naturally to speak of the text. Never perhaps has conjectural criticism been exercised on so extensive a scale as in filling the lacunae of these epistles in the Alexandrian MS.; and never certainly has it been so severely tested as by this discovery, which places the actual readings before our eyes. The result on the whole is very satisfactory. The surprise of readers will be, not that in a few instances critics have failed to divine the reading, but that in the vast majority of cases their divination has proved true. The later editors have of course the advantage over the earlier; and Gebhardt may well be congratulated on the sober judgment which has led him so commonly to correct results. This will be no slight compensation for the untoward fact that his edition appeared within a few months of the time when a twofold discovery—first, of an entire Greek MS., and secondly of a complete Syriac translation* of Clement—has substituted certainty for conjecture, and placed the criticism of the text on a new basis.

Of Harnack's notes, and of his prolegomena, it is a sufficient recommendation to say that they show that extensive mastery of the literature of the subject, foreign as well as German, of which the writer has given evidence in a still later article on recent works upon early Church History, in the new *Zeitschrift für Kirchengeschichte*, I. p. 111, sq.

In a work comprising so many details, it is impossible that all errors should be avoided. There is no respectable authority, I imagine, for declining "Apollon" as if "Apollo," and writing "Apollinism" as the accusative case (as is done twice on p. 140). The Vulgate at all events does not countenance this solecism. On p. 85 *Ἀριάντες* is mentioned as a conjecture of Holtzmann for *Δαναίδες*. I have no opportunity of verifying the statement, but if Holtzmann is really guilty of such a barbarism, it ought not to have been mentioned without a remark. On p. 105 "Polyc. ad Phil. 6" appears as a reference, though the writer quoted gives it correctly *Ign. ad Polyc. 6*. On p. 182, annotating on the passage of Papias quoted by Irenaeus, *et in uno vero palmite*, Harnack has been led astray by Mr. Harvey. To explain *vero* Mr.

Harvey supposes that the story was originally told in Syriac, and that we have here a confusion between "sherira," true, and "sherura," a tender shoot; and Harnack has some speculations built upon this hypothesis of a Syriac original. The fact is that *vero* is not the adjective, which would be quite out of place, but the conjunction, so that *et . . . vero* represents *καὶ . . . ἔτι*, as elsewhere in this same translation of Irenaeus, iii. 2. 2, "*et se vero indubitate*," etc. On p. 195 *κατ' ἐκεῖνο καιροῦ* should be read for *κατ' ἐκείνου καιροῦ*, which can hardly stand; while in the next line *ἐπισκόπῳ* is a very violent emendation of *εὐβιάτῳ*, and moreover produces an awkward order. Should we not read *συνβιάτῳ* or *συνβιωτῇ*, "companion," the confusion of *ευ-* and *συ-* being easy? The word *συνβιωτής* is not uncommon; and even the form in *-ος* is found (Eupolis, Meineke, *Fragm. Com.* ii., p. 497), though probably corrupt. On p. 190 it is difficult to see why the editor should have questioned *τοῦ πάνυ* and recorded Zahn's conjecture *τοῦ παναγίου*, when *ὁ πάνυ*, "the great one," is a recognised Greek idiom, and this same Anastasius elsewhere designates Papias by an equivalent, *ὁ πολὺς*. But these are only small blots on the general excellence of a work which will be appreciated by none more heartily than by those who have laboured in the same field.

J. B. LIGHTFOOT.

CURRENT SCIENTIFIC LITERATURE.

Magnetism and Electricity. By Frederick Guthrie, F.R.S. (London and Glasgow: William Collins.) This long-expected book fully justifies the reputation of the author as a singularly lucid lecturer and an ingenious and original experimenter. The work contains, in a popular form, an account of all the principal phenomena of magnetism and electricity, and may be regarded as the enlarged and illustrated lecture-notes of the course of lectures which Dr. Guthrie is in the habit of giving every year at South Kensington. One great merit of the book is, therefore, that the experiments which it discusses have all been tried by the author, and the minute descriptions of apparatus will be of great use to the student. We must, indeed, offer some slight objection to the style, which sometimes in aiming at simplicity becomes inelegant (for example, par. 43 p. 41); and is sometimes altogether obscure (for example, par. 14 p. 17). The work is divided into three books, the first of which treats of Frictional or Static Electricity, the second of Voltaic Electricity, the third of Magnetism. Starting with the simple phenomena of attraction and repulsion, the author passes at once to the great subject of induction, and describes with clearness the electrophores and kindred machines; he then discusses electrical distribution and point discharge. The fourth chapter treats of electrical machines, both of the ordinary kind and the newer forms of Bertsch and Holtz. The Leyden Jar and various forms of condenser receive full treatment in the next chapter, and this is naturally followed by an account of the nature and effect of electrical discharge. The account of electrical measurement and the much-vexed definition of "potential" is given in the final chapter of the first book. *A propos* of the last term, our author says: "The work which a raised body is capable of doing, if it fell a certain distance, is called the potential work of the body, or, simply, its (mechanical) potential." It is clear that the potential will vary as the distance between the earth and the raised body varies. Now, suppose we take a unit

* On p. 85 Harnack says, "Sed Clemens Christianus e gentilibus erat, non Judaeo-Christianus." He does not give his reasons for this statement.

* See ACADEMY, June 17, p. 587.

of electricity, which is thus defined: "Each of two equally-charged bodies is said to have a unit of electricity, if, when at a distance of one centimetre from one another, the one will repel the other with a force which in one second of time would impart a velocity of one centimetre a second to one gram of matter." If we take the electrical condition of the earth as 0 or neutral, the unit of potential will be the work done by a unit of electricity in moving from its place to the earth. "The electric potential of a body is the mechanical work which the electricity of the body is capable of doing in passing to the earth, or other indefinitely great reservoir of electricity of the same kind as the earth's." In the second book, on "Voltaic Electricity," we may specially notice the capital treatment of the subject of measurement given in the fourth chapter: this embraces an account of Ohm's law, the sine, tangent, and absolute galvanometers, the voltatist, voltameter, rheostat, and rheocord. About thirty pages at the end of the work are devoted to magnetism, and this subject, together with diamagnetism, seems to have been rather slightly treated; at the same time it is to be borne in mind that electro-magnetism and magneto-electricity have been treated of pretty fully in earlier parts of the work. The work, as a whole, is fully worthy of the author, who has devoted much care and attention to its preparation, and we cordially recommend it to the earnest notice of the student, as the best manual of Electricity which exists in our language.

Telegraphy. By W. H. Preece, O. E., and J. Sivewright, M.A. (Longmans.) This work is intended rather for the operators and artisans engaged in telegraphy than for the amateur or student. It enters minutely into an account of the nature and construction of telegraphic instruments, the modes of signalling and testing, and the construction of overground lines. The drawings are excellent, and are made to scale. It is much to be regretted that the subject of submarine cables has been omitted: but there can be no doubt that the work will be found most useful by all telegraphic engineers, and that it will form a valuable introduction to the larger and more complete works on the subject.

Euclidian Geometry. By Francis Cuthbertson, M.A. (Macmillan.) *Elements of Euclid adapted to Modern Methods in Geometry.* By J. Bryce, M.A., and David Munn, F.R.S.E. (William Collins & Sons.) *Practical Arithmetic for Schools.* By Robert Miller, M.A. Parts I. and II. (Simpkin, Marshall and Co.) A novel feature in Mr. Cuthbertson's work is the introduction of tables at the commencement showing the classification of subjects, and giving at the same time an analysis of the contents. The book is to be much commended for its simplicity and conciseness. Some problems which are usually given at great length are condensed into half a page of print, without loss of clearness. The main object of Messrs. Bryce and Munn has been "to render the study of geometry more easy and attractive, to adopt a mode of treatment suggestive of other truths, and to introduce such improvements as should tend to remove the desire that Euclid should be replaced by any other text-book." In this we are inclined to think the authors have only partially succeeded. Mr. Miller's Arithmetic is made up of very little rule, and an immense quantity of example in the old Cocker style. The youth who works out one-half of these correctly may safely go on to higher matters.

The Elements of Geometry, in Eight Books; or, First Steps in Applied Logic. By L. J. V. Gerard. Part I. Plane Geometry. (Longmans.) An attempt has been made in this work to present to the student geometry in a pure scientific form, and to make it throughout an illustration of the laws of logic. In this we think the author has to a great extent succeeded. His definitions are clear and concise, and his theorems are worked out

in the most intelligible and condensed manner. The introduction is mainly devoted to definitions in connexion with extended and homogeneous space; he tells us that "geometry is the science of space;" geometrical figures are defined as "mental determinations of space;" incidentally we have little subtleties of this nature: "The idea of infinitely small is produced by denying magnitude to any figure; in the same way the idea of infinitely great is acquired by denying form to a figure." Again, in reference to the measurement of a magnitude, we are told:—

"The mind not being able to compare any but such magnitudes as have properties in common, it is obvious that the extension of any figure, that is, its magnitude, can only be measured by the magnitude of a figure of the same kind. Thus the unit for measuring solidity must be a volume, the unit of area must be an area, and that of length a length. But, as the elements of extension may be considered as so many lines, all measurement in geometry is reduced to the measuring of lines."

The introduction is succeeded by four books, which treat respectively of lines, angles and proportional lines, plane figures, and areas. A second volume containing four additional books will complete the work, which will be welcomed by a large class of students and teachers.

Manuals of Elementary Science published by the Society for Promoting Christian Knowledge, 1875. *Astronomy.* By W. H. M. Christie. *Physiology.* By F. Le Gros Clark. *Zoology.* By Alfred Newton. *Geology.* By T. G. Bonney. *Botany.* By Prof. Bentley. *Chemistry.* By A. J. Bernays. These manuals are admirably adapted for school purposes. They are for the most part clearly and concisely written, and are well illustrated. We may specially notice the numerous and beautiful illustrations of the *Zoology*. It is a little to be regretted that a few pages of questions are not appended to the books, but the teacher can of course improvise questions. The cause of science is not likely to suffer in our schools for want of suitable text-books. There are at least five distinct sets of cheap text-books of science issued by different publishers for the use of schools, and it is not always easy to decide between their respective merits.

A Class-Book of Chemistry on the Basis of the New System. By Edward L. Youmans, M.D. (Henry S. King and Co.) This work is not intended to be used as a manual for special chemical students, but is rather intended "to meet the wants of that considerable class, both in and out of school, who would like to know something of the science, but who are without the opportunity or the desire to pursue it in a thoroughly experimental way." So far it labours under a great disadvantage, because chemistry can only be properly pursued as a thoroughly experimental science, and can only be properly taught when experiment is largely blended with book-instruction. As a manual of general principles, however, the book will be useful. It is very comprehensive, embracing within the limit of 340 pages, Chemical Physics, Chemical Principles, Descriptive Chemistry, Organic Chemistry, a fairly good index, and questions on each chapter. With so large an amount of matter in so small a space, we must expect to find examples of slight and insufficient treatment. Too much has been attempted, and many of the subjects are touched upon, but not fully explained. At the same time the book contains mention of most of the recent advances in science; the section on Spectrum Analysis is full, and has been carefully prepared, and the account of Chemical Principles will be found to be very serviceable to the student. The book is well illustrated, and if carefully read side by side with experimental work, cannot fail to give the reader a good insight into modern chemistry.

Railway Appliances. By John Wolfe Barry. (Longmans.) This work aims at the description of the details of railway construction subsequent to

the completion of the earthworks and structures, and it is designed both for the use of the general reader and of the student of engineering. The former it enlightens as to the nature of the mechanical appliances concerned in the transit of himself or his goods with speed and safety; the latter will gather from it minute details as to the permanent way, and signals, and rolling stock. The subject is treated of in seven chapters, the first of which discusses the "Acts of Parliament and other regulations affecting railways." The second chapter is devoted to the "Permanent Way," a term used to distinguish the finished railway from the temporary tram-roads used by contractors while they are constructing the line. A long table giving the gauges which are used in various countries of the world is of interest, although the celebrated "battle of the gauges" has long passed away. The gauge which is in use in this country—4 feet 8½ inches—is also employed in Canada, Nova Scotia, and New South Wales, in France, North Germany, Holland, Belgium, Austria, Hungary, Turkey, Switzerland, Italy, Sweden, Denmark, Uruguay, and Peru, and to some extent in Norway, Egypt, Brazil, and the United States. The smallest width of rail in use in any country is 3 feet 3 inches, and the largest 8 feet, in all cases measured between the inside edges of the rails. A very concise description of the various forms of rail, and the methods of fastening them, concludes this chapter. The third chapter treats of "Points and Crossings," the fourth of "Signals," and the fifth of the all-important "Block System." The last is fully described, and the objections which have been urged against it are one by one dismissed. The author, in reply to those who affirm that every possible means of ensuring safety ought to be everywhere taken, points out that

"Improvements in railway safety appliances will be retarded unless a proper subordination of that which is mechanically possible to that which is financially rational is recognised; and unless the money that is available for the purpose is spent in the best possible manner. . . . It must be borne in mind that, in endeavouring to guard against every danger, one can 'buy gold too dear;' for if every possible known precaution is to be taken, regardless of cost, it may not pay to work a railway at all."

The sixth chapter gives an account of the arrangement of certain typical stations, and a long final chapter treats of "Rolling Stock." In this the locomotive itself is altogether omitted, because it was found to be impossible to give any satisfactory account of it within the allotted dimensions of the book. The whole subject has been clearly treated by the author, and the work may be commended, not only to the general reader and to the engineer, but also to the guards, engine-drivers, and signalmen of our various railway companies.

Elements of Acoustics, Light, and Heat. By William Lees, M.A. (London and Glasgow: William Collins.) This small text-book may be commended both for its cheapness and for the amount of information it contains. It is well suited to be used as a text-book in schools, provided that it is well supplemented by the master; for it must be confessed that the explanations are not always as full as they might be. The illustrations are numerous, and, considering the price of the book, are good. A far larger number of questions and exercises might with advantage be added in a second edition.

Wood's Elements of Algebra. Edited by Thomas Lund, B.D. (Longmans.) This is the seventeenth edition of a book which has long been known to the scholastic world. The previous editions were designed rather for the adult student than for the schoolboy; but, as at the present time a schoolboy's reading is much more extensive than it used to be, the editor has in this edition adapted his book for school purposes, and we think he is to be congratulated on the result. Indeed, it would not be easy to put into the hands of an intelligent schoolboy a book better adapted

to give him a sound and fairly extensive knowledge of algebra. It is perhaps rather too bulky for a school-book: we should have been inclined to shorten or to omit the chapters on Simple and Compound Interest, Discount, Equation of Payments, Annuities, and Renewal of Leases: such work is not necessary to knowledge of algebra, and should be regarded by the student rather as problem-work than as ordinary book-work. Again, in a school algebra a chapter on Probability is out of place. The chapter on the Discussion and Interpretation of Anomalous Forms is excellent, and the student will be repaid by a careful study of it; the same may be said of the pages devoted to Arithmetical and Symbolical Algebra.

Tables, Nautical and Mathematical, for the use of Seamen, Students, Mathematicians, &c. By Henry Evers, LL.D. (London and Glasgow: William Collins and Co.) This work consists of Tables of Logarithms of common numbers from 1 to 10,000, of Logarithmic Sines, Tangents, and Secants, to every point and quarter-point of the Compass, and of various tables connected with nautical astronomy. The compilation has been carefully made, and will be found to be trustworthy.

We have also received *Exercises in Electrical Measurement*, by R. E. Day, M.A. (Longmans); *Notes on Collecting and Preserving Natural History Objects* (Hardwicke); *Elements of Algebra*, by E. Atkins (Collins); *Principles of Approximate Calculations*, by J. J. Skinner, C.E. (New York: Henry Holt); *General Proof of Gauss' Rule for Finding Euler Day*, by Samuel Butcher, D.D., Bishop of Meath. G. F. RODWELL.

SCIENCE NOTES.

BOTANY.

The Oaks of the United States.—It is unnecessary to say that any contribution to our knowledge of the North American oaks, especially in reference to characters by which the species may be discriminated, will be welcome to all interested. Dr. George Englemann has recently published a synopsis of the oaks of the United States, in the *Transactions of the Academy of Sciences of St. Louis*, of which we have a reprint. For his main divisions Dr. Englemann adopts the popular distinction of White Oaks and Black Oaks, which are easily distinguishable, and accompanied by structural differences. Thus: (1) *Leucobalanus: ovula abortiva infera vel raro lateralia; stamina plerumque 6-8; stigmata sessilia vel subsessilia; nux intus glabra seu rarissime pubescens*; and (2) *Melanobalanus: ovula abortiva supera; stamina plerumque 4-6; styli elongati demum recurvi; nux intus sericeo-tomentosa*. The result of Dr. Englemann's researches is a considerable reduction of species. The divisions as above defined contain thirty-seven species; and there is one more, belonging to De Candolle's section *Androgyne*, *Quercus densiflora*, which has the male catkins erect, and otherwise differs from the section *Lepidobalanus*, under which Englemann's divisions come. This classification has the appearance of being a useful one; but a practical trial alone could test its merits. Dr. Englemann also reviews the characters of value in discriminating species.

Age and Leafing of Trees.—To the *Archives des Sciences de la Bibliothèque Universelle* for June, 1876, M. Alphonse de Candolle contributes an article entitled "L'âge d'un arbre a-t-il une influence sur l'époque moyenne de la feuillaison?" He first quotes the replies to queries on this subject from Prof. Decaisne, of Paris, and Prof. Caruel, of Pisa, who had both made observations at his request. From their observations it would seem that age had nothing to do with the date of the leafing of trees, or that the differences observable were simply individual peculiarities. In some cases the old and young trees of the same species

burst their buds at the same time, while in others the older, in others the younger, developed their leaves first. But the most valuable and original material for affording some light on this subject was "a series of observations made upon two trees of the same height above the ground during fifty-seven and sixty-eight years respectively." These observations were made upon two horse-chestnut trees at Geneva, and are regarded by the learned author as perfectly trustworthy. The average date of the leafing of the one longest under observation is 94.9 days after January 1, and of the others 93.61 days. Dividing the whole term into six, four, or two periods of equal duration, the average dates exhibit no essential progression or retrogression. But it is worthy of remark that during the third period of seventeen years, 1842-58, the average is 2.5 days later than during the fourth period, 1859-75. Observations on a grape-vine by Messrs. Macleod and Lanezweert at Ostend, from 1843 to 1875, indicate a gradual forwarding of the date of leafing. Thus during the first period of sixteen years the average date was 16.6 days later than the average of the succeeding seventeen years. But De Candolle thinks this may be due to diminished vigour or pruning and other artificial conditions. In a word, the age of a healthy tree exercises no appreciable influence.

Gerard's Catalogue of his Garden.—A reprint of "the first professedly complete catalogue of any one garden, either public or private, ever published" certainly deserves putting on record here. Gerard's *Herball* is by no means a rare book; but the *Catalogus arborum fruticum ac plantarum tam indigenarum quam exoticarum in horto Johannis Gerardi civis et chirurgi Londinensis nascentium* is exceedingly rare. This reprint, therefore, which we owe to the liberality of Mr. B. Daydon Jackson, will be extremely welcome to all interested in the early introduction of exotic plants. The reprint consists of a limited number of copies for private circulation only. Without being an absolute fac-simile it is almost an exact reproduction of the original, the first edition of which was published in 1596. A second edition appeared in 1599, which Mr. Jackson also reprints, together with some of his own remarks and notes on the *Herball*, and a Life of Gerard. But what will be found especially useful is the list of modern names affixed to the old ones. Gerard's *physic* garden was in Holborn, and included upwards of a thousand different kinds of plants. The only thing for regret in connexion with Mr. Jackson's reprint is the fact that he felt himself so discourteously treated by the officers of the Surgeon-Barbers' Company, from whose archives the previously unpublished matter was drawn, as to put it on permanent record in his introduction. There are several other lists of this kind we should be glad to see reprinted—Tradescant's, among others, as the younger Tradescant made a voyage to Virginia and introduced many American trees.

The Flora of Norway.—Mr. Axel Blytt has published, in English, an *Essay on the Immigration of the Norwegian Flora during alternating Rainy and Dry Periods*. Mr. Blytt founds his hypothesis on the characteristics of the present vegetation, and the nature of the composition of the peat bogs that abound in some parts of the country. Of course we have not space to follow him in all the details of the facts which he adduces in support of his position; but the gist of the whole may be set forth in a few words. The plants are divided or classed as arctic, sub-arctic, boreal, atlantic, sub-boreal, and sub-atlantic; and their general features of distribution are shown on a coloured map. So far as the present vegetation is concerned, it is the present distribution of the plants of each of these classes, and their distribution collectively, that afford data for argument. It is more particularly with reference to the great leaps made by the different classes of vegetation that the question is examined. The flora of the

friable shales, which are, so to say, the oases in the hard rocky mountains, are especially characterised by four species—namely, *Dryas octopetala*, *Salix reticulata*, *Thalictrum alpinum* and *Carex rupestris*. If we arrange the localities according to the number of rare Alpine plants (that is to say, such species as have special localities indicated for them in the local floras) found in each of them the order of the series will be as follows:—Lapmark of Luleå, 50; Dovre and Foldalen, 46; Lapmark of Torneå, 45; Vaage and Lom, 44; Salten, 43; Lapmark of Piteå, 40; Alten, 37; Tromsø, 29; Maalselven, 28; Ranen, 28; Tonset, 16; Urland, 14; Vasendli, 14; Haart-eigen, 8. Thus, the number of rare species decreases rapidly towards the south and west; and the richest regions lie farthest from the ocean, or are the best protected against it. With regard to the influence of temperature, it is found that Arctic and Alpine species in the botanical garden at Christiania endure the strongest summer heat without injury, while they are often destroyed when not sufficiently covered during the winter. Remarkable leaps are exhibited by many species, which only occur in localities separated by several degrees of latitude. We mention a few of the most considerable. *Artemisia norvegica* grows at Dovre, and it is not found elsewhere in the Old World; *Carex scirpoides*, *Draba crassifolia* and *Platanthera obtusata* also occur in Norway only in the Old World, reappearing in Greenland and North America. *Luzula arctica* leaps from Dovre to the Lapmark of Luleå (44° to 5° of lat.), and thence to Spitzbergen; *Arenaria ciliata* exhibits a leap of 15° of lat.; and *Papaver nudicaule*, *Rhododendron lapponicum*, *Carex misandra* and *rufina* leaps of from 4° to 7° of lat. Now, although everything indicates migrations to short distances, as a rule Mr. Blytt thinks that these large leaps are easily intelligible if we assume that the climate has undergone considerable alterations since the ice period; that it has been at certain times more insular and at others more continental. But it is mainly in the order of the disposition and the constituents of the various strata of the peat bogs that Mr. Blytt finds his views supported. In a few words, they exhibit indications of alternate wet and dry periods, inasmuch as there are remains of a pine-forest, upon which is deposited a layer of moss-peat, then another submerged forest composed of deciduous trees, and so on. "During such alternating periods," says the author, "our country seems therefore to have received its present vegetation. We see it first covered with inland ice, which projected out into the sea, and dispersed Scandinavian migratory blocks over the plains of central Europe. When the ice, during a drier period, retired from the shore, a flora immigrated, resembling that which now adorns the wastes of Spitzbergen, North Greenland, and Melville Island: small, hardy, tufted plants, which often display an unexpected splendour of flowers with the purest and deepest colours. Then came the gray osier, juniper and birch, cherry, ash and rowan, with a host of new immigrants, including *Mulgedium* and *Aconitum*. The moisture increased, peat began to grow, and the Arctic flora to recede. But the climate became warmer; the ice melted more and more; elm, hazel, lime, ash, and maple came with numbers of other species that grow in their company. At that time the climate was dry; but when the land rose higher a new revolution came about, and a long rainy period buried these deciduous trees in peat. A new dry period followed, and pine forests grew on the bogs. Again came a rainy period, and the pine forests were buried in peat. And during these last changes in our climate there came probably that part of our flora which is peculiar to our lowest southernmost regions."

FINE ART.

RESEARCHES RELATING TO ALBRECHT DÜRER.

Untersuchungen über Albrecht Dürer. Von Dr. Alfred von Sallet. (Berlin: Weidmann, 1874.)

UNDER the above title, Dr. Sallet, a distinguished German member of the London Numismatical Society, has published the result of a long and careful study of Dürer's works, especially of the medals usually attributed to him, and of the drawings in the Berlin collection.

As a contribution to the disputed question as to the authenticity of the Berlin drawings and those originally belonging to the same collection which are now preserved at Bamberg and Weimar, Dr. Sallet points out the remarkable resemblance that exists between many of these large portrait-heads and those on the medals struck at Nürnberg about the beginning of the sixteenth century, representing various members of the Rath of Nürnberg, German princes and bishops, and other distinguished persons.

The resemblance, judging from the two examples given in illustration, is certainly very striking, not only in point of feature, but also in little details of costume; yet this resemblance, although it evidently indicates some connexion between the drawings and the medals, does not by any means prove that the former are by Dürer.

The history attached to the large profile portraits of the Berlin, Bamberg, and Weimar collections is somewhat curious. They have always been supposed to be those which Dürer mentions having drawn (*conterfet*), in his sketch-books (*Bilderbücher*), during his visits to Augsburg in 1518 at the time of the Diet, and to the Netherlands in 1520-21. These sketch-books passed soon after Dürer's death into the possession of the Pfintzing family, of Nürnberg, and were stowed away, so it is said, with family papers for more than 200 years. They were then brought to light and acquired by the well-known collector Baron Derschau, who afterwards sold part of them to Nagler (those now at Berlin *), and the other part to Joseph Heller, who has given a detailed description of them in his voluminous catalogues of Dürer's works without throwing the slightest doubt upon their authenticity. This, indeed, does not seem to have been doubted by any one, until Dr. Moritz Thausing, in the *Zeitschrift für bildende Kunst*, vol. vi., 1871, brought forward some very powerful reasons against it. In his opinion the drawings were the work of a forger, whose "clumsy imitations" he considers it a duty owed to Dürer's name to expose.

This view, however, was violently opposed by Von Eye, Hausmann, Von Zahn, and several other distinguished art-critics, and a long controversy took place on the subject without settling the question one way or another. The difficulties involved in supposing these drawings to be the work of a later artist purposely imitating Dürer's style and forging his monogram are too great to admit of this solution. Even Dr. Thausing

has been obliged to give it up. The water-marks on the paper, as Hausmann pointed out, are the same in many instances as those on Dürer's known works; the costume is accurately that of the beginning of the sixteenth century; and many other indications all lead to the conclusion that, if not by Dürer himself, they must at all events have been done by a contemporary artist enjoying like opportunities with him for portraying the distinguished persons present at the Diet of Augsburg and afterwards in the Netherlands. This is extremely unlikely. Dürer, we know, was at the Diet, for he took while there the portrait of the Emperor Maximilian, "in his little room high up in the palace," as he himself tells us, beside a number of other sketches of the various princes, bishops, and other celebrities there assembled. At the Diet held in Nürnberg in 1522, he must also have had an opportunity of sketching these persons, as well as the members of the Rath of Nürnberg, with many of whom he was well acquainted. Finding these contemporary portraits, therefore, it would be natural to suppose that they are the identical ones which Dürer so often mentions his having taken, were it not for a certain mechanical method of execution, very unlike Dürer's, that causes Dr. Thausing to stigmatise them as the work of a "bungler" in art. This is altogether too severe. Other critics—Dr. von Eye, for example—speak of them as "treffliche Kunstwerke," and consider them as quite in Dürer's manner.

Without venturing to decide where German doctors disagree, I think that this new observation of Dr. Sallet's that the drawings are in a great many cases entirely identical with the medals may, perhaps, be explained by supposing that Dürer really executed these portrait-heads for the very purpose of having them struck as medals, but that, instead of entrusting his own original sketches to the medallist, he had them copied by one of his pupils or by some inferior artist of the time, and that it is these copies, and not Dürer's original drawings, that have been preserved. This would account for a certain stiffness in their execution, and also for their being nearly all profile-heads, the view best suited for medals. It would explain also Dürer's monogram being placed upon them without their being necessarily either originals or forgeries. If the designs are really by him, some such copying must, if we consider it, have taken place. Dürer would scarcely have sent his own rough sketches in his private sketch-books to the die-sinker.

With regard to the medals ascribed to Dürer himself, Dr. von Sallet considers that only three of them have any claims to being accepted as genuine. These are: the head of Dürer's father in profile, dated 1514; the full-faced woman's portrait, said to be Agnes Frey; and the portrait of Michael Wohlgemuth. The medal designated as that of Agnes Frey has recently been reproduced as an autotype illustration in the fifth annual report of the Deputy-Master of the Mint. It is an excellent example of early German art, but it is not like the other portraits supposed to be of the Dürerin. It does not, indeed, look like a portrait-head at all, and more probably represents some

mythological or allegorical being—a plump German Venus, perhaps. It may possibly be intended for a Madonna as some critics have surmised, but, if I remember rightly, it far more closely resembles the unpleasant *Lucretia* of the Munich Gallery than any of Dürer's Madonnas. It is dated 1508.

What share Dürer had in the series of Nürnberg portrait-medals before mentioned remains doubtful, but it is absurd to credit him with the numerous medals that exist bearing his own portrait. These are evidently later works, copied perhaps from some original struck in his time. Those of later date are for the most part merely taken from Melchior Lorechs' engraving.

Dr. Sallet's remarks on the copper engravings and woodcuts are not always very original. For instance, he points out that the engraving known as "*La Vierge à la Porte*" is not taken from any one drawing, as Bartsch supposes, but is composed of several motives taken from different prints by Dürer and pieced together so as to form a harmonious whole. This observation was made by Mr. G. W. Reid, and published in the *Fine Arts Quarterly* in 1866. It has long been an accepted fact. The interpretation of the plate known as "*Jealousy*," as "*Nessus, Deianira and Hercules*," is very far-fetched, and even Vasari's statement that it represents Diana beating a nymph is more reasonable. Dürer himself would undoubtedly be greatly perplexed at the numerous fanciful and occult interpretations that have been lately given of the meaning of many of his works. MARY M. HEATON.

CONZE'S ILLUSTRATIONS IN ARCHAEOLOGY.

Vorlegeblätter für Archäologische Uebungen. Seventh Series. By Professor Conze. (Vienna, 1875.)

THIS annual issue of plates for the purpose of illustrating special subjects of discussion is a feature in classical archaeology which has successfully commended itself for the past seven years. To what extent that success may have been shared in by this country we have no means of ascertaining; but there are obvious reasons for doubting whether such a publication could be so fully appreciated here as in Germany for example. A series of plates, with a single sheet of letterpress telling where the several objects engraved are to be found and the source of the engraving, naturally throws one into an attitude of contemplation as to the various probabilities by which the explanatory text may have gone astray in the sending, or been delayed by the printers. The text never comes, and in time we discover that, not being in the position of a German student under a professor who would explain all the points and bearings of the discussions for which the plates are intended, we must turn to special memoirs, articles in magazines, and even books, for the necessary enlightenment, with the probability, also, sometimes that in one or other of these sources we may find the thing engraved already. One of the interesting disputes at present turns on a vase found at Kerch, and now in St. Petersburg, with a representation of the central group in the western pediment of

* These have recently been capitally reproduced in photolithography, and published by Herr Soldau, of Nürnberg.

the Parthenon—a vase which Stephani has published along with a colossal memoir, to which, in the last number of the *Archäologische Zeitung*, Petersen (author of *Die Kunst des Phaidias*) replies with acrimony and large details. Conze republishes the vase; but, considering that the Petersburg memoir is indispensable to the controversy here where its various points cannot be gathered at second hand, the possession of duplicate plates is a necessary consequence. The other engravings bearing upon this subject are mostly from Michaelis' work on the Parthenon, a book which is also necessary for the dispute.

This is no complaint against Conze, who is Professor of Archaeology at Vienna, and must consider in the first place the wants of German students. Besides, we have purposely chosen one of the exceptional instances, and taken the worst view of it. It will convey a fairer notion of the service rendered by these plates if we point out that the last two series (VI.–VII.) contain engravings of no less than seventeen Greek vases by the painter Duris, of which five had not before been published; that this painter had been classed in Brunn's generally known theory as one of the imitators of early style; and that this condemnation could only be fairly sustained or set aside after such an examination of his works as is now for the first time possible. Again, in the previous series (V.) we had eight vases by the similarly dubious painter Euphronios, of which one had not been published before. Apart from the discussion, it is manifestly valuable to those also who maintain a more general interest in Greek vases, to find the works of one painter collected together in this way and very admirably engraved. His peculiarities become striking by repetition, and nothing could show better how erroneous is the impression of uniformity which many carry away from the inspection of any large number of vases.

It is curious that these seventeen vases of Duris are, with one exception, wine-cups, shallow and wide, with the principal design painted round the outside in two scenes separated by the handles of the cup. His designs fall into two classes, according as the composition presents a continuous and even interest like that of a frieze, or presents in the centre a culminating incident which sends a shock through the figures at each side, as in the manner of a pedimental composition—for example, the pediment groups from Egina in Munich. A vase of this shape, if considered as an immoveable object, ought to be treated like a pediment where the central interest dilutes itself gradually in the lessening space towards each extremity, because on it also the space is practically lessened towards each side. Four of the vases of Duris are treated in this way, and, so far as we can judge, they surpass the others in artistic force, and certainly in attention to the actual condition of flesh and muscle under varying positions of the body. The central incident is a fight taken at the moment of greatest triumph to one side and grief to the other, when one of the two combatants has just received a blow from which he falls before his enemy has recovered from the impetus with which he

dealt it. The scene has almost the concentrated interest of a duel, except that the seconds here rush in to prolong the fight. On three of these vases the composition on each side consists of five figures, the falling combatant having two companions, the victor one. While in these cases the main lines of the composition converge towards the highest point on the round of the vase, there are others, as in the two representations of the quarrel between Achilles and Agamemnon, where the centre is occupied by a calm mediator, and where the main lines of the groups at each side partly converge and partly diverge consistently enough with the futile rage of the two heroes, and at the same time binding the composition together.

A composition like that of a frieze, with a continuous and even interest running through it, could only be applied to vases of this shape on the understanding that they are moveable objects, held up in the hand and lightly turned round. But, as we have said, Duris is by no means so successful here. In several instances he is distinctly monotonous, but not in the two vases of this class in the British Museum, in both of which there is just the variety of figure and attitude necessary to break the flow of lines, as ripples break the surface, but do not impede a stream. Another instance of this is on the vase with scenes from the gymnasium, where aged tutors seated gravely alternate with boys busy learning to read, write, and play on the lyre or flute.

The series of illustrations for last year contains, besides six vases from the hand of Duris, and the plates already mentioned as referring to the western pediment of the Parthenon, also a collection of the supposed representations of the group of Harmodios and Aristogeiton which Xerxes is said to have carried off from Athens—or, perhaps, rather of the group which was made to replace it. The original figures were returned to Athens, it is said, in the time of Seleucus Nicator, and it would be interesting if it could be shown that among the copies reproduced by Conze some had been made from the original group after its restoration, as the figures on the Attic tetradrachms may have been, while others—for example, the two statues in Naples—had been studied from the group substituted after the robbery of Xerxes.

We have noticed only what seemed the most interesting of the questions raised by these illustrations. It is greatly to be wished that they might be more generally useful here, and it is satisfactory to be always able to say of every new publication by Prof. Conze that it commands admiration through all its details.

A. S. MURRAY.

ART BOOKS.

A PORTFOLIO, containing six etchings or sketches by the late Frederick Walker, carefully printed on fine Japan paper, was sent me some weeks ago from London by Mrs. Nosedá. It has given me great pleasure, not merely because I knew Fred. Walker slightly, enough to feel the unmistakable originality of his work as a painter, but because I have thereby been enabled to make my French friends acquainted with one to whom I had frequently alluded both in articles and in conversa-

tion, and whom, to justify the enthusiasm and esteem I expressed for him, I could only introduce them to in a series of woodcuts, admirably engraved for the *Cornhill Magazine* by Mr. Swain. The sympathetic manner in which, while the posthumous exhibition of his pictures was being held, Fred. Walker's work was reviewed in the ACADEMY, renders any expression of my opinion with regard to him in your columns unnecessary. I merely wish to establish my claim to having been the first, I dare not say the only, French critic who brought his name into public notice here. I spoke of him in the *Gazette des Beaux-Arts* with reference first to his water-colour drawings, and afterwards to the oil-paintings exhibited at the Royal Academy. I was struck first by his natural and refined style, and afterwards by his delicate palette and bold drawing. He seemed to me quite distinct from the English contemporary school, owing to the unusual qualities of observation and sincerity he displayed. His work for the illustrated papers, which have a peculiar local flavour of their own, was, I think, of great service to him. He gave promise of becoming what I understand by "a master"—namely, one learned in the things of the past, curious about those of his own time, and in full possession of the means of realising and expressing his thought. In these six etchings, as in his smallest sketches, Walker has shown his observant nature and delicate taste. The manner he afterwards acquired he did not yet possess. I believe Mr. Heseltine, some of whose series of landscapes, mostly drawn and engraved direct from nature, I have, bit these plates. The depth of the bite could not have been better calculated. Of course beginners must always get their first instructions from one experienced in the process, for all the treatises imaginable on the subject could not make it practically intelligible to them. But the critical moment, "le moment psychologique," comes to the etcher when he finds himself alone, face to face with his tools and materials—plate, varnish, candle, needle, basin and bottle of nitric acid: then, when the copper is immersed in the greenish fluid and the air-bubbles collect like a chain of beads on the bright line cut in the black varnish by the needle, how is he to judge of the bite? how ascertain to what depth the acid has eaten into the copper, has hollowed the furrow which in another moment will fill with ink under the printer's pad, and disgorge itself on the paper like a sated leech? Only in solving these questions does the etcher's hidden instinct, his genius, reveal itself, does real originality show itself. I do not suppose that Walker knew these emotions, which only reach their dramatic grandeur in the solitude of the studio. One of these etchings, a little round-faced, smiling girl, sitting with what appears to be a basin of food on her lap, reminds us in artlessness both of type and work of some of Wilkie's essays likewise drawn with the needle. Another, a slight sketch, represents a young man's face, with moustaches, and disordered hair. I saw Frederick Walker once or twice. He was already in an advanced stage of consumption. The glowing look in his eyes and face was what chiefly impressed itself on my mind, not the form of his features. Is this his likeness? Another is an unfinished sketch as regards the whole right side of the composition: an old man, bareheaded, sitting at a table talking to a woman. The fourth, a dry-point attempt, the bust of a man apparently walking in the country; a first sketch, perhaps, for the most finished of the six representing a blind man walking along a road, at sunset, tapping the ground with his stick while he leans with his left hand on the shoulder of a young lad, with his hands in his pockets, carrying a bundle tied up in a handkerchief: a melancholy composition, expressive in drawing, and very sweet in colour. We have Walker here in his entirety. The lights just touching the dresses, the hill bounding the horizon at the back of a tilled field, are rendered with a skill which

shows that, had he lived, Walker would have become as famous for his etching as he has for his water-colour painting. The last of the six represents seemingly a woman in in-door dress, sitting in a court-yard shelling peas, a study which must have been drawn on the copper from nature. The indications of colour are true and varied.

The second volume of the charming little octavo edition of Alfred de Musset's complete works is just out (Lemerre). The portrait it contains of the poet, though not larger than a penny, is a master-piece, both as regards resemblance and picturesqueness. It is an etching by M. Martinez, a young engraver, from the original terra-cotta medallion modelled from life by David d'Angers in 1833. This medallion is more spirited in execution, and more lofty in expression than the bronze one which succeeded it, and is most carefully preserved by the poet's brother, M. Paul de Musset. The romantic war was then going on, and Alfred de Musset was in the full pride of youth, beauty, and success, and wore his hair in the Byronic fashion.

M. J. J. Guiffrey has just completed his reprint of the catalogues of all the exhibitions of pictures and sculpture of the eighteenth century. The catalogues of the exhibitions of the Royal Academy alone, with those under the Revolution—that is, from 1673 to 1800—and the general index of the exhibitors and critics, form forty-three little volumes. They are illustrated with head- and tail-pieces copied from old catalogues. These are followed by a little volume of *Notes et documents inédits sur les Expositions du XVIII. siècle*, and one consisting of the seven catalogues of the *Académie de St. Luc*, dating from 1751 to 1774, and brought to your notice in a previous letter. The concluding volume of the series will in a degree be useful to all who wish to register the movement in French art at a period when it shewed such life and originality. The volume is called *Réimpression du livret de l'Exposition du Colisée en 1776, avec notice historique sur le Colisée, suivi de l'analyse du Salon de l'Elisée en 1797, avec des notes et une table* (Baur). The *Colisée* was a place of public amusement something like your Vauxhall. It was erected in the Champs Elysées from a design by an architect of the name of Le Camus, and swallowed up enormous sums of money. Pictures were merely accepted as a possible source of attraction. Every means was tried to tempt public curiosity—fancy balls, concerts of all kinds, competitive firework displays, and so forth. At last the Academy, growing needlessly uneasy with regard to its rival, got the King in 1777 to prohibit the holding of all art-exhibitions there in future.

M. Charles Ephrussi, a young Russian resident in Paris, who in feeling and in knowledge of our language is a fellow-countryman of ours, has just brought out a quarto volume, entitled *Notes biographiques sur Jacopo de Barbari, dit le maître au Caducée, peintre-graveur vénitien de la fin du XVI. siècle* (D. Jouaust). The work contains seven proofs before letters, and in order not to recur to them I will specify them at once as being, some of them, facsimile engravings done by Amand Durand's heliographic process; others, extremely precise woodcuts. The first five are reproductions of dry-point engravings of Jacopo de Barbari's, which are very rare; *Le Grand Sacrifice à Priape*, *Saint Sébastien*, *Combat de Tritons*, *Apollon et Diane*, and *Les Suppliciés*; the sixth is Albert Dürer's *Adam and Eve*, and a bronze plate, *Orphée et Eurydice*, the original of which is the property of another very enlightened amateur, M. Dreyfus, who has a splendid collection of objects of art belonging to the time of the Italian Middle-Ages and Renaissance. This Jacopo de Barbari was made the subject of a special study in the *Gazette des Beaux-Arts* by its late manager, Emile Galichon. Galichon, who was the owner of the magnificent collection of old engravings which was sold by auction last year, had discovered a very

important and very well preserved picture of this master's. His study was extremely conscientious, but in the constant progress of science new facts and new arguments, which rectify and complete it on many points, have come to light, and with these M. Ephrussi now presents himself to our notice. Briefly stated, the new conclusions he has arrived at are as follows:—1. Venice is satisfactorily proved to have been the birthplace of the Master of the Caduceus; in one of the rough drafts for his preface to his *Treatise of the Proportions of the Human Body*, the MS. of which is in the British Museum, Dürer wrote: "Jacobus né à Venise, peintre gracieux." 2. Barbari must have spent some time in Nuremberg and seen Dürer there before 1495: in fact, Dürer's family papers show him to have been in Nuremberg from May 17, 1494, up to the time of his journey to Venice, about the year 1506. On the other hand, supposing Jacopo to have been engaged on the wood-engraving of his large plan of the town of Venice from 1498 to 1500, his relations with the great German master must date from 1494 to 1498, in testimony of which M. Ch. Ephrussi quotes a fragment of a letter of Dürer's to Pirckheimer (February 7, 1506), wherein he speaks of what, as an artist, he admired sixteen years ago, and cites immediately afterwards Master Jacob as one who seems to him to have deteriorated. 3. The similarity of style and execution often noticed between these two masters proceeds, not from the imitation of the one by the other, but from a common source of instruction, that source being Michel Wohlgemuth's studio, Martin Schon-gauer's engravings on metal, or such engravers as Veit Stoss, Glockenton of Nuremberg, and Wenceslas of Olmutz. 4. Jacopo is proved not to have gone with Count Philip of Burgundy to the Netherlands in 1506, and there is no proof of his having passed through Nuremberg in the course of that year. Finally, while he pays great deference to his forerunner, M. Ephrussi concludes by saying, in the language of a just and refined amateur, that "Jacopo, malgré la valeur réelle de son œuvre, n'eut jamais une manière absolument personnelle. Il fut inégal, il devait l'être comme tous les artistes qui vivent moins de leur propre fonds que du fonds d'autrui et ont plus d'expérience que d'inspiration." Jacopo was already known to have been, like many other artists of his time, a painter, an engraver, and an enameller. From a bronze plate signed with the caduceus it would appear that he also understood the art of modelling a bas-relief. The subject, cleverly managed, is Orpheus bringing back Eurydice, both nude figures, and almost literal copies of Albert Dürer's *Adam and Eve*. It is a striking example of the mixture of the dry naturalism and mystical mannerism of the two schools, the German and the Italian, which for a moment were so strangely fused together in Venice. M. Ephrussi, in a long note capable of future development into a chapter, demonstrates that up to the middle of the fourteenth century, the Venetian school had been under the dominion of Byzantine art, and traces it through all its modifications up to the appearance of the brothers Bellini. We welcome this work all the more gladly because we know it to be the precursor of others by the same author on Albert Dürer.

PH. BURTY.

NOTES AND NEWS.

We have received from Mr. Alfred Marks a photograph of Leonardo da Vinci's cartoon of the *Virgin and St. Anne* in the Royal Academy. The dark-yellow tone of the paper upon which the original is executed has been unfavourable to the processes of photography, but, in spite of this disadvantage, the result contains such a rendering of all the essential features of the design as could be obtained by no other means. The faces of the two women, set towards one another and combined with a tender and delicate agreement of expression, are perfect in the photograph as in the ori-

ginal, and the faces of the two children are scarcely less satisfactory. Where the photograph partly fails of success is in rendering the outline of the composition as a whole, the tone of the paper tending to darken the background unduly, and to falsify the artist's scheme of light and shade. Mr. Marks has conceived the happy idea of including in the terms of subscription—which, we may say, are remarkably low—a photograph of the original sketch for the composition purchased by the British Museum at the sale of the Galichon collection. The student has thus the means of following the growth of the artist's idea, for, although the cartoon itself is not completely finished, the lines are finally determined, and the faces are carefully elaborated. It is, we believe, the intention of Mr. Marks to publish a short history of the cartoon, which will be very welcome to all students of the master. Although one of the most perfect of Leonardo's works, but very little is known of its fortunes in modern times, and we may mention as an initial difficulty in the way of tracing its history that the Royal Academy have no record of the means by which the cartoon first came into their possession. Another difficulty in the way of the enquirer depends upon the confusion that exists, especially among French writers, between the design of the cartoon and the design of the oil-painting of the *Virgin and St. Anne* in the Louvre. It has previously been pointed out in the ACADEMY that the two compositions are entirely distinct, and, whether the picture in the Louvre be the work of the master or not, it is certain that it must have been a separate effort for which separate studies are to be discovered among Leonardo's drawings. If proof of this were wanting, it might be found in the painting by Luini in the Ambrosian Library at Milan, where the composition of the cartoon in all the main features is precisely followed, with the addition, however, of the figure of St. Joseph in the background. Mr. Marks has discovered—and the fact is interesting as indicating the source of Luini's picture—that the cartoon is stated by Lomazzo to have been in the possession of Aurelio Luini, the son of Bernardino. Arsène Houssaye, in his *Life of Leonardo*, quoting from Rigolot, mentions the existence of a second cartoon, which is said to be in a private collection in Westphalia, and it would be interesting to know how far the two designs correspond.

MR. PELLEGRINI, whose modest signature of "Ape" has been for some time absent from the cartoons of *Vanity Fair*, is likely soon to appeal to the public in another manner of art. He has been for some months residing at Folkestone, where he has devoted himself to the practice of oil-painting, with results that give strong promise for the future. In several studies of peasant life the caricaturist proves that he is able to push his researches beyond the mere obvious truths of individual character; and in all of these portraits we are also able to recognise a certain power in the use and management of colour.

MR. NORTH, the water-colour painter, has recently returned from Algiers, where he has been for some time.

M. GAILLARD, the talented French engraver, whose exquisite plate after Botticelli is to be seen in the Black and White Exhibition, is now engaged upon an engraving after his own painting of *St. Sébastien* in the Salon.

MR. E. J. POYNTER, R.A., head of the Art Department of South Kensington, will preside over the new Art section of the Social Science Congress, which will be held from October 10 to 17 at Liverpool. The special questions include that of regulating street architecture; the influence of Government upon art by the encouragement of mural painting in public buildings; the influence of Academies upon art; and the effect of art as applied to domestic uses, furniture, &c.; besides, voluntary papers are invited bearing upon other branches of the subject.

THE Fine Art Exhibition opened at Wrexham last week is a very satisfactory one. It is especially strong in old plate, particularly that belonging to old corporations of the district. Some of the family portraits by Reynolds, Gainsborough, and Romney are good. The Wilsons are numerous and interesting. The Satsuma and Kioto faience of Major Walker and Mr. Bowes is very fine, and there is a very good display of Wedgwood. Any one passing north will find himself rewarded for staying a day at the pleasant old town, and the church is itself worth a visit. Great judgment has been displayed in what is shown, and also there must have been both discretion and firmness shown in what has been rejected, unless the experience of Major West and Mr. Chaffers differs considerably from that of other organisers of exhibitions. Good taste has marked all the arrangements, and we cannot but hope for a full meed of success for so spirited and excellent a project, so well carried out, which should be most gratefully responded to by the surrounding population, who have not too many opportunities of cultivating their taste for art. We may perhaps return to the exhibition a little later on, when it is completely arranged, to particularise some of the old municipal and family plate.

THE first Congress of the Bristol and Gloucestershire Archaeological Society (now numbering 450 members) is to be opened at Gloucester on Wednesday August 23, under the presidency of Sir W. V. Guise, Bart., who will deliver the inaugural address. The cathedral and other antiquities of the city will be visited, and on the second day excursions are to be made to Tewkesbury and the Saxon church of Deerhurst, to conclude with a visit to Berkeley Castle, &c., on Friday. There will be an opening dinner on Wednesday, and papers are to be read each evening.

WE have much pleasure in announcing that Mr. J. M. Whistler, at the urgent solicitation of some of his friends, is about to return to etching, a branch of his art in which he acquired great distinction, but which he has for some time abandoned in order to devote himself wholly to painting. The keenness with which the few of Mr. Whistler's etchings were disputed which were put up for sale a week or two since at Messrs. Sotheby's shows the appreciation in which he is held by collectors and lovers of art. Mr. Whistler's present intention is to produce a series of twenty etchings of Venice—for which city he is about to start—and these will in all probability be followed at some later period by a second series, made up of studies in Holland and on the banks of the Seine. Only a very limited number of copies will be struck off, and the plates at once destroyed, so that original subscribers will have the satisfaction of feeling that their etchings will by the lapse of time become more and more valuable, and run no chance of being brought into competition with rubbed and debased specimens. At a time when French contemporary engravers are attracting so much attention, and leaving us so much behind in the pursuit of excellence in this special line, the reappearance of Mr. Whistler on a field where he has achieved so many triumphs should not be passed by without a word. Mr. Whistler's perception of beauty in the tones of water, whether expressed in colour or by the burin, is entirely individual; and it will be interesting to observe in what manner this individuality impresses itself upon the characteristics of Venetian scenery, so often rendered by art, but never since the days of Turner by an art so abstract and fantastic as that of Mr. Whistler.

THE next exhibition to be held at the Liverpool Art Club will consist of Illuminated MSS., &c., and will be opened on Monday, October 2. The Committee of Management consists of Messrs. T. Shadford Walker, John Newton, and Edward Quaille. Works of the following descriptions are

eligible for exhibition:—Illuminated MS. Books of Hours, of Antiphonaries, and of Pontificals; Missals, Psalters, Romances, Histories, and Bibles; also, Initial Letters and other Illuminated Cuttings from Choral Books, &c.

THE German Institute at Athens has issued the first of its projected *Mittheilungen* in Greek Archaeology with so much promise as to entitle not only the writers of the articles themselves but also the founders of the Institute to warm congratulation. In this tone of congratulation there has already appeared an article by Prof. Michaelis in the last number of *Im neuen Reich*; but that article, while praising the staff of the Institute, the work it has already done, its scheme of future operations, and its founders, finally runs out into a very serious indictment against the Berlin authorities, who are at once the founders of the Institute and the originating directors of the excavations at Olympia. Why, it is asked, with a staff of highly-qualified archaeologists at Athens, should it have been left for the scholars of Germany to obtain their first criticism of the sculptures found at Olympia from a letter in the *Times* (April 15) by Mr. C. T. Newton, and Prof. Colvin's articles in the *ACADEMY*? At present this is a sore point, and we hope that to heal it the Berlin publication of photographs, and artistic criticism, if necessary, may be no longer delayed. The contributors to the first issue of the *Mittheilungen* are: Köhler, on the Greek Policy of Dionysius the Elder; Th. Mommsen, on the dynasty of Commagene; Lolling, on the topography of Marathon, and on an archaic inscription from near Corinth; and O. Benndorf, with a series of criticisms on the history of Greek art: (1) on the Colossus of Rhodes, (2) on the figure of Lysimache by Demetrios (Pausanias I., 27, 4), and (3) at greater length on the Anadyomene of Apelles.

THE Retrospective Historical Exhibition at present open at Amsterdam, to which we alluded last week, although almost entirely local in its character, yet presents many points of interest to amateurs and students of art of all countries. It has been organised chiefly with the view of restoring, or, perhaps more correctly speaking, *reproducing*, the Amsterdam of olden times, that quaint city of canals and dykes that is so vividly presented to us in the works of the old Dutch masters. With this aim various plans, maps, bird's-eye views, and pictures of Amsterdam at different periods of its history, and numerous models of ancient buildings and monuments, are first exhibited; then follow a series of small primitive-looking figures in bronze, representing certain Counts and Countesses of Holland in the fifteenth century, taken from the ancient *Stadhuis* that was burnt down in 1638, and a goodly number of portraits of Dutch celebrities and worthy burgomasters by such masters as Rembrandt, Van der Helst, Ferdinand Bol, Mierevelt, and others, which afford their personal help to the imagination in reconstructing the times in which they lived. Still further help is given by four rooms—that is, a reception-room, dining-room, kitchen, and bedchamber—which have been furnished exactly in the style of the seventeenth century, with all the little accessory details that could be obtained or reproduced. The church treasures exhibited are very poor in comparison with those at Cologne, the Reformation and the Dutch wars having done effective work in despoiling the churches of Holland; but the treasures and relics of the theatre make a fine show—though the names of Snock, Jan Punt, Anna van Marle and other celebrities of the Dutch stage have more interest, we may suppose, for their countrymen than for uninformed foreigners. Every one, however, has heard of the gallant De Ruyter, and we next come upon a collection of arms, decorations, *bâtons*, parchment deeds and other memorials belonging to him. But the object of most interest to connoisseurs of all nationalities is a relic of the mighty Rembrandt, none other than the original plate of the

celebrated portrait of the Burgomaster Six. This plate, it appears, has remained in the possession of the Six family from the time when Rembrandt delivered it to his kind friend the Burgomaster to the present day, and has always been preserved with the greatest care. It is thought to be the only plate of Rembrandt's that has remained entirely untouched. The catalogue of the Historical Exhibition of Amsterdam forms a volume of 300 pages, but it must be admitted that much of the information it gives is not only uninteresting but often unintelligible to foreigners who do not happen to have studied deeply the past history of Holland. There is plenty, however, in the exhibition, as we have sufficiently indicated, to interest the student and even the casual visitor.

A PICTURE by a young Polish painter named Smieradzki is being much talked about in Rome at the present time. It is called *The Martyrs*, and represents the persecution of the Christians by Nero, as described by Tacitus. It is probable, an Italian journal states, that this picture will be exhibited in Paris before long.

THE Huguier prize of 600 fr. for anatomy at the Ecole des Beaux-Arts has been awarded to M. Perruchot, a pupil of M. Gérôme.

THE German papers state that the objects sent to Berlin from the excavations in Olympia are now being mounted, and will probably be exhibited some time next month in the Museum. It is proposed to restore several of the most mutilated statues of the collection.

ADOLF NORTEN, a battle-painter of some note in the Düsseldorf school, has lately died. His principal works all had reference to the Napoleonic wars, and he is chiefly known by several large paintings of the battle of Waterloo.

A COMMISSION has been appointed by the Minister of Public Works in Paris to enquire into the question of the reconstruction of the Tuileries and of the palace of the Quai d'Orsay. MM. Viollet-le-Duc, Cardaillac, Duc and Reynaud are the four architects attached to the Commission.

THE first stone of a monument to Paul-Louis Courier, designed by M. Viollet-le-Duc, was laid at Vézetz, in Touraine, last Sunday.

THE erratic French artist Gustave Courbet, who has been living at Vevey, in Switzerland, since he was exiled from France on account of the part he took under the Government of the Commune, is said to be organising an exhibition of his works in the country of his adoption. Courbet's pictures are prohibited wares in France—even reproductions of them are not allowed to be sold. This will doubtless make their exhibition in Switzerland all the more popular.

A CORRESPONDENT writes to us:—

"It will be generally allowed that the sole use of a museum, in an educational point of view, consists in having the objects exhibited properly and correctly labelled. This being so, it is matter for great regret that the very reverse should be the case in the otherwise well-arranged Museum of Antiquities in the Guildhall. In a few minutes' examination the other day I observed that all the bronze Celts and a leaf-shaped sword of the ordinary Celtic type are labelled 'Roman,' and a chess-man and two draughtsmen of Scandinavian, Saxon, or Norman make are likewise ascribed to the Romans, while a common clay tripod for supporting pottery in the kiln is placed under a Roman lamp and exhibited as a Roman 'lampstand.'"

AN important work on decorative art entitled *Das Ornament und die Kunst-Industrie in ihrer geschichtlichen Entwicklung auf dem Gebiete des Kunstdrucks* is at present being published in folio parts by the firm of Herr Nicolai, of Berlin. The first number contains twenty-six illustrations from the works of the early German masters, such as Martin and Barthel Schön, Mair von Landshut, Israel van Meckenen, Wohlgemuth, and other engravers, whose names have not yet been resolved, and the examples given enable us to form a very

good idea of the peculiar fantastic ornament, with its lingering reminiscence of the old Scandinavian mythology, that prevailed in Germany in the fifteenth century. The second part, which is not yet out, will deal with the Italian engravings of the fifteenth century, many of the examples being taken from plates that are extremely rare—indeed almost unique. These plates are excellently reproduced by one of the many photographic processes, so that for all practical purposes the copies given have all the value of originals, and industrial artists of all kinds will no doubt find many useful suggestions in them. The work, indeed, is especially designed with a view to the development of art-industry in Germany. The text to the illustrations is written by J. E. Wessely, Keeper of the Royal Cabinet of Prints at Berlin. It is shorter than could be wished, considering the writer's intimate knowledge of the subject. He generally refers students for fuller information to Bartsch and Passavant, books that are not always at the command of the artist workman.

THE STAGE.

"LE BÂTARD."

MONSIEUR TOUROUDE, whose famous piece, *Le Bâtard*, just revived at a Paris theatre, will be seen immediately by many Londoners on their way to the Oberland or the Engadine, was one of those men who present themselves from time to time to contest the supremacy of the accepted masters of their craft. They do work of immense promise, which people busied with these things note and commend—one work, it may be, of immense performance, and for six months the public talks about them. And then it is all over. Every profession knows these men; they are not specially abundant in the profession of literature. Art knows them. They paint a picture which is the talk of dinner-tables, and the new thing at the Academy. It is taken round the country. Mr. Cousens, perhaps, engraves it. All the world subscribes for artist's proofs. It is followed by an inferior work, and again by work hardly noticed at all; and the famous thing itself falls into just that disrepute which belongs to the last fashion but one—the object which has neither the charm of novelty nor the interest of age. The artist has not continued to create. He is a last year's celebrity. The stage itself knows the man. He has drawn the town by a startling performance. He has jumped to the lead in a season. He has made clear

"One point in Hamlet's soul unseen by the Germans yet."

The actors have recognised him. He has gone—as all success goes—to the Crystal Palace to lunch. And then he has absented himself. But in due time he has come back, and the town is occupied with other people's efforts, and it is discovered that his own are less remarkable than was supposed.

Well, M. Touroude was of these men. One day the observers of literary things looked hopefully to his work: the next, the large public had hailed him at the Odéon. The *Bâtard* was triumphant. The public said there was a successor or a rival to Augier, Dumas, and Sardou. Nor did M. Touroude differ largely from the public in that opinion. On the contrary, he was convinced of its truth. Critics pointed out to him the faults of the *Bâtard*—where it was strong, where it was weak. What matter? the public had accepted it. In his subsequent work he repeated its faults, but he did not repeat its merits. He produced other plays, but as far as the popular impression and the critical judgment are concerned—for they both agree—the *Bâtard* is his one drama.

The instinct of a dramatist, so different from that of a novelist, was shown notably in *Le Bâtard*. The story is of the rivalry of two men for a woman's love. They are brothers; the one of them the legitimate and the other the illegiti-

mate son of M. Duversy; but they do not know their relationship. Armand Martin, the elder—the *viveur*—the man whose dishonourable birth has exposed him to associations and misdeeds from which the other has been free, is now enamoured of Jeanne, the young mistress of his brother Robert and the mother of his child. The love of Jeanne is for Robert alone; she cannot listen to the stories to her lover's discredit which Armand Martin, in his desire to succeed him, pours into her ears. It is this that gives rise to the brief passage which proves best of all the dramatic instinct then belonging to the young writer. M. Touroude does not make a violent discussion between the two as to the merits of the absent. Jeanne has heard much, and when she can hear no more she meets the charges neither with argument nor denial, but, with gesture and tones at once of indignation and confidence, utters her lover's name—"Robert! Robert!"—and against the faith expressed in the cry there is no chance for the rival to prevail. This is essentially a dramatic moment; a situation conveyed by a couple of words with which a born dramatist alone can entrust a born actress. It shows the capacity of the one, and tests the capacity of the other. At the Odéon, seven years ago, the actress was found equal to the task; but the actress then was Mdlle. Sarah Bernhardt, who made her fame almost by that cry, and could make it because she brought already there what she has since been more generally recognised to bring to every part—the rare power to understand it, and the emotion proper to it in life, and not the mere conventional expression of it on a stage stifled by tradition. It is the mistake of Mdlle. Lacressonnière, who now plays the part at the Porte Saint Martin—whence from the Odéon the drama is transferred—that she shows too soon by violence and emphasis the way in which Jeanne resents all that is poured into her ears, and she has no means left whereby to express at the one moment how she loathes the attack and revolts from it. The one artist has seen further and deeper than the other.

It is only late in the play that the intention of the author to call out sympathy for the Bastard becomes apparent. Robert has thus far had the audience with him, and M. Touroude is not quite successful in turning it at the last. For a certain detailed truth to nature he has sacrificed the abstract truth one looks for at the theatre. Robert has, indeed, lived with Jeanne, and had a child from her. He pleads with his father that he may marry her. The father remonstrates with him. "Cris-tu," he says, "qu'après avoir oublié ses devoirs de vierge, elle ne foulera pas aux pieds ses devoirs d'épouse?" But Robert's mother is there, and she does from tenderness what the Madame Aubray of Dumas would have done from conviction. Jeanne is to be received. But, the struggle waxing hotter between Robert and Armand, and a fight being now imminent, with fratricide for the result of it, the elder M. Duversy tells Armand that he, like Robert, is his son. And to the end the Bastard suffers his fate. It is M. Touroude's aim to show him as the heir to vice and misfortune.

The actor Faillie is, on the whole, as good as was Laray of old in the part of the father, which is after all small, though containing one or two scenes of remarkable significance. But Paul Deshayes, an actor of melodrama, cannot give to the character of Armand the distinction which belonged to Berton. Just as Sarah Bernhardt helped the author in the one great scene of which we have spoken, so did Berton help the author throughout the whole course of the play. He won for Armand an earlier sympathy than the author's work unaided could have given him. Fabregues, a young man said to be from the south, now takes the part of Robert, which, like that of Jeanne herself, must be sympathetic whether it is meant to be or not. And he brings to it something of the warmth of manner and sonority of voice which Berton the younger found

valuable in the part, but hardly all the chivalrous tenderness which made Pierre Berton here so specially good. FREDERICK WEDMORE.

MR. TOOLE's fifteen nights' engagement at the Gaiety Theatre has not been thought sufficiently important to be made the occasion for the performance of a new part. *Off the Line*, the *Spelling Bee*, and *Ici on parle Français* make a liberal programme—liberal enough to draw many London and provincial playgoers to these familiar representations. The spirits of Mr. Toole suffer no abatement, and his power over his audience is all that it has been wont to be.

London Assurance is one of two or three comedies which may conveniently be played at any moment when other pieces have failed, but the merit of the comedy itself being granted, the importance of its performance must be allowed to depend on the care with which it is presented, and the general efficiency of the cast. This week *London Assurance* has been seen at the Haymarket, but it has not been seen under favourable conditions. The minor characters are but poorly played, and the chief ones not very happily. Miss Hodson, though an intelligent Lady Gay Spanker, has not the special gifts of demonstrative vivacity which the part wants. Neither Mr. Howe nor Mr. Harcourt—respectable, indeed, as they are—are the best representatives of the parts they play. Mr. Conway, again, is not seen at his best.

MR. EDWARD TERRY, who leaves the Strand, takes a benefit there to-day, and this evening Mrs. Swanborough will have her annual benefit at the same theatre. Miss Jennie Lee will appear at the benefit of Mrs. Swanborough.

MR. H. J. MONTAGUE leaves England for America to-day. He was to make his only appearance in England before his return to the United States at Miss Amy Fawcett's benefit at the Vaudeville on Thursday.

THE Globe Theatre opens to-night for a series of performances in which Mr. J. A. Cave, Miss Lynd, and Miss Pauline Markham are announced to take part. The representations of Mdlle. Beatrice came to an abrupt termination at this house.

THIS evening *Our Boys* reaches its 500th representation at the Vaudeville Theatre.

MR. HARE and his company are leaving town to fulfil engagements in the country.

MR. MOY THOMAS's novel, *A Fight for Life*, has been dramatised, and Mr. Lyn Rayne has organised a company for its representation in the provinces.

THE annual contest for prizes for recitation in tragedy and comedy was to take place at the Paris Conservatoire late in the present week. The number of competitors for the prizes in comedy was, as may be expected, much in excess of the number competing in the department of tragedy. The competition, of which we shall probably be able to give some account in our next, is always an affair of great interest to all theatrical people in France. Two or three new engagements at the Français and the Odéon immediately result from it.

MUSIC.

WAGNER'S "RING DES NIDELUNGEN."

(Second Article.)

THE *Rheingold*, of which an account was given last week, though closely connected with the works which follow, and necessary for their complete understanding, may still be regarded rather as a prologue than as a constituent portion of the actual drama, which latter consists of the three parts entitled respectively *Die Walküre* (The Valkyr), *Siegfried*, and *Götterdämmerung* (The Waning, or Dusk, of the Gods).

It will be as well to commence our notice of *Die Walküre* with an explanation of the name itself. It is derived from two old German words: *Wal*, those slain in battle, and *küren*, to select. Walküren were daughters of Wotan, whose duty it was to bring slain warriors into "Walhalla"—the Hall of Warriors. The word *Wal* is frequently employed by Wagner both in its simple form and as a compound; in addition to the examples already given, we find in the present drama Wotan frequently spoken of as "Walvater."

The connexion between the *Rheingold* and *Die Walküre* does not become apparent until we reach the second act of the latter. It will be more intelligible to our readers, however, if we say a few words about it here. Between the action of the two, an interval of many years is supposed to have elapsed. It will be remembered that Wotan had stolen the ring from the Nibelung Alberich, who had thereupon solemnly cursed it; it had not been restored to the Rhine-daughters, but given to the giants in payment for the building of Walhalla. Fafner, one of the giants, had killed his brother, and taken the treasure, the Tarnhelm, and ring for himself. We learn that Alberich's curse and Erda's warnings had powerfully impressed Wotan, who went to the goddess for further tidings. From her he learns that if the ring should ever return to Alberich's hands Walhalla would be lost; but, as Wotan is allied by treaties with the race of giants, he himself is powerless to regain what he has given. Only a hero who, acting for himself without the help of the gods, should conquer the giant Fafner and obtain the ring can save the deities. Fafner has, by means of the Tarnhelm, assumed the form of a gigantic serpent, and guards the hoard and the ring. Wotan, under the name of Wälse, visits the earth and begets two children—a son, Siegmund, and a daughter, Sieglinde. In the former their father hopes for his deliverer; and it is the fortunes of the pair which we shall follow in the present drama.

In order to harden Siegmund for future exploits, Wotan had stirred up against him the race of the Neidings, who had carried off his sister, Sieglinde, and married her by force to Hunding, one of their kinsmen. The first act of *Die Walküre* passes in Hunding's house—a curious dwelling built under a large ash-tree, the stem of which supports the roof, and occupies the middle of the room. Siegmund enters from without, where a storm is raging; he is a fugitive, has lost his arms in combat, and, weary almost to death, throws himself on the hearth and faints away. Sieglinde enters from an inner room, supposing her husband to have returned, and is surprised to see a stranger; for brother and sister have so long been separated that neither recognises the other. Yet an inexplicable sympathy at once unites the pair. She brings him water, and in reply to his enquiries tells him she is Hunding's wife. He, however, merely knew that his sister had been carried off, but was not aware of her subsequent fate. Hunding enters, and a long conversation ensues, of which only the briefest abstract can be given. In answer to Hunding's questions, Siegmund tells what he knows of his own history, and gives his name as Wehwalt, for that misfortune constantly pursues him. He further says that he lost his weapons in defending an unfortunate maiden, whose relatives were marrying her against her will. Hunding hereupon declares himself a kinsman of those with whom Siegmund had been fighting. "My house protects thee to-night. To-morrow arm thyself with stout weapons; thou payest me for the dead." He retires into his bedroom with his wife, and Siegmund is left alone. The room is now dark, save for the fitful light from the dying embers of the fire. Siegmund recollects how his father had promised that he should find a sword in the hour of his deepest need. The fire suddenly brightens up for an instant, and its light shows clearly the handle of a sword projecting from the trunk of

the ash-tree. The flame dies out again; the door of the inner chamber opens gently, and Sieglinde appears. She has drugged her husband's drink, and is come to save the stranger. She shows him the sword-hilt in the stem, and tells him how at her wedding-feast an old man had entered with a sword in his hand, which he had thrust into the tree, declaring that it should belong to him alone who could draw it out. All the wedding-guests tried; but none could move it an inch. Then Sieglinde recognised her father in the old man, and knew for whom alone the sword was intended. After a long and most passionate love-scene, Siegmund declares himself by his true name, draws the sword with a mighty wrench out of the stem, and gives it the name of "Nothung," at the same time saluting Sieglinde as "sister and bride;" they throw themselves into one another's arms, and the curtain falls.

Whether this repulsive detail of the plot is due to Wagner himself or (as certainly seems more probable) to the old legend, I am unable to say. It destroys all sympathy for the guilty pair: and when we subsequently find them paying a heavy penalty for their crime it is impossible not to feel that they have only got their deserts. In the second act of the drama we see how Divine vengeance follows the culprits. The scene of this act is a mountain height. Wotan and his favourite daughter, Brünnhilde (*the Walküre* who gives her name to the drama), are seen in full armour. Wotan, whose morality appears to be of the loosest description, orders Brünnhilde to give the victory to Siegmund in his approaching combat with Hunding. She departs to execute the commission, but returns to tell Wotan to prepare for a conflict himself, for that his wife, Fricka, is approaching, and that a storm is evidently brewing. Fricka enters, and, as the guardian of the marriage-vow, demands from her husband vengeance upon the pair who have transgressed. Wotan, with astounding coolness, asks "What have the pair done that is so bad?" and Fricka indignantly asks her how she is to expect regard for the marriage vow from him, whose conjugal infidelities were notorious. Wotan endeavours to explain to her the necessity for a hero who shall deliver the gods in their need; but she insists that the gods will be the scorn of men if in this instance her honour be not upheld. At last she obtains from Wotan an oath that Siegmund shall fall. Brünnhilde is summoned to hear the decision; she is horror-struck, for she knows that Wotan loves Siegmund. She endeavours in vain to change his purpose, but he dares not relent, and she must obey. Wotan departs, and Brünnhilde, seeing Siegmund and Sieglinde approach, retires behind a rock. Sieglinde is overwhelmed with remorse and despair, and her brother in vain attempts to console her. Brünnhilde solemnly advances, and in a scene of the most exquisite pathos announces to Siegmund his approaching death; he must follow her to Walhalla. He enquires whether Sieglinde will be there, and, being answered in the negative, declares that he will not go. Brünnhilde tells him that the lot is given against him; he trusts to his victorious sword, but she replies that he who charmed it has taken away its charm. She offers to take Sieglinde under her protection; but Siegmund will let none but himself be her guardian, and, rather than leave her, he draws his sword to pierce her heart. Brünnhilde in an agony of sympathy then takes upon herself to reverse Wotan's sentence, and promises victory to Siegmund. Hunding's horn is heard from a distance, and in the fight which ensues, Brünnhilde is seen hovering over Siegmund, and covering him with her shield. As he is about to strike Hunding a deadly blow, Wotan appears in a cloud above, and interposes his spear. Siegmund's sword is shattered against the spear, and Hunding pierces him to the heart. Brünnhilde hastily carries off the fainting Sieglinde, and Wotan with a gesture of contempt says to Hunding, "Begone, slave! kneel before Fricka; tell her that Wotan's

spear has avenged her injuries. Go!" At these words Hunding falls dead on the ground. Wotan then in a terrible rage turns to pursue his disobedient daughter.

The third act opens with the celebrated scene of the "Walküren-ritt," the music of which has frequently been played at concerts in Germany. The Walküren are mustering in stormy weather on the top of a mountain. By the gleam of lightning flashes we see them gather one by one, each in full armour and on horseback, with a slain warrior hanging over her saddle. Brünnhilde enters hurriedly, bringing with her the half-unconscious Sieglinde. She hastily informs her sisters of what has occurred, and begs for their help. None, however, will aid her in disobeying Wotan. Sieglinde begs Brünnhilde to kill her now that Siegmund is dead, but Brünnhilde tells her to live for the sake of the child she is to bear. The instinct of the mother awakes; she implores protection for herself and her child. There is, however, but one place of safety for her—the forest where Fafner guards the Rhine-gold and the ring, and which, on that account, Wotan shuns. Thither Sieglinde is directed. Brünnhilde tells her that she bears in her womb the noblest hero of the world; she gives her the broken pieces of the sword Nothung; he who wields it afresh and wields it shall receive the name "Siegfried."

Sieglinde departs, and Wotan approaches in a thunder-storm. The Walküren in vain try to appease his wrath against Brünnhilde. He pronounces her sentence; no longer shall she be his "Wunschknecht," to fulfil his wishes; no longer a Walküre: she shall become a mere woman; she shall be cast into a defenceless sleep, and whoever finds her and wakes her shall have her. Her sisters fly from the place affrighted. Brünnhilde entreats her father to surround her with fire, so that only the bravest hero of the world may dare to wake her. The god at length relents, and after a most beautiful farewell scene he closes her eyes in sleep, covers her with her large shield, and summons Loge, the fire-god. Flames break forth which cover the stage, and with the words "Let him who fears the point of my spear never pass through the fire," Wotan slowly departs, looking back regretfully from time to time at the daughter whom he is leaving for ever.

With a true poet's feeling for contrast, Wagner, after the sustained passion and tragic earnestness of *Die Walküre*, gives us in *Siegfried*, the next part of the drama, what a German critic has very happily described as a "heroic comedy." Of this portion of the work it is even more difficult than of the preceding to give any adequate account within reasonable limits, because its interest arises less from its incidents than from the delineation of character. Sieglinde had wandered away to the forest to which she was directed by Brünnhilde; there she had been found in the pangs of labour by Mime, the old Nibelung, the brother of Alberich, with whom we have already made acquaintance in the third scene of the *Rheingold*. The mother had died in childbirth, committing her infant son, Siegfried, to the care of Mime, and giving him the broken pieces of the sword Nothung. At the commencement of the present drama Siegfried has grown to a sturdy youth, fearless, open-hearted, and full of merriment; and the contrast between him and the wily old dwarf, who has reared him with the hope of inducing him to kill Fafner, that he (Mime) may obtain the ring, is admirably developed in the first act. The scene of this act is the cavern in which Mime and Siegfried live. Mime is working at an anvil to forge a sword for the youngster, and grumbling that he can make nothing strong enough. Siegfried rushes in from the forest with a great bear which he has caught, and with which he chases Mime round the cave, crying "Ask for the sword, Brownie!" and laughing at the old dwarf's fright. Mime declares that the sword is ready, whereupon

Siegfried releases the bear, which runs out. The sword, however, proves to be worthless, and breaks at the first trial. Siegfried asks Mime for information as to his parents, and with much difficulty learns from him what he wants. The Nibelung shows the lad the broken pieces of his father's sword, and Siegfried declares that to be the only weapon for him, and orders Mime to repair it at once. This task is too heavy for the dwarf, who has often attempted it in vain. Siegfried goes into the forest again, and leaves Mime lamenting the impossibility of doing what is required. Wotan, as "the Wanderer," enters the cave; and a very interesting scene follows, which it is impossible to condense, and for which, therefore, readers must be referred to the poem itself. At the end of it the Wanderer informs Mime that "only he who has never known fear shall forge Nothung afresh," and that the dwarf's life is forfeit to him who knows not fear. Mime is now, to use his own expression, in a "cursed fix" ("verfluchte Klemme"); he is aware that Siegfried is he who knows not fear, and, therefore, that unless he can teach it to him, his head must fall: on the other hand, none but a fearless one can slay Fafner, and obtain the ring. He resolves to have recourse to cunning, and to poison the youth after he has slain the dragon. Siegfried returns, and finding Mime unable to forge the sword, resolves to do it himself; the scene of the forging occupies the remainder of the Act. He succeeds, as will be anticipated, and, swinging the sword joyfully, calls out, "Look, Mime; this is how Siegfried's sword cuts!" and with one stroke cleaves the anvil from top to bottom.

The second act takes place in the forest, at the entrance of the cave in which Fafner guards the Rhine-gold and the ring. It is night; and Alberich is watching the cave. To him enters the Wanderer; impelled by anxiety as to Siegfried's success, he also has come thither to ascertain how matters stand. His hopes of finding a deliverer in Siegmund have failed; for he had himself assisted his son, whom he had provided with a sword, as was seen in *Die Walküre*. However anxious, therefore, he may be for Siegfried's victory, he will not afford him the least aid; and, to the astonishment of Alberich, he not only disclaims all designs upon the ring, but warns him of the machinations of his brother Mime. Wotan retires; and as day breaks Alberich withdraws into a cleft of the rock. Mime and Siegfried appear; the former points out the dragon's cave, and leaves the youth to await the approach of the monster. Left to himself, Siegfried listens to the sounds of nature, the rustling of the woods and the singing of the birds. Fafner, in the form of an enormous snake, comes out of the cavern, and in the fight that ensues is mortally wounded by Siegfried. With his dying breath he tells the lad his history, and warns him to beware of the dwarf. As Siegfried draws his sword out of the corpse, his hand is moistened by the dragon's blood, which burns like fire; involuntarily he puts it to his mouth, and the taste of it enables him to understand the song of a bird in a tree above him. The bird tells him to go into the cave and take the Tarnhelm and ring. Siegfried obeys; and the bird then bids him beware of Mime, and says that the blood of the dragon will enable him to understand the dwarf's real intentions. Mime reappears, and a most comical scene ensues, in which, in spite of himself, he tells Siegfried that he means to kill him. In the most affectionate tone he assures him that he has always hated him, and that, if he will only taste the drink he has prepared, he will soon be unconscious, and that then he will merely cut his head off. As he becomes more and more importunate, Siegfried raises his sword, and with one blow lays him dead at his feet. Alberich's mocking laugh is heard from his hiding-place. The bird then tells Siegfried that he knows of a charming wife for him; but that she is protected by fire, and "only he who knows not

fear" can find her. Siegfried declares himself to be the fearless one; the bird hovers over him, and then flies off, the lad hastily following.

The third act can be very briefly dismissed. At its commencement the Wanderer is guarding with his spear the path to Brünnhilde's rock. He summons Erda from the earth, and asks for further advice; but her wisdom avails him not, and he sentences her to return to everlasting sleep. Siegfried approaches, led by the bird, which, on seeing Wotan, flies off affrighted. Wotan forbids him to pass, for he knows that who wakes the slumbering maiden will render the gods powerless for ever. The fearless Siegfried, however, will not be denied, and with a stroke of his sword cuts in half Wotan's spear. The god quietly picks up the pieces, and saying, "Go on! I cannot stop thee!" vanishes. The scene changes to the mountain summit seen in the third act of *Die Walküre*. Brünnhilde is lying asleep under her shield. Siegfried comes through the flames, and in a fine scene, of which it is hopeless even to attempt an abstract, wakes her. With their mutual declaration of love this portion of the work closes.

EBENEZER PROUT.

THE distribution of prizes and certificates at the Royal Academy of Music took place yesterday week in the new concert-room of that institution. The Principal, Prof. Macfarren, delivered an address on the past history and present position of the Academy, which, as the recent concerts of its students have shown, is in a high state of efficiency, and the prizes were given by Mdme. Christine Nilsson.

It is reported that the Sacred Harmonic Society contemplates next year giving performances of secular and instrumental music in addition to the oratorios with which its name and fame are associated. The wisdom of such a modification in its arrangements seems somewhat doubtful. Those works which produce the greatest effect at the Society's performances are unquestionably the oratorios of Handel; because this composer's music is so broad in character and so simple in its details that it will bear any addition of power, not only without detriment, but with positive gain. But the very large majority of modern compositions—such, for instance, as Beethoven's "Choral Symphony" and Mendelssohn's *Walpurgis Night*, which have been named as among the works which may possibly be given—stand on a totally different footing. Here much depends on the due proportion of the constituent parts of the orchestra, and on the relative strength of band and chorus. Without intending any disparagement either of the Society or of its conductor, it may fairly be said that to balance such a chorus as that which sings at Exeter Hall, in the performance of music in which the voice-parts are not (as with Handel) the most important factors of the music, so large an orchestra is required that the wind should be at least doubled if the strings are not unduly to predominate. If this be done many of the effects are altogether changed; if not, many are altogether lost. In the one case coarseness, in the other a caricature results. For the adequate presentation of such music a band and chorus of only moderate size is much more fitted than the "700 performers" of the Sacred Harmonic Society—a Handelian force *par excellence*.

LAST week a rehearsal was given at St. George's Hall of Mr. J. F. Barnett's *Lazarus*, composed by him for the Hereford Festival, which will take place two months hence. The work is reported to be highly interesting.

THE great event at the approaching Birmingham Festival will undoubtedly be the production of Prof. Macfarren's Oratorio, composed expressly for that occasion, and entitled *The Resurrection*. This work is already completed with the exception of the overture, and its construction, it is under-

stood, will present some novel features. The whole of St. John's account will be recited by Mr. Santley, and this will be interspersed with solos and choruses, including hymns, commenting on the various points of the story.

THE Balfé Memorial performance at the Alexandra Palace to-day is likely to be specially attractive. The *Bohemian Girl* is to be performed, and Mr. Weist Hill will conduct. Mr. Carl Rosa and his company, whose appearance had been announced for this occasion, somewhat suddenly withdrew, and the incident might have caused a serious hitch in the arrangements; the ready consent, however, of popular singers to fill up the vacancies thus left effectually prevented any really serious inconvenience. The proceeds of to-day's performance will be devoted to the endowment of a Balfé Scholarship at the Royal Academy of Music.

VERDI'S *Aida* has been lately produced at the Malibran Theatre at Venice, the principal parts being sung by Mdmes. Mariani and Waldmann, and Signori Masini, Pandolfini, and Medini. Owing, it is said, to the heat, the attendance was not very large.

A NEW contralto singer, Frl. Rosa Bernstein, has lately made her first appearance at the Leipzig Theatre with great success, as Azucena in the *Trovatore*. The lady was formerly a pianist at Vienna, but, it having been discovered that she possessed a fine voice, she gave up playing and turned her attention to the stage. We understand that she is contemplating a visit to this country.

ON the 8th inst. died, at Mödling, near Vienna, Joseph Dessauer, at the age of 78. He was a pupil of Tomaschek and Dionys Weber, and the composer of many popular German songs. The *Musikalisches Wochenblatt* states that he has bequeathed to the Mozarteum at Salzburg the autograph scores of Mozart's *Don Giovanni* and of the first version of Beethoven's *Fidelio*, which were in his possession.

SAMUEL TINSLEY'S

NEW PUBLICATIONS.

YE OUTSIDE FOOLS; or, Glimpses

Inside the Stock Exchange. By BRASMUS PINTO, Broker. Crown 8vo, 7s. 6d.

Public Opinion says:—"Written in a clever, cynical, and incisive style, and thoroughly exposes the rigs and tricks of the Stock Exchange. One advantage of a personal will be that those who allow themselves to be plundered will do so quite consciously. The volume as a whole is extremely interesting."

OUR INDIAN EMPIRE: the His-

tory of the Wonderful Rise of British Supremacy in Hindustan. By the Rev. SAMUEL NORWOOD, B.A., Head Master of the Royal Grammar School, Whalley. 1 vol.

ITALY REVISITED. By A.

GALLENGA (the Times Correspondent), Author of "Italy, Past and Present," "Country Life in Piedmont," &c. 2 vols. demy 8vo, 30s.

The Times says:—"Mr. Gallenga's new volumes on Italy will be welcome to those who care for an unprejudiced account of the prospects and present condition of the country.....Most interesting volumes."

The Spectator says:—"The two volumes abound in interesting matter, with vivid sketches of places and persons."

POPULAR NEW NOVELS,
AT EVERY LIBRARY.

SECOND EDITION of JABEZ

EBBLEIGH, M.P. By Mrs. FILOART, Author of "The Curate's Discipline," "Meg," "Kate Randall's Bargain," &c. 3 vols. 31s. 6d.

MADAME: a Novel. By Frank Lee

BENEDICT, Author of "Miss Dorothy's Charge," "St. Simon's Niece," &c. 3 vols. 31s. 6d.

THE DAYS of HIS VANTY. By

SYDNEY GRUNDY. 3 vols. 31s. 6d.

The RING of PEARLS; or, His at

Last. By JERROLD QUICK. 2 vols. 21s.

GILMORY. By Phoebe Allen. 3 vols.

31s. 6d.

LLANTHONY COCKLEWIG: an

Autobiographical Sketch of his Life and Adventures. By the Rev. STEPHEN SHEPHERD MAGUTH, LL.B. Cantab. 3 vols. 31s. 6d.

THE MASTER of RIVERSWOOD. By

Mrs. ARTHUR LEWIS. 3 vols. 31s. 6d.

The New Quarterly Review says:—"We have barely space to express our admiration of this novel, and our belief that it must achieve more than passing popularity.The latest novel of the quarter is the best."

The Standard says:—"The Master of Riverswood" will, therefore, soon become a favourite with all who relish and enjoy a good style, a well-contrived plot, and a sound moral."

PENELOPE'S WEB: a Story. By

LOUIS WITHERED. 3 vols. 31s. 6d.

TOO FAIR to GO FREE. By Henry

KAY WILLOUGHBY. 3 vols. 31s. 6d.

SAMUEL TINSLEY, 10 Southampton Street, Strand.

Now ready, small 8vo, cloth, 6s. 6d. post free.

AN ENQUIRY into the NATURE and RESULTS of ELECTRICITY and MAGNETISM. By AMYCLANUS. With a Map and several Diagrams.

London: R. WASHBOURNE, 18 Paternoster Row.

THE OCEAN, its Tides and Currents and their Causes. By WILLIAM LEIGHTON JORDAN, F.R.G.S.

In 8vo, with 12 Plates, price 21s. cloth.
"A very valuable addition to the list of works advancing our cosmical knowledge."
"The Author of this book gives us a new Principia. Still, the book is the production of a man thoroughly well up in his own subject, and many others collateral with it. It is one that may be safely commended to the study of all who are interested in the subject of ocean currents."
"Here we have the vulnerable point of Dr. CARPENTER's modified resuscitation of the old theory of oceanic circulation clearly indicated, and a home-thrust of clear, sound reasoning fairly delivered through it. As this point is the very heart of Dr. CARPENTER's contribution to the subject, the thrust is fatal. It is followed by further and equally clear and able discussion of the details of Dr. CARPENTER's arguments, and of the theories of MAURY, RENNELL, HENSEL, &c. This Chapter of Dr. JORDAN's book is really excellent, and worthy of careful reading."

Quarterly Journal of Science.
"The reports received from Her Majesty's Ship Challenger have confirmed the views expressed in this work with a distinctness exceeding the most sanguine anticipations of the Author."

London, LONGMANS & Co.

THE SEAT of WAR in TURKEY in EUROPE.

Just published, with Map and 58 Illustrations, price 18s.
THROUGH BOSNIA and the HERZEGOVINA DURING the INSURRECTION, in August and September, 1875. By ARTHUR J. EVANS, B.A., F.S.A.

"A work which at the present time no intelligent Englishman can overlook."
"This is an opportune publication, of much interest at present in connexion with the Servian rising."
"This interesting and ably written book could not have appeared at a more opportune moment."
"This is a most opportune, and instructive book of travel that have been published for some time."
"A most interesting volume, and its publication at the present time is exceedingly opportune, as it gives information which may be relied on, accompanied by excellent engravings and woodcuts."

"This well-written, interesting, and reasonable book discusses the north-western districts of Turkey in a scholarly and lucid style, with the pen of a competent writer, to whom description is clearly no hard or irksome task, and who displays judgment and original thought in the exercise of his literary calling."
London, LONGMANS & Co.

THE NEW HANDBOOK for the TYROL.

With Frontispiece and 3 Maps, 12s. 6d.

THE VALLEYS of TIROL. By Miss R. H.

BUSK, Author of "Folk-lore of Rome," &c., &c.
"To those who have wearied of the common tracks Miss Busk points out a promised land."
"She has a true traveller's—as distinguished from a mere tourist's—intuition.....Opens up a large and clear vista of the Tyrol."

"Will be a pleasant companion to the tourist."
"We heartily concur with Miss Busk's protest against calling Tirol, 'the Tyrol.'"
"Will help travellers to interest themselves in one of the most remarkable portions of Europe."
"Her style is fresh and pleasant."
"Lively sketches of the social life of Tirol."
"Something to interest everybody."
"Folk-lore and description are delightfully blended."
"A very complete handbook."
"A very good guide."
"A pleasant description of her wanderings."
"A most agreeable travelling companion."
"Charming reading."
"She treats the reader to what may be termed a dramatic tour."

London, LONGMANS & Co.

Fourth Thousand now ready, in 8vo, price 12s., cloth.

THE LONDON UNIVERSITY COURSE of

MATHEMATICS, containing an Outline of the Subjects in Pure Mathematics included in the Regulations of the Senate for the Matriculation and Bachelor of Arts and Bachelor of Science Papers Examinations; with the entire Series of Mathematical Papers set by the University from 1838 to 1875. By THOMAS KIMBER, M.A. Lond., late Master of the Haberdashers' Company's School.

KEY to the Matriculation Course, price 5s.

KEY to the B.A. & B.Sc. Course, price 5s.

London, LONGMANS & Co.

Just published, in 8vo, price 3s. cloth.

HISTORY of LANDHOLDING in ENGLAND. By JOSEPH FISHER, F.R.H.S.

"Pertinent and just."
"Traces the system with a clearness which will be found valuable."
"Abounds with much learning."
"Is a model of conciseness and accuracy."
"An able and important book."
"Of considerable value."
"Will be found especially interesting."
"Interesting and valuable."
"Of great historical interest and usefulness."
"Most able and interesting."

London: LONGMANS, GREEN, & Co.
Dublin: W. H. SMITH & SON, and their Bookstalls.

THE LIFE and REIGN of EDWARD I.

By the Author of "The Greatest of the Plantagenets."
"Truthful, honourable, temperate and chaste, frugal, cautious, resolute; great in counsel, ingenious in contrivance, rapid in execution; he had all the powers of Henry II. without his vices; and he had, too, that sympathy with the people he ruled which the want of which alone would have robbed the character of Henry II. of the title of greatness."
"The best of our kings."
"Professor Stubbs, Constitutional History, vol. II."
"Edward stands forth as the greatest name among our later kings."
"In him we had a king indeed. A king to rule with wisdom, valour, and goodness.....A king who, on the throne of England, made the welfare of England the object of his life."
"The last of her royal lawgivers; the noblest of her royal conquerors."
"Freeman's 'Norman Conquest,' vol. v.
SERLEY, JACKSON, & HALLIDAY, 54 Fleet Street.

SATURDAY, AUGUST 5, 1876.

No. 222, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

History of Merchant Shipping and Ancient Commerce. By W. S. Lindsay. (London: Sampson Low & Co., 1874-1876.)

Two more volumes have been recently published, which complete Mr. W. S. Lindsay's interesting and instructive *History of Merchant Shipping and Ancient Commerce*. We have already given some account of that portion of the work which treats of Ancient Commerce, which may properly be said to terminate with the first expedition of Columbus in 1492, when, trusting to the mariner's compass and the astrolabe as improved by Martin Behaim of Nuremberg, the great Genoese navigator struck boldly across the Atlantic, and succeeded in reaching the frontier islands of a new world after seventy-three days of unceasing conflict with the perils of an unknown sea. Mr. Lindsay has also not omitted to do justice to the memory of our countryman Sebastian Cabot, of whom the ancient city of Bristol may well be proud, as being the undoubted discoverer of the continent of North America in 1498, his father, Juan Cabot, and himself having discovered Prince Edward's Island and Nova Scotia in their voyage of the previous year under the first letters patent of King Henry VII. Mr. Lindsay, however, seems inclined to antedate the voyage in which Sebastian Cabot reached as high as 67° N.L., but the weight of evidence, we think, is in favour of the view that he reached that high latitude in his subsequent voyage of 1517. It is not, however, only as the discoverer of the continent of North America that the claims of Sebastian Cabot to the gratitude of his countrymen have been upheld by Mr. Lindsay. Sebastian Cabot originated "the Association of the Merchant Adventurers," which broke down the monopoly of the German merchants of the Steel-Yard, and he planned the first expedition, under Sir Henry Willoughby and Thomas Chancellor, into the North Sea, which found its way to the coast on which the town of Archangel has since been built, and thereby opened a direct commercial intercourse between Russia and England. Mr. Lindsay has also not omitted to notice the earliest establishment of a permanent Royal Navy in England by King Henry VIII., and the discomfiture of the great Spanish Armada of Philip II. by a collective English fleet, of which the greater part were private ships, either fitted out in compliance with the Crown's right of Maritime Conscription, or supplied voluntarily in excess of the number required by the Queen's edict.

"Though the defence," says Mr. Lindsay, "ap-

peared to be hopeless, the feeling of despair seems never to have entered the minds of the English people, who, with one accord, made the most strenuous efforts to meet the apparently overwhelming force. London, ever foremost in its loyalty, furnished Elizabeth with large sums of money, the citizens rivalling with each other in the amounts they raised, and furnishing double the number of ships and men required by the Royal edict. The same patriotic view pervaded the whole of the country, especially the sea-port towns and the merchant marine" (vol. ii., p. 145).

It is well that we should be reminded by the history of past dangers of the constitutional resources of which the Queen's Government may at any time avail itself to repel any threatened invasion of England, and to which the Declaration of Paris of 1856 has in no respect debarred England from having recourse in any great emergency of war. The Maritime Conscription is as fundamental an element of the English State-Constitution as the Military Conscription is of the Continental State-Systems, and England is in no way debarred by the Declaration of Paris from calling out her Merchant Marine in time of war, and placing it under properly commissioned commanders as a force auxiliary to the Queen's ships. What England has renounced under that Declaration is the practice of granting "letters of marque and reprisal" to the subjects of foreign States as well as to her own subjects, which has given countenance to a species of marauding on the high seas out of keeping with the civilisation of the present day. Mr. Lindsay has given a graphic sketch of the excesses to which the ancient practice of "letters of marque" gave rise in the seventeenth century.

"Nor did they," he says, "confine themselves to depredations at sea. Some of the crews of the more daring cruisers harassed the Spanish coast, sacking villages, plundering mansions, pilfering churches and convents, and had, moreover, the audacity to drink success to piracy out of the silver sacramental vessels which they had stolen. If not in all cases furnished with the Queen's Letter 'to burn, plunder, and destroy,' they too frequently exercised that calling, and if ever England was justified in 'claiming the Dominion of the Narrow Seas,' she had at no period of her history greater claims to it than when these freebooters in vessels of every kind poured forth from her ports and scoured the English Channel like a flock of locusts, an eternal disgrace to the name they bore, and to the flag under which they had been launched for peaceful purposes on the ocean" (vol. ii. p. 140).

England witnessed the reverse of the medal in the latter part of the last century, when the British Channel swarmed with French cruisers sallying forth with the tide from every petty port of Normandy and of Brittany, and preying upon British commerce under colour of letters of marque issued to them by the Government of the United States of America, the independence of which States had not been yet recognised by Great Britain, while Great Britain was still nominally at peace with France.

Mr. Lindsay has passed in review the English voyages of discovery of the eighteenth century: Dampier, one of the most daring of the Buccaneers and the first English explorer of the coast of New Holland and of New Guinea; Anson, famous for his cruise in the *Centurion* round the world; Byron, who made the first careful survey

of Magellan's Straits, and who was wrecked in the *Wager* on the coast of Chili; Wallis, who first gave an account of Otaheite, and Carteret, who discovered Pitcairn's Island; and last but not least of all, Captain James Cook, who was despatched in 1768 with Sir Joseph Banks and Dr. Solander to Otaheite to make an observation of the transit of the planet Venus across the disk of the sun, and in the same voyage afterwards discovered New Zealand and New South Wales, and who in his third voyage of discovery along the western coast of North America passed into Behring's Straits, and reached as high as 70° 44' N.L., "where his further progress was completely barred by a wall of solid ice."

Mr. Lindsay has devoted his third volume exclusively to the modern history of merchant shipping, having introduced the subject already in the latter part of his second volume, and he has brought together a large amount of varied and valuable information in a very agreeable manner and in a very readable form. We doubt, however, whether his general readers will travel with him through the Parliamentary debates on the Repeal of the English Navigation Laws without some sense of fatigue. These debates are doubtless very curious and very instructive, as showing how men of high capacity and great experience in commerce missed their way entirely in their forecast of the consequences of the repeal of those laws; and it may be justly matter of self-congratulation to Mr. Lindsay that he was one of the few who were not dismayed at the prospect of competing—unequally, as it was then supposed—with the United States of America in the China trade, and that he led the van, in company with the late Mr. Richard Green, in carrying that competition to a successful issue. Of the spirit of the latter eminent shipowner and shipbuilder Mr. Lindsay gives an interesting illustration. Mr. T. H. Farrer, of the Board of Trade, was present at a public dinner in the City of London in aid of one of the "Marine Charities," and recounts the anecdote in a note addressed to Mr. Lindsay. There was at that time a great deal of irritation and discouragement among the chief London shipowners, and the Secretary of Legation of the United States had addressed the company in a speech which was not calculated to raise their spirits. When the turn of Mr. Richard Green came to speak:—

"We have heard," he said, "a good deal about the British Lion and the American Eagle, and the way in which they are going to lie down together. Now, I do not know anything about all that, but this I do know, that we British shipowners have at last sat down to play a fair and open game with the Americans, and, by Jove, we will trump them."

The feelings of the other shipowners present may well be imagined. Mr. Lindsay goes on to say: "And I may add he *did* trump them, for shortly afterwards he built a ship called the *Challenger* to match their *Challenge*, which thoroughly eclipsed her" (iii. p. 293).

Mr. Lindsay's third volume will be found to be a very convenient "Handy-Book" for all persons who are desirous of becoming conversant with the various questions affecting the interests of merchant shipping which have occupied the attention of Parliament during

the last few years. We have already alluded to the English Navigation Laws based on the celebrated "Navigation Act" of the Protector Cromwell. The object of that Act had been to secure to England the whole carrying trade of Asia, Africa, and America at a time when the interests of British colonists had no place in the question. The policy of Cromwell's Act, long believed to be the *Charta Maritima* of this country, was successfully denounced by Lord John Russell in the House of Commons in 1849, while the affirmative vote of the House of Lords in favour of its repeal counted the first Duke of Wellington among its supporters. The despondency consequent on the repeal of this Act was at first alarming, but within three years a reaction took place: freights, in many instances, advanced 100 per cent., and English merchants could not find sufficient tonnage to supply the orders pouring in upon them from every part of the world. Mr. Lindsay pronounces a deserved eulogy upon Mr. T. H. Farrer, of the Board of Trade, for his services to the country in preparing a variety of legislative measures for the improvement of the condition of our mercantile marine, and for his successful efforts in procuring the adoption of Mr. Moorsom's system of measuring the tonnage of merchant ships, which is adopted in the Merchant Shipping Act of 1854. "This admirable mode of admeasurement," Mr. Lindsay remarks, "has also been adopted in a recent Congress as the basis of ascertaining the tonnage on which ships of any nation are to pay dues on passing the Suez Canal." Mr. Lindsay might have added, in paying a just compliment to Mr. Moorsom, that the adoption of his method of measurement has not removed all the difficulties which have arisen between the shipowners generally and the managers of the canal, as the more difficult problem still awaits solution—namely, what is the proper method of calculating the effective capacity (*la capacité utilisable*) as distinguished from the entire capacity (*la capacité totale*) of a steam vessel. It is the practical solution of this problem which is at present contested, and which has given rise to the so-called "Question of the Transit Dues of the Suez Canal." Mr. Lindsay has not overlooked the "Unseaworthy Ships Commission" and its two Reports, which he praises highly; but he is disposed to think that there has been too much legislation of late in matters of detail as regards the commercial marine, and, although he commends the Board of Trade for its abstinence from interfering unduly with shipbuilders and owners of vast experience in their mode of managing their business, he is of opinion that the manner of conducting the Board of Trade enquiries into losses and casualties at sea in the present day is not such as to command general confidence, and he concurs in the last Report of the "Unseaworthy Ships Commissioners," which recommends certain modifications in that system.

Mr. Lindsay's fourth and last volume contains a very complete history of the origin and growth of Steam Navigation. Mr. Lindsay has done justice to the memory of Robert Fulton, of the United States, as the first person who "commenced and continued to run the steam-ship, which now traverses

every river, every coast, and every ocean, and which of all the inventions of man is the mightiest harbinger of peace amongst nations the world has ever seen." It is true that James Watt may have anticipated Fulton in discovering in 1769 how a steam-engine might be made available to propel a ship; and that in 1780 he may have invented the "Sun and Planet Motion," a necessary step to enable the steam-engine to be of really practical service in propelling vessels; and that Symington may have produced "the first practical steamboat," on the Firth and Clyde canal in 1802; but the merit of first permanently developing the power and usefulness of the marine steam-engine belongs, in Mr. Lindsay's opinion, to Robert Fulton, and the nickname of "Fulton's Folly" is the best certificate to posterity that the *Clermont*, which Fulton launched on the Hudson River in 1807, was a step in advance of other appliances of steam-power. The late Lord Lytton relates somewhere an anecdote of the late Duke of Wellington, who, when Lord Lytton had the indiscretion to ask the aged warrior publicly how he came to defeat all the ablest generals of Napoleon, replied: "I don't know how it was; each of them had a talent of his own in which he was perhaps superior to myself, but I had more power of combination than any of them." Fulton's merit, or possibly his demerit in the opinion of some English engineers, consisted mainly in the fact that he combined the inventions of others; but Mr. Lindsay justly observes: "If his was a combination of the discoveries of others, if he was a 'quack,' it was only on a small scale compared to those persons who combine the inventions of men of all nations in the magnificent steam-engines of the present day." Mr. Lindsay has brought together a well-selected mass of information in detail on the subject of the various stages of invention by which "fire and water" have been constrained to lay aside their natural enmity and to work together as peaceable "yoke-fellows" in the service of man, and his work seems to be written in a spirit of great fairness; yet by an accident he has overlooked, in his account of the various efforts to bring the screw-propeller into practical use, the claims of Mr. Henry Wimshurst to have his name associated with those of Captain Everson and Mr. Pettit Smith (iv. p. 116) in their first successful application of the screw-propeller on a large scale to a vessel called the *Archimedes* in 1838. Mr. Wimshurst has himself drawn up a statement of the part which he took in promoting the success of this experiment, which he has published in the *Nautical Magazine* of last May. "*Cuique suum*" is the rightful motto of inventors, but inventors should remember that it was not the first finder of the diamond, but he who first polished it and adapted it to use, who made it practically of value. We venture to suggest to Mr. Lindsay that the fourth volume of his work treats of a subject so special and complete in itself that it may well deserve his consideration whether it should not be published by him hereafter in a separate form, as a "History of Steam Navigation."

TRAVERS TWISS.

Reminiscences of an Old Draper. (London: Sampson Low & Co., 1876.)

THIS quaint little book might have been written as an illustration of the well-known saying of the old Scotch trader to his young relative about to start in business, when, wishing to impress on him the truth of the proverb, "Honesty is the best policy," he added, "and ye may tak' my word in the matter, for I ha' tried baith." The narrator of the story believes himself to be "the oldest draper now living in London," and he cannot be far wrong, for he started, as a boy of thirteen, at the beginning of the century, in a draper's shop in Whitechapel. He remembers when Todd, a haberdasher in Fore Street, gave his daughter to one of his young men named Morrison, and when the late head and founder of the great wholesale house in Old Change was "young William Leaf." He was evidently born for a dry-goods salesman. Before he was fifteen he had asserted his capacity by selling an ugly old green shawl, price 4*l.*, which had been in the shop ever since it was opened, and was the most highly "tinged" article in the establishment, a premium of 8*s.* being the reward of the seller. This our hero pocketed by inducing a sailor to buy it as a "really useful and valuable article." "Little rascal as I was," he writes, "I saw my chance." By such practices he was earning 100*l.* a year, or more than double his salary, at the age of fifteen, and, as one of the largest earners of these "tinges," or premiums on the sale of bad goods, in the establishment, soon drew the attention of, and became a great favourite with, his master. On the occasion of a fire in the shop, which burnt a few yards of common lace hanging near the window, he suggested to his master to have a "selling-off" of damaged stock, which seems to have been the first of the kind in London. The whole rascally operation from the issuing of handbills headed "Fire! fire!! fire!!!" is very graphically told, and worth studying (pp. 31 to 41). It has hardly been improved on in any respect since. One is glad to hear that the Whitechapel draper, who introduced and became enamoured of this kind of business, destroyed his regular trade by it, and was in the end ruined. But our hero had left him before this happened, and became chief "shawls' man," first at Lord Mayor Waithman's shop in Fleet Street, then at Everington's on Ludgate Hill, marts much frequented by the aristocracy. While here he was in the habit of promenading on Sundays as "a buck" in Kensington Gardens, and saluting his master's fashionable customers, in the morning in top-boots and buck-skins, in the afternoon in knee-breeches and silk stockings, a neck-handkerchief with a stiffener specially made for him, as his neck was unusually long, and an olive-green tail-coat with gilt buttons. No wonder that he had the satisfaction of a "hearty laugh the other day" when he came across his own likeness in one of Mr. Cruikshank's earliest caricatures.

But dress was his only extravagance, and from the first he saved his money, lived virtuously outside the shop, and read Homer and Ovid in translations, and Fielding,

Sterne, Smollett, and Richardson in his leisure hours, which habit no doubt accounts for the ease of his style, and the general excellence of his English. We have no space to follow his career, which took him to Chatham, Bristol, Merthyr, Manchester, in each of which he gathered new experience in dry goods. This he brought to bear at last, when he returned to London and started for himself in Holborn, where he had hard work to escape ruin, as the trade was already drifting westward. The ingenuity and pluck with which he met his difficulties turned what threatened to be a disaster into a success, which one cannot help sympathising with, even though in part earned by such practices as filling long ranges of shelves with dummies, carefully packed and labelled, so as "to make a most gallant appearance of fresh stock in first-rate condition." He quotes the proverb that "a man is never beaten till he beats himself," *à propos* of this part of his own life, which is certainly an instructive comment on the text. In short, the man is an excellent specimen of a class which has done much to make England what she is, in her strength as well as in her weakness—born traders, resolute, energetic, never losing a chance of getting knowledge, or pushing business, but not scrupulous about the means by which business is to be pushed, and with a decided taint of what there is no name for but snobbism. The snobbism and sharp practice wear off with the best of the class, as they did with our hero, who confesses towards the end of his book that he ought to have been thrashed for them in his early days, and who abandoned all trickery when he migrated from Holborn to the West End shop in which he ultimately made his fortune. On the other hand, zeal for and interest in their work, and dislike of seeing it blundered, retain their strength in such men to the end. Thus, long after his retirement, whenever the "old draper" sees a badly-dressed window, he tells us, he feels tempted to jump into it and set it out to advantage. It is this zeal, leading him to speak of and treat his trade as a fine art, and the ingenuousness of his confessions, which give the sketch its interest. Its value consists in the emphatic protests against all trickery and puffing with which the book closes, and the testimony that (notwithstanding appearances) the drapery trade is in a far sounder state in these matters than it was forty or fifty years ago, "that the new are better than the old days, which have passed away never to be experienced again." T. HUGHES.

University and other Sermons. By J. B. Mozley, D.D., Regius Professor of Divinity, Oxford, and Canon of Christchurch. (London: Rivingtons, 1876.)

FROM whatever point of view an observer of religious thought in England may pass judgment on the present parties in the Church, it is seldom that he has a good word to spare for the most distinctively English of them all—that which has, as a matter of history, the best claim to the inheritance of all that is greatest in Anglican theology. The "high and dry Church" is far from

being yet extinct; it would number an absolute majority, probably, among the mass of the parochial clergy, still more probably among the devout male laity above forty years old; but its vitality as a school of thought seems gone—it is only kept together by habits, and only recruited, if at all, by the personal example of some of its individual representatives. It has scarcely any intellectual basis, defensible on speculative grounds; it has little spiritual power, except over those reared under its continuous and exclusive influence; its recent literature is scanty, and it seems to be more and more impotent to guide or moderate the course of the national mind, but can only utter Cassandra prophecies, as the Church is hurried along by the conflicting impulses of more courageous spirits.

But while exclusive Anglicanism is thus tending, not undeservedly, to disappear as a form of opinion, there is a danger of the disappearance at the same time of its moral temper—of that sober, high-minded seriousness, and deep sense of responsibility for truth, which is the true greatness of Anglican divines from Hooker to Butler, and which was the strength of Butler's disciples before the expansion of his principles by the Tractarians passed into explosion. It is therefore opportune that a man like Dr. Mozley should appear, in a conspicuous position, and what ought to be an influential one, as the representative of this fast-vanishing spirit. We have here a mind instinct with the best temper of Butler's school, living and active in mature vigour in presence of the questions of our own day: and the influence of such a mind is likely to perpetuate that temper, as the writings of the master seem now to fail to do, because those who are excited about questions of the day, and feel rightly that they have an importance not of the day only, are yet unable to recognise the same questions as they appeared to a different generation. It is seldom that an author with so vigorous a personality as Dr. Mozley's can be so adequately characterised by referring him to a particular school. He is too thoughtful a writer to allow us to suppose that he has learnt nothing except what he learnt from Butler: still more unjust would it be to describe him as merely an old-fashioned Churchman. But that intellectual self-restraint which is one of the best and most constant features of the school has been exercised by him in the repression of those opinions which are individual with him, and not direct outgrowths of the Anglican spirit or the Butlerian method. To the theological or ecclesiastical controversies of our own time—so far as they are within the pale of Christianity—there is scarcely a reference: the first and poorest sermon in the volume, on "The Roman Council," is almost the sole exception. An ethical teaching, manly and at the same time humbling, and a conviction of the main doctrines of religion, too deep to feel the necessity of reiterating them to believers, or to share even for a moment the attitude of those who question them—such is the pervading spirit of all the Sermons.

And the moral nobility of this spirit is one which every reader must recognise:

nevertheless, there is a certain deficiency in it, both on the spiritual and the intellectual side, that qualifies the unreserved approval which the preacher has almost earned. Except in the sermon on "The Ascension" (a Cathedral not a University sermon), there is nothing that can be called devotional fervour in the book: though the doctrine on "the Atonement" is only too much in harmony with orthodox tradition, there is a real sense in which the charge might be justified that his preaching is not evangelical. Of course it does not follow that it ought to be so: a preacher, especially a University preacher, has other things to do besides commending the Christian faith to his hearers by his eloquence, or even his piety; but, when the object sought is the specific one of commending the Christian faith to hearers not necessarily ready to accept it, it does appear a mistake to leave out of view its most winning characteristics. There is a far greater impression of intellectual power produced by these sermons than by an equal number of Dr. Liddon's; but it is not too much to say that one sermon of his might dispel the scepticism of a dozen undergraduates sooner than these eighteen would meet the difficulties of one. And, after all, sermons are rhetorical works, and the end of rhetoric is to persuade.

Even the moral tone of the book has, to a certain extent, the same weakness as the devotional: it is very noble, but it is rather hard. The sermon on "The Unspoken Judgment of Mankind" begins by a just statement of the antinomy that "he that is spiritual judgeth all things, yet himself is judged of no man:" while yet his Master bids him "judge not, that he be not judged." But there is a painful inadequacy in the explanation given—that the judgment which is forbidden is only the utterance of the judgment which must be formed: charity is allowed λογίζεσθαι τὸ κακόν, if only she will lock up the account of it in her breast. And on the subject of "War," though much that is said is acute and reasonable, there seems a disposition to compromise the high claims of Christianity: true as it may be that in the present moral condition of Christendom wars of progress as well as wars of self-defence are legitimate, it does not follow that the possibility of such wars is to be tolerated as consistent with the Christian moral ideal.

In the more argumentative sermons, on the other hand, there seems to be a deficiency, not in feeling, but in the power of distinguishing feelings from facts, or acquired feelings from ultimate instincts. On the question of "eternal life," the term being used rather in the philosophic than the Christian sense, we find reproduced Butler's doctrine of the scientific legitimacy of probable reasoning: and so far, no doubt, the argument is sound against men like Matthew Arnold, who say it is unscientific to assent to Christian eschatology, because its doctrines "cannot be verified"—until the end of the world shall have come, either as they teach or otherwise. But admitting that it is scientifically right to believe in the invisible world, if there be evidence for it, even though not that "scientific" evidence which includes verification, then we come to

the question, Does such evidence exist at all? The only evidence Dr. Mozley offers is the assertion of the very facts which the Positivist and the Materialist question or deny, "to begin with, that our bodies are not *we*—not our proper persons." It may be questioned whether this fundamental proposition would have commended itself to the author of 1 Cor. xv. as much as it did to the author of the *Analogy*; but it certainly will not commend itself to those against whom the doctrine of a future life has to be defended now. Butler's argument was legitimate, his appeal to facts was indeed truly scientific, as a protest against the loose optimistic or sceptical assumptions of the deists of his day; but the materialism of our time rests on a basis of facts, too; and if its advocates have not succeeded in explaining away the whole group of facts relied on by the Christian apologist, they have at least imposed on him the necessity for a view of the whole case which shall correlate their facts with his.

Still stronger objections may be taken to the sermon on "The Atonement," because here facts are misconceived of which it is really possible to give a scientifically adequate account. It is assumed that the principle of expiation of guilt by a substitute is involved in all primitive institutions of sacrifice, and this is a theory which the science of primitive history may be said to have definitely refuted. The primitive Aryan or Semite *did*, according to all our evidence, think that his god would "eat bulls' flesh, or drink the blood of goats," if presented in a sublimated form; so, when he killed a bull or goat for his own eating, he "poured the blood (which was the life) upon the earth as water;" he "failed not to burn the fat presently," before either he or the priest directing him durst "take as much as his soul desired." It was doubtless the development of this custom when a whole animal was burnt for a sacrifice of sweet savour to the god; still later was the suggestion that such a sacrifice might appease his well-grounded anger against the offerer. And, even when the "burnt-offering" and "sin-offering" were thus differentiated from the primitive "peace-offering" and from each other, the sin-offering was still in general conceived rather as a fine paid to God than a symbolical endurance of death inflicted by God.

Altogether, for good and evil, this volume gives the impression of belonging to a past generation. But none but a very superstitious believer in human progress will think it the less valuable on that account. Our generation if it has learnt much has forgotten much; neither is it yet certain that it has true or abiding knowledge of the things which it seems to have learnt. At any rate, there is great scope in our day for the work of the teacher who will turn the hearts of the children to their fathers.

WILLIAM HENRY SIMCOX.

EPOCHS OF HISTORY.

The First Two Stuarts, and the Puritan Revolution (1603-1660). By Samuel Rawson Gardiner. With Four Maps. *The Fall of the Stuarts and Western Europe from 1678 to 1697.* By the Rev. E. Hale, M.A. (London: Longmans & Co., 1876.)

THE question that most naturally suggests itself in connexion with volumes like these is—what will they do for the student that has not already been competently done? Are they an improvement in any important respect on what may be found in other histories of a popular character? An endeavour briefly to answer this question will probably be the best service we can render our readers.

In one sense, nothing is easier than to compile an abstract of the history of any period; in another, there are few things more difficult. Very moderate industry and research will suffice for the production of an abridgment of a larger work, wherein statements have been verified by occasional consultation of the original sources, and detailed narrative has been reduced to more concise statement; but to produce a faithful miniature which preserves the original features in just harmony and proportion, and is to a more extended design very much what a photograph of a village taken at a distance of half a mile is to one taken only 300 yards away, is a task requiring no little care and discrimination.

It is the distinguishing merit of Mr. Gardiner's volume that it has been written by one who combines with a thorough knowledge of the facts the faculty of understanding the different points of view from which the leading controversies were regarded by the chief actors of the period. His aim, accordingly, has been, not so much to narrate what may seem of most importance when estimated from a nineteenth-century standpoint, as to explain the true connexion between seventeenth-century theorisation and seventeenth-century events. Nothing will better enable us to estimate the value of his work than a comparison of its treatment with that adopted in the 146 pages relating to the same period in Mr. Green's *History of the English People*. Of the two, Mr. Green has somewhat the larger amount of space at his disposal, but his omissions are serious. He gives, for example, no account of the Hampton Court Conference, fraught though its failure was with the gravest political consequences; he makes no allusion to King James's desire, and the Commons' disinclination, for a legislative union of England and Scotland; he vouchsafes no explanation of the constitutional importance of the Commons' right of impeachment, as revived against Mompesson and Bacon; the alliance with France, the expedition under Mansfeld for the recovery of the Palatinate, are passed by unnoticed. In the volume before us all these facts are brought distinctly before the reader, while the comments throughout are such as only an exceptional acquaintance with the period could have enabled the writer to supply. The criticism strikes us, indeed, as being of a higher order than that which fills up so large a space in Mr. Green's *History*.

Mr. Green's portraiture of James I., which is really little more than a copy of that in Macaulay's brilliant but immature essay on Hampden, at once prepossesses the reader against the unfortunate monarch. Mr. Gardiner, who tells us nothing about James having "goggle eyes" and a big head, assesses his virtues and defects more equably. He does not disguise his shortcomings, but, in spite of Puritan scandal, he inclines to the conclusion that his life was "virtuous and upright," and that, though infelicitous in his choice of means, "he really wished to do right to all men." As regards the relations of England to Europe, while holding that the Commons were "right in the main," he allows that James "doubtless knew more than they did of Continental politics," and he is evidently in no way disposed to deny that with the patriotism of the Protestant party there was combined a large amount of ignorant and bigoted prejudice. The action of the Commons throughout James's reign, taken as a whole, was a noble struggle for freedom, but it often breathed a spirit of the harshest intolerance. The same Parliament of 1621 that asserted so valiantly its own right "to propound, treat, reason, and bring to conclusion," also petitioned for the enforced recall of all children of Catholics then receiving their education abroad, and their consignment to Protestant teachers.*

In Mr. Green's opinion, James's theory of the Divine right of Kings was "founded simply on a blunder," and, after quoting the celebrated parallel instituted by the monarch himself between Divine and kingly claims to immunity from criticism, he leaves the quotation, in all its isolated absurdity, to the scorn of the reader. It is certain that a like "blunder" was made and insisted upon by Louis XIV. with at least equal emphasis; but Mr. Gardiner's comments enable us to see the question somewhat differently:—

"It is easy to look upon these words as a mere absurdity. Yet not only are they worthy of consideration, but they will be found to furnish the key to much of the subsequent history. The fact is that no nation can be governed by general rules. These rules, being the work of fallible human creatures, cannot possibly embrace all points of difficulty that may arise. When new difficulties come up for settlement there must be some living intelligence to meet them, to frame new rules, to enlarge the old ones, and to see that persons entrusted with carrying them out do not misuse their authority. With us this living intelligence is looked for in Parliament, or in Ministers acting in responsibility to Parliament. Under the Tudor constitution new rules could only be laid down by the combined operation of King and Parliament. But it was considered to be the king's business to keep the machine of government in working order, and to make special provision for temporary emergencies, without responsibility to anyone. James's vague language doubtless implied assumptions of a dangerous kind, but in the main he meant no more than that the limits to the exercise of this special power were in themselves indefinable. The power must be used when occasion called it out, and no one could say beforehand how it would be right for him to act in any given circumstances."

This passage appears to us an excellent example of true historical appreciation of the significance and merits of an exploded theory. Bacon himself, we imagine, would have been

* *Calendar of State Papers, 1621-3, Dec. 3, 1621.*

THE University Court of St. Andrew's has elected the Rev. William Knight, of Dundee, to the chair of Moral Philosophy in the United College, rendered vacant by the appointment of Prof. Flint to the Divinity chair in the University of Edinburgh.

inclined to congratulate the writer on his ability to view the question through a medium of "dry light."

While, again, Mr. Gardiner's attention to the general facts is more carefully sustained and his criticism often the sounder, he has also been at considerable pains in his account of any special episode to give all the material details clearly and tersely—succinctly, of necessity, but with no important feature omitted. It is one of the main defects of Mr. Green's volume, on the other hand, that he is sometimes in so much haste to put the reader in possession of his inferences from the facts that he omits to give the facts themselves. A comparison of the accounts of the Gunpowder Plot, of Raleigh's expedition up the Orinoco, and of Wentworth's rule in Ireland, as given in the two respective works, will illustrate this difference.

We should hardly expect to find in Mr. Hale's volume criticism of a kind that is to be looked for only from one who has long and closely studied the original authorities for the period, but his experience as an educator enables him to discern what is most wanted at his hands, and, though mainly following Macaulay, he occasionally exercises an independent judgment. The opening chapters explain with great clearness the position and policy of Louis XIV. in relation to Europe, and this collateral illustration is well sustained throughout the volume. The important distinction between the moderate Catholicism of Innocent XI. and the policy and schemes of the Jesuits as supported by Louis and James (a distinction entirely lost sight of by Mr. Green) is carefully pointed out.

In fine, these two volumes appear to be very much what an introductory series should be. A school history should be free, as far as possible, from violent partialities, special pleadings, or highly-coloured portraiture. Once set before a schoolboy a distinctly unfavourable picture of an individual, and his sympathies are forthwith bespoken, and he probably altogether foregoes what ought to be the most beneficial part of his work—the attempt to estimate men and their doings for himself in the light of the simple facts. Wise parents do not point out to their children all the defects of grown-up people or all the ways of the "wicked world" about them; and wise instructors will keep back much that serves to add to the appreciation of personal character until the opportunity comes for a more detailed study of the men and manners of the period.

J. BASS MULLINGER.

Clouds in the East; Travels and Adventures on the Perso-Turkoman Frontier. By Valentine Baker. (London: Chatto & Windus, 1876.)

It is strange that among the many articles on the Oriental policy of England which have appeared in quarterlies and monthlies, and the gist of which has found utterance in the correspondence of the daily press, so little attention has been drawn to the significance of Eastern Persia, where, between the Caspian and Herat, lies a frontier of ex-

ceeding interest to the politician (and perhaps the general reader) as well as to the geographer. The author of the present volume, rightly arguing that former travellers had, as a rule, only crossed the said frontier, but had not examined it laterally, determined in some way to remedy the defective exploration by following the skirt of the mountain range immediately overlooking the Turkman desert. This line may be illustrated by the two points of Sarakhs in the east and Kizil Arvát in the west; and the intervening localities actually visited were within the section extending from Kalát-i-Nádir to the western side of the Darah-gaz districts. A still more recent exploration of Kalát-i-Nádir and the Darah-gaz, by the Hon. Captain Napier, has added to the information already gained on these regions; and supplied the material of a paper read at a meeting of the Royal Geographical Society in January last.

Colonel Baker, accompanied by Captain Clayton of the 9th Lancers and Lieutenant Gill of the Royal Engineers, left England in April, 1873, and passing through Vienna and Constantinople, reached Poti, on the eastern shores of the Black Sea, early in the following month. Hence, taking the newly-laid rail so far as completed to Tiflis, they availed themselves of a necessary detention at that capital to penetrate to the Dariel pass and visit Vladikavkas. There is little more detailed description given of the road from Kutais to Tiflis than that "Suram is very prettily situated in a rich hilly country about 3,000 feet above the sea;" but this brevity is attributable to the matter-of-fact locomotives, which keep from the ken of passengers the picturesque and beautiful in detail, ignoring, or admitting mere nominal reference to, Rhions or Kúrs, a Gargantz and a Gori. The account of Tiflis itself is not flattering, though correct. Something is said of its museum, its club-gardens, and little Russian theatre; nothing of its club and charming opera-house: but then, the last, a perfect *bijou* in its way, was probably closed. From the Georgian capital the travellers proceeded to Baku, there embarking on the Russian Caspian steamer. They touched, as usual, at Lenkorán, Enzali, and Mashhad-i-Sar, and effected a landing at Parivale or Gaz, whence they made a short land journey to Astrabad, returning to the Russian settlement of Ashuráda. After visiting the mouths of the Atrak and neighbouring coast, they turned towards Tehran, which city they reached, *viâ* Ashraf, Sári, and Firuzkúh, on June 18.

For nearly two whole months two of the travellers remained in summer quarters at Gulahak, or amid the mountains of the Albúrz, enjoying beautiful scenery, a charming climate, and out-of-door sport, of which trout-fishing was a main feature. One of the party was unfortunately compelled by ill-health to return to England. It was not until August 16 that the author and his remaining companion fairly left the refreshing waters of the Lár, and moved again towards the south-east corner of the Caspian. A few exciting days of travel and adventure, during which were visited Amol, Barfarúsh, Chashma-i-Ali, and Damghán, brought them to Shahrúd, a town on the high road to

Astrabad, Tehran, and Mashhad. They reached, moreover, the last-named of these towns by the end of September, and marched a stage towards Herat on October 5. Sickness, however, combined with other causes to change the route proposed. Returning to Mashhad, they set out again two or three days later, taking this time a course to the north-east in lieu of south-east.

The hundred pages or so succeeding the chronicle of departure from Mashhad form the most important portion of the volume. They narrate a journey to and from the Atrak through a region of great interest, and, as the account of eye-witnesses and not second-hand, it is of especial value. From Mashhad the explorers made a short ten-mile march, crossing the Kashf-rúd; then, entering the mountains, they passed on to Kardeh, "like all the villages in this country, a little fort." For the following march to Wardeh a short extract will be appropriate. The gorge they are threading to the N.N.E.—

"gradually became narrower and narrower until in some places it was not twenty feet wide, with rocks coming sheer down on either side; a mere cleft in the mountains. The ascent was continuous, and at last we broke rather suddenly upon beautiful mountain slopes with a very considerable amount of vegetation, and the juniper-tree standing, not in woods but singly, or in small patches. It looked a lovely country for game; but, except partridges, we saw nothing. There were high mountains both to our right and left front; great majestic ridges of rock, sometimes taking fantastic shapes, and with their strata running vertically, as if disturbed by some gigantic upheaval. In places the sides of these mountains were sheer precipices, while the ridges looked perfectly sharp."

The next stage to Wardeh was Kalát, better known as Kalát-Nádiri. Beheld from without, this place is a stupendous stronghold. From within, it is a valley surrounded by mountains. On the way Lieutenant Gill narrowly escaped a serious injury from the accidental discharge of his fowling-piece. As it was, some fourteen shots penetrated his riding-boots and inflicted flesh wounds. The wonderful fortress is thus described (pp. 201-2):—

"The walls are mountains of from 800 to 1,200 feet high, and with a sheer perpendicular scarp between 300 and 600 feet; sometimes more. It is an irregular oblong in form, about twenty-one miles long by from five to seven broad. There are only five entrances, through narrow natural scarps, and these are fortified. Three of them are on the northern face, one is on the eastern, and another on the southern. The ground enclosed within is very rich, and it might be a perfect garden and self-supplying. The stream which we had followed runs right through the place, in at the southern entrance and out at one of the northern. There is also some cultivation outside the work; and, after being used for irrigating a considerable tract of land, this stream is allowed to revert to its natural channel, whereby it forms the main supply of water used by the inhabitants. Hence, I imagine, the great unhealthiness of the place. But there are several springs within the fortress, and one just outside the southern gate. Moreover, there are numbers of old *kandás*, and I have no doubt that an ample supply of good water could thus be obtained for the cultivation of the whole interior. That it once had a much larger population, and was in a more prosperous state, the numberless remains of villages testify. . . . The Persians maintain a

battalion of regular troops here, besides some irregular cavalry and a few guns. The battalion now occupying it had arrived from Tehran 900 strong, only three months before. Since that time 300 had died of typhus, and the remainder were in the most miserable condition. The officers had all deserted their men and gone off, and those men who had any money had done likewise; but the mass were left without pay. About 200 still occupied the houses near the southern gate, and a sort of guard was kept up; but the men were in a ghastly state, and lay here and there dying of the fatal scourge. We hastened on for about six miles inside the fortress, until we reached the town, in which was situated the residence of the Governor."

The palace of Nadir Shah (Imárat-i-Nádir), now a ruin of burnt brick, situated on high undulating downs north-west of the town, was not forgotten. To reach it the author ascended the hills (always, be it remembered, *within the fortress*), "by a zigzag but fair path, to the height of 1,500 feet." North of the ruined building is yet higher ground, along which he was riding at a canter, when a summons to pull up from the Kúrd guide disclosed a precipice of 1,000 feet immediately below. This was the wall of the covert. All travellers agree in the charm and interest of the view here presented; and we strongly recommend the reader of these explorations to realise the geographical situation contemplated by the writer in his earnest, if sparse, descriptions recorded at page 201 of his book, and continued up to page 209 *passim*.

We cannot recall any previous account of the direct route traversed from Kalát-Nádiri to Darah-gaz, or to its capital, Muhammada-bád, into which place the strangers were escorted by a hundred horsemen. It lay through mountains and among streams, ending in a plain at foot of the range marked "Gulistán" in the map, or eastern section of the Kuren and Kopat Dúgh; and before its termination there must have been considerable risk run of encounter with Turkmáns. Space will not admit of more than passing allusion to the Darah-gaz district, rendered prosperous by wise local government, or to the road from Muhammada-bád to Daringa, and thence to the Kuchán valley and Shirwán. The source of the Atrak*—a river mentioned more than forty years ago by Burnes as rising near Kuchán—is pleasantly illustrated by one of the many coloured drawings interspersed through the volume under notice. From Shirwán, the main road between Mashhad and Tehran was reached *via* Já-jarm. The return to the Shah's capital was accomplished before the end of November; and on December 1 the Russian steamer was awaited at Enzali on the Caspian for the conveyance of the homeward-bound.

Testimony is given to the carefulness of Lieutenant Gill's observations, as well as to the patience and perseverance with which every angle in the road was noted, or other detail worth recording jotted down in his journal; and if proof of the value of this

officer's work were needed, other than afforded by these pages and the maps accompanying, the interesting paper read before the British Association at Belfast in 1864 would be more than sufficient.* We could say much of certain living characters described—their talk and opinions, valuable in one sense and worthless in another; we could add something of the servant Shaab, his good points as well as faults and failings—but indulgence in any such retrospect would inevitably entail transgression of reasonable limits.

One word, however, in conclusion. The political character of this book, signified in its title and professed in its Introductory Chapter, renders of secondary consideration its value as a narrative of travel and adventure. In dealing, therefore, mainly with its instructive or entertaining features, we take it at a certain disadvantage, and more or less ignore its weightier purport. If on the present occasion, we have approached it in such light, it has been with no wish to shirk the *gravamen* of the subject offered, but rather because the "clouds" of which we are warned have been observed and reported on by regulation-pilots, whose reports, whatever their nature, have been declared satisfactory and conclusive. Not that we really trust the opinions of certified professionals a whit more than of practised outsiders; but that there are signs of a coming good time when all competent judges will be invited to express their views, and we believe the situation to be somewhat favourable for a pause. Under any circumstances a passenger volunteering advice to the ship's captain and officers runs a risk of that formidable kind of snub which, administered on the quarter-deck, is proof against a reply or remonstrance. As for the man at the wheel, if not to be addressed under ordinary circumstances, what should be our reticence now that the general horizon presents appearances yet more urgent than the cloud overhanging the mountains north of the Atrak?

F. J. GOLDSMID.

Mythology; Illustrated chiefly from the Myths and Legends of Greece. By A. S. Murray. (Chambers's Elementary Science Manuals. Edinburgh: W. & R. Chambers, 1876.)

THIS little book differs from Mr. Murray's former work (reviewed in the ACADEMY of April 4, 1874) partly by presenting the same matter in a much smaller compass, and partly by the attempt to treat the subject in a more scientific manner. As he says in a preliminary note, he has attempted "to explain the principles on which the myths and legends of all nations have been formed, by illustrations drawn chiefly from the mythology of Greece." The readers of his former book will be prepared to find the subject treated in an interesting way, and with much knowledge of the details of Greek myths. But we cannot think that those who have followed the modern discussions of the origin and growth of mythology will feel satisfied with the book as a whole. It is very doubtful, in the first place,

whether the science of Comparative Mythology has reached the stage at which the composition of a good elementary manual is possible. In fact, we have only to look at the introductory pages of Mr. Murray's book to see that he finds himself confronted *in limine* with questions to which he can give no generally approved answer. Further, those who have read and enjoyed Mr. Murray's treatment of Greek mythology as a body of narrative, or in its connexion with Greek art, may still doubt whether he has the qualifications needed for a critical examination of its origin and formation. This want is not shown so much in positive mistakes as in the whole method of treatment. For example, in the account of Zeus on pp. 27 ff., Mr. Murray seems uncertain how far his character is to be explained as a personification of the heavens, and concludes that it is "only as a local habitation that the heavens are associated with him in the first instance, and, though it is natural, it is certainly not necessary that he should have power in that region more than in the others." But if, as Mr. Murray admits in his chapter on Comparative Mythology, the name of Zeus had once been the name of the "bright sky" (p. 85), the scientific treatment of Zeus must begin with this fact. Comparative Mythology is not an appendix to the science of mythology; either it is the basis of the whole science, or it is nothing.

It will hardly be admitted that "in the marriage of Zeus and Hera we have a personification of the marriage of the heavens by day with the heavens by night," or that the stars were the numerous eyes by which Hera could look after the doings of Zeus (p. 30). Mr. Murray adds that naturally Hera was made to dislike the moon, which seemed to blind the stars. Further on, he says that the epithet Boöpis (ox-faced) applied to Hera may have arisen from her relation to the moon, which was usually represented under the form of a horned cow (p. 32). It is at least abrupt to turn the "relation" of dislike into that of mythological identity. Suggestions of this kind may be worth making, but they need a great deal of critical sifting before they can take their place in elementary books.

Mr. Murray's account of Hermes is not better entitled to the confidence of beginners. "In one set of the myths about him, Hermes appears to be god of mountain-mists, and to express by the thefts which he committed the concealment and temporary loss of herds" (p. 53). Mr. Cox has explained Hermes as the wind, and Mr. Max Müller as the dawn. Is any one of these views certain enough to be taught dogmatically? If not, the time has hardly come for an "elementary science manual" on the subject.

To notice a few minor errors: "the *Erinnys* or *Furies*" (p. 18) should be the *Erinyes*, and the same correction has to be made on page 36 and page 66. "Trinakia" (p. 47) should be "Thrinakia." Ares did not fall with the "crash of nine or ten thousand warriors" (p. 53), but his shouting was like that of nine or ten thousand warriors. And what authority is there for "the numerous class of child's stories about ogres and such like, which the Greeks called *mytharia*" (p. 8)? D. B. MONRO.

* Kara-kazán, five miles from Shirwán (*Clouds in the East*, p. 280). Captain Napier says two miles and a half; and mentions a higher permanent source, about fifteen miles north-east. The discrepancy in distance is not very material, as measurements may not in both cases have been made to the actual head of the stream.

THE LANCASHIRE LIBRARY.

The Lancashire Library, a Bibliographical Account of Books on Topography, Biography, History, Science, and miscellaneous Literature relating to the County Palatine, including an Account of Lancashire Tracts, Pamphlets, and Sermons printed before the Year 1720. With Collations and Bibliographical, Critical, and Biographical Notes on the Books and Authors. By Lieut.-Colonel Henry Fishwick, F.S.A. (London: G. Routledge & Sons; Warrington: Percival Pearse, 1875.)

THIS title very adequately indicates the scope of Colonel Fishwick's book. County bibliographies when fairly done are always useful and often entertaining, and this is a favourable specimen of the class. The author has had a rich field to work in, and both industry and selection have been exercised. The harvest-field is, indeed, so large that some portions of it have had to be deliberately passed over untouched, and in others there is still something left for the gleaners. Works to be included "must be written about or refer to Lancashire places, persons, or things." This rule, considering the wide extent of the local literature of the County Palatine, is justifiable. The wisdom of excluding, "as a rule, tracts and pamphlets printed since 1720" is more open to exception. In several cases it has been neglected with advantage. The task of deciding what is a pamphlet has bothered many a bibliographer. We are not, therefore, surprised to find our author observing of one work that it "is perhaps, strictly speaking, a pamphlet; but will be found useful to the topographer." The principle indicated here is a far better one to follow than the arbitrary division of literature into the sheep of books, and the goats of pamphlets. Variations in type and paper may easily make the same literary matter either book or pamphlet at the option of the printer. If a tract gives an intelligible explanation of a person or thing connected with the county, it would seem to have a fair claim for admittance into this list. A village history is much better when compressed into a pamphlet that everyone can buy and read than when diluted into a volume intended only for the high-polite. Some of the smaller places have an interest of their own. Thus Mr. J. B. Horsfall has given an account of Royton and Chadderton, and their associations for the mental improvement and self-education of the inhabitants. Royton stands in a vale between Oldham Edge and the Tandle Hills, and at the beginning of the century was noted for its Jacobins. These advanced Liberals were at one time well coddled by their loyal neighbours; but as hand-loom weaving declined they found many sympathisers. The Jacobins started a circulating library in 1794. Though it did not contain a thousand volumes, the works were for the most part well calculated to promote thought. They also organised a society for the study of botany and natural history, of which John Mellor, an artisan naturalist, was the president. This society organised a small scientific library. Mr. Horsfall, writing in 1854, names several other circulating libraries, and several

"mutual schools," in which young men assembled to teach each other the elements of knowledge, and by their associated twopences to obtain external help. Altogether, Royton had eighteen newsrooms, libraries, and self-improvement societies, excluding of course the ordinary day, night, and Sunday schools. The "teetotallers," in the year of the plug-drawing, established an educational institute. A Sunday-school was afterwards attached to it, in which the three R.'s were taught. In the churchyard of Royton rest several men who, in spite of the bitterest poverty, reached the height where science smiles upon her children. Butterworth, Compton, Grime, and Kay were all of the artisan class, and honourably known for their contributions to the mathematical periodicals of sixty years ago. These particulars we take from a small pamphlet excluded from Colonel Fishwick's list.

There is much that is interesting in the *Lancashire Library*. We catch many glimpses of the good old times. Thus we have a reference to Father Arrowsmith, hanged at Lancaster in 1628 for being a priest, whose hand, preserved as a relic, has the reputation of having performed many wonderful cures. Matching this is a notice of George Marsh, the Protestant martyr, whose supposed footprint was long a thing of marvel to the visitors at Smithills Hall. Of another complexion is the account of the "Festival of Win," a public dinner given on his return home to the gallant Captain Phipps Hornby, under the shade of an immense oak at Winwick, in 1811. The dark shadows of superstition are visible in the notices of the Lancashire witches, nineteen of whom were executed for their supposed crime in 1613. Other forms may be noted in the Surey demoniac, in the prodigious monsters asserted to have been born at Kirkham and Adlington, and in the strange apparitions visible at Bolton in 1650. The history of religious enthusiasm has few finer episodes than the early career of the Quakers. The county palatine is closely associated with this. Fox married a Lancashire widow, Margaret Fell, of Swarthmoor Hall, and found a ready response to his rugged appeals among the yeomanry. The persecution against them was exceedingly fierce. Oliver Atherton, of Bickersteth, was imprisoned for non-payment of tithes, at the instance of Charlotte de la Tremouille, the gallant defender of Lathom House, nor would she grant him liberty, although the danger to his life was represented to her in a petition drawn up by the prisoners of Lancaster Castle. His death is a dark stain upon her character. Thomas Rudd was imprisoned and whipped through the streets of Liverpool. Francis Patchet died in the Fleet Prison for non-payment of tithes. Barrow, another Lancashire Friend, had some strange adventures in Florida. One of the most interesting of the early Quakers was Richard Hubberthorne, of Yeland, who had served in the army of the Parliament. He made his way upon one occasion into the presence of Charles II., with whom he had a long talk about the doctrines and persecutions of the Friends. The king was good-natured enough to promise him that they should not suffer for their religion. The value of a Stuart promise is abundantly

shown by the fact that Hubberthorne died of the jail distemper in the prison of Newgate.

Colonel Fishwick may fairly be congratulated on the success he has achieved. We say this notwithstanding errors and omissions to which it would be easy to point. In a work of this description a pretty wide margin of allowance must be made for such mishaps. When a second edition is called for a number of typographical errata will no doubt silently vanish. By dint of patient rummaging of the stores of public libraries and private collections, a book has been produced which will certainly be a welcome aid to all interested in the county of the Red Rose. WILLIAM E. A. AXON.

BAYONNE UNDER ENGLISH RULE.

Etudes Historiques sur la Ville de Bayonne. Par J. Balasque, avec la collaboration de E. Dulaurens, archiviste de la ville. (Bayonne: 1862-1875.)

Récits et Légendes relatifs à l'Histoire de Bayonne. Par Henry Poydenot. Fasc. 1, 2, 3. (1875-6.)

THESE two books give us a specimen of the difference between the workmanship of an artist, a workman, and an amateur. That of the two former is highly valuable, while that of the last is only occasionally interesting. The amateur work is the three fascicules of M. Henry Poydenot, entitled respectively, "Fondation de la Ville de Bayonne et Origine de son Nom;" "Notes sur la Cathédrale, les Convents, et quelques autres Monuments Anciens;" "Principaux Evénements survenus à Bayonne pendant l'Occupation Anglaise, 1152-1451." These show considerable reading and some acquaintance with original and MS. sources, but there is an utter want of critical discrimination; all authorities seem to be treated as of equal value. Of the two *collaborateurs* in the larger work M. Balasque is the literary artist, while M. Dulaurens is the diligent and critical collector of materials. The want of the artist's hand to mould these materials into perfect form is evident in the latter half of vol. iii., compiled since the death of M. Balasque; it hardly rises above materials "pour servir." The period included is the same in both of the above works—from the origin of the city to its reunion with France.

It is always instructive to look at our own history through the eyes of a foreigner; and this will give a charm to these works in the eyes of all Englishmen. MM. Balasque and Dulaurens, too, are singularly unprejudiced. The days of Bayonne's greatness and independence are bound up with the English domination; by its reunion with France it sank to the position of a mere French frontier fortress like a hundred others, with no peculiar history of its own. Before this time the mayors of Bayonne used to receive letters from their English sovereigns couched in terms of something like equality, "en beau style redondant avec force louanges." Bayonne then compelled her neighbours to bring their produce to her market and to sell it there almost on her own terms; but while enforcing "protective" duties on all strangers, she claimed for herself free entry

to all English markets for her own produce. Then she made separate treaties with Navarre and Castile, with Biscay and Guipuzcoa, with the Asturias and Galicia, almost like an independent State; and no fortress could be erected in the Labourd without her consent. It was when Bayonne was most free that she served England with greatest loyalty. Only in the last twenty years of the domination do we find English names supplanting Gascon ones as mayors of Bayonne. It was the loss of the spirit of municipal freedom, quite as much as the advance of French arms and the influence of French gold, that sapped the loyalty of its inhabitants to England.

Many well-known characters in English history appear in these pages. The phrase "Angevin Sovereigns" has become established of late as the fittest term to describe the early Plantagenets; but here Richard I. is regarded almost solely as a Gascon prince, to which appellation he is entitled on his mother's side. And certainly no better type of the Gascon can be found than Richard Cœur de Lion, with all the defects and merits of the race. Even the Béarnais Henry IV., with more political sagacity but with less literary culture, is not so genuine a specimen. As in England, so in Guienne Simon de Montfort towers above all his contemporaries; but it is more strange to read a defence of Gaveston, the unhappy favourite of Edward II. Whatever his conduct as a courtier may have been, he certainly understood the true interests of England in Guienne, and most skillfully advanced them. We have little space in which to speak of the Black Prince, but M. Dulaurens well remarks that it was the previous campaigns of the Earl of Derby which alone made Poitiers possible. He also notices, with Professor Stubbs, that the chivalry of the Black Prince was a mere recrudescence and parody of a spirit that was fast expiring. It was depending on this false chivalry, instead of fostering municipal and commercial freedom, that led to the rapid and easy fall of the English power in the south. Yet even at the last the sole entry of the capture of the town in the archives of Bayonne speaks volumes:—"Lan mil iiij^e Lj. a vj. dies d'agost, metton seti a Baione lo conte de Foix, moss. de Dunoys et moss. de Labrit, et prengon lad. cuitat lo XV^e jorn deud. mes." Popular tradition tells of the miracle of a white cross appearing in the sky to replace the red cross of England on the morning of the surrender; but the city scribe writes only as above.

Besides what relates to England the first of the above works contains an excellent picture—all the more valuable because not a highly-wrought or sensational one—of life in a highly privileged town in the Middle Ages. We find here long beforehand the curious mixture of the patriot, merchant, and adventurer, which has been remarked among the great seamen of Elizabeth's reign. The Bayonnais were ready to carry wine and cider, or to furnish war-ships to England, or to capture whales in the Bay of Biscay; but they gave the name of their own seaport, Cap-Breton, to an island off Nova-Scotia, and they never lost an opportunity of capturing and pillaging a foreign, and especi-

ally a Spanish, vessel whenever it promised to be an easy prey. The normal state of Bayonne for some centuries was to be fighting with the Basques and the Comtes de Gramont on land, and on sea "un peu contre tout le monde" (vol. iii., 168). After all that has been written on the subject, the sumptuary laws and the restrictions on trade seem well-nigh incredible: e.g., in the fourteenth century it is forbidden to the bride on her marriage to give her husband more than two shirts, and the bridegroom was not allowed to give stockings to his friends "sous peine de 20 livres de Morlâas." All fish caught from Cap-Breton to Biarritz could be sold only at Bayonne, and there every hindrance was put in the way of the vendors. The produce of the farm and vineyard could likewise be sold only at stated seasons of the year, at certain hours of the day, and at a fixed tariff. The clergy alone enjoyed anything like freedom of sale or purchase; and that only for the produce of the cathedral lands and for the consumption of the chapter. Another almost equal obstacle to commerce was the complexity of the monetary system and of weights and measures. We might almost defy an H.M.'s school inspector to examine his family bills when the confusion was such that it was considered a simplification to decree (1377) that there should be only eight different measures of the piece of cloth, varying fractionally from $24\frac{1}{2}$ verges to $10\frac{1}{4}$; only eight different kinds of measures of wine and cider; when the pound weight was to consist of $14\frac{1}{2}$ ounces, and the currency of pieces of eight different coinages bearing all the same denominations of "denier," "sol," and "livre." The cost of living was subject to great variations, but in the fourteenth century wine and wheat seem to have been double their present price. Rent of land seems to have been cheaper. A lease is mentioned (vol. iii., 481) for one-fifth of the produce, instead of for one-half as under the present *metayer*-system. This was probably owing to the insecurity of the labourer, who was obliged to go to work with arms in his hands. What law-suits were then we can imagine from the preamble of an ordinance (1403) against appeals—"Seeing that suits before the judge of appeal in Gascony are immortal (immortals)." Through the effects of mortgages, debt, pestilence, and violence, property had got into such confusion in 1334 that an ordinance very like the Irish Encumbered Estates Act was passed by Vidau de Castet with good effect. It guaranteed a title to all property bought or sold under its conditions.

One word as to the ecclesiastical status of the diocese. Though Bayonne was almost a Gascon outpost in a Basque country, and its inhabitants were at perpetual feud with their Basque neighbours, yet the diocese extended far into Navarre and Guipuzcoa, and the authority of the bishop was acknowledged there. One of the most curious documents of vol. iii. is the will of Godin, Cardinal of Bayonne, who was to Philip le Bel what Wolsey was to Henry VIII. A Ritualist might well study the ornaments rubric therein. A very dark picture of the morals of the clergy is sketched out in an ordinance of 1427—"De macipes de caperans

et autres reneguados et juguados." A still more outspoken law exists in Basque; and for the state of the Spanish clergy the student must follow up the references of vol. iii., 204.

These are only some of the points of interest touched upon in the honest and impartial volumes of MM. Balasque and Dulaurens. The second fascicule of M. Poydénat may be useful as a guide to the cathedral, but for all else we refer the student to the former work, which is fully as superior in value as it is larger in bulk.

WENTWORTH WEBSTER.

CURRENT LITERATURE.

The Balearic Islands. By Charles Toll Bidwell, F.R.G.S. (Sampson Low and Co.) This is a good book, but it is rather difficult to see for what class of readers it is intended. It is decidedly heavier, but apparently more trustworthy, than most of the books written for the sake of intending tourists, and yet it is too slight to be of real service to the student either of history, of political economy, or of natural science. Compiled by an official man, and mainly from official sources, with its many tabular appendices, it has in parts the air of a Government Report, or of a Blue-Book in embryo. Still it is not a bad book. If not brilliant, there is an air of common sense and candour about it which begets confidence—a confidence which is founded chiefly on the fact that there seems to be no desire to write up the subject of it, the Balearic Isles, unfairly, either on the score of cheapness, comfort, climate, or scenery. Sentences like these (on p. 15):—"For these reasons, it is, we think, somewhat doubtful whether the climate would not be too variable for those who seek an eligible winter residence on grounds of health;" "Certainly native consumptive patients go off very suddenly and quickly"—are clearly not written for the purpose of seducing invalids; and for this honest warning thanks are certainly due to the author. The singular difficulty of procuring suitable houses or apartments, and the still greater difficulty of procuring decent servants, joined to a scale of prices for necessities much higher than that of many more accessible places on the Continent, will avert that class of visitors who live abroad from motives of economy. The islands may be a paradise for servants, but they decidedly cannot be so for mistresses. It will sound strange to students of political economy to hear the widespread *metayer*-system described as "a system of partnership," and spoken of as if it were something peculiar to the Balearic Isles. But it speaks well for both landlord and tenant where such a system works satisfactorily. Unless conducted with fairness and consideration on both sides it is open to gross abuses. If the landlord strictly exacts it, half the produce, except under exceptional cases, is too high a rent for the tenant to pay; while, if the tenant is a rogue, the landlord is easily mulcted of his fair share of the produce. Excepting in a population like that of the Balearic Isles, where doors are left unlocked night and day, and where tempting objects are left in the fields unwatched without risk of being stolen, the landlord's portion becomes really far less than under a nominally lower rent. This we have found to be the case in all countries where we have watched the operation of the system. The chapters of most general interest will be found to be those on courtship and marriage, on servants, and on society. The curious Spanish law, which prevails also in Portugal, whereby a suitor of equal rank can legally compel the assent of the parents of his intended bride (if of full age) to a marriage which they object to seems to be more frequently put into operation in Majorca than elsewhere. Under its provisions the *fiancée* can be removed from the custody of her

parents, and handed over to that of some fit duenna approved by the suitor, who is responsible to him for the safeguard of her charge during the three months of probation previous to the marriage. Our author justly speaks with reprobation of its proceedings, and yet we have known one or two happy marriages in Portugal brought about under its provisions. The one class for which there seems to be a real attraction to the Balearic Isles is that of painters and sketchers, amateur or professional. Aesthetic study stands out in marked contrast to more useful every-day education. While eighty-five per cent. of the population can neither read nor write, the Art School of Palma is inferior to only one school of Italy (Milan) in the number of its students. A love and regard for art, especially painting, seems almost universal. It must be very delightful for one with the necessary qualifications to wander with tent and brushes through the picturesque scenery of these islands, amid a population from whom neither insult nor robbery is to be feared, and in a climate which makes tent-life sufficiently enjoyable through the greater part of the year. It is to artists and to those who think that the observation of quaint mediaeval customs, and of habits of thought which have become obsolete elsewhere, more than compensates for inconvenience and discomfort that these islands will prove attractive. According to our author, they have little to offer to the capitalist, nothing to tempt the economical; they hold out little promise of health to the invalid, and must be a purgatory to housekeepers of every grade. To have written thus honestly about a place of residence which the author yet apparently likes is an act as praiseworthy as it is rare.

Through France and Belgium in the "Ytene." By W. J. C. Moens. (Hurst and Blackett.) When the first page of a book introduces the author as hesitating what to do with himself for some months, the critic, taught by experience, is apt to anticipate a Puck-like girdling of the globe, followed by an alliterative title, or mayhap some fantastic enterprise such as those which have caused distant rivers and recondite fountains to echo the name of Rob Roy. Possessed, however, of a handy steamer of "eleven tons net register," and influenced, perhaps, by the lotus-like spells of the pretty creek of Fowey (little changed since, in the consulship of Plancus, the writer had to put shoulder to wheel in a bright moonlight and help the Royal mail into the ferry-boat), Mr. Moens calls upon us for no further exertion than is needful to proceed *via* Havre to Paris, and thence by Ghent to Calais. The route, indeed, is somewhat unusual, and if it were due to the counsels of a mysterious Egeria designated A. that he elected to encounter the locks, tunnels, and weighbridges of French and Flemish canals, we can but respectfully wonder at the lady's choice. We can, however, honestly welcome much of unusual information which our author has gathered in his frequently subterranean trip. The scale on which canal navigation is conducted will probably startle an English mind, little accustomed to locks one hundred feet long and sixteen wide, and we may at once say that throughout the work we have found the curiosities of the canals as interesting as the *Ytene* seems to have been to the enterprising maiden of the frontier who braved a fierce wind to satisfy her curiosity. Indeed, we must confess that the personal experiences of the author are far more to our taste than the *résumé* of Murray and abbreviations of history which occupy too large a portion of the volume. It was surely needless, after "trusting to be excused from giving a detailed description" of the private apartments of Compiègne, to describe them in detail; nor can the reader be expected to take much interest in the circumstances which obtained for the party the pleasure of a sermon from "a Canon of Lincoln." To Jacqueline of Holland, old friend though she be, we cannot willingly accord eight pages of print, and the imperial joke about Charles V.'s glove ought really to be put on the same shelf

with "Non Angli sed Angeli." There are one or two good bits of nationality here and there, such as the courteous but obstinate Dutchman's refusal to recognise what Mr. Moens' printer will persist in calling "a laissez passez," and the Englishman whose mistake between "bateau" and "bâton" led him to a bout at fisticuffs, and had nearly introduced him to a word which (he observed) was, luckily for him, the same in both languages—viz., a prison.

Three Months in the Mediterranean. (Stanford.) "Three Months in the Mediterranean" is not a pretentious title; nor does this small volume claim to record anything more than the impressions—first impressions they may be unhesitatingly pronounced—received in time and place above specified. That these impressions be honestly and, as in the present instance, pleasantly laid before the reader, is all that can be fairly demanded, and we are well content to revisit in Mr. Coote's company the oft-furrowed sea whose shores were empires, which her waters did not waste—being tideless—whatever Byron's printers may have said to the contrary. Our author, leaving Liverpool, might have spared us the (possibly inevitable) sea-sickness, which, having been vividly recorded by Dickens and solemnly anathematised by Thackeray, has fairly earned exemption from other sufferers. After a commendably brief glimpse of particoloured Gibraltar, we commence sightseeing with Genoa; and here *in limine* we must in all kindness protest against the funny nomenclature of sundry well-known spots, which must surely have been notated phonetically from some polyglot *valet de place*. The Cornice road need not be spelt Cornichi; and why, oh! why should we be told of "the chapel of Jean Baptiste"? The Precursor is surely well known enough to English readers of the New Testament, and need not be introduced under a French garb. Admiration for the noble breakwater at Leghorn must not warrant the ascribing its erection to either of the Napoleons, as the works were begun under Austrian sway, and all but completed when the last Grand Duke of Tuscany was "pitched, no parcel that needs invoicing, to the other side of the Mount St. Gothard." The drunken effect of mounting the Leaning Tower of Pisa is well described, but there is something funny in our author's wonderment at finding church bells hung in a belfry, and in his comparing the roof of the many-angled Baptistery to half an egg! The cathedral is not in black-and-white marble, though St. Lorenzo at Genoa is so. The next page transfers us to Naples, where we quote with pleasure a sentence:—"It was with a feeling almost akin to fear that I walked from the inn on the Naples road to the ruins" of Pompeii. Mr. Coote's enjoyment of the city's treasures is such as befits one who approached the spot with such reverence, and we must needs envy the simple faith with which he accepts as authentic the names of house-proprietors given by early excavators, who seem to have possessed a Pompeian Post-Office Directory for A.D. 79. The Battle Mosaic is perhaps the most interesting mosaic yet unearthed, but must not be spoken of as the greatest, while the Vatican and Lateran Museums, Palatrina and Athens are yet to the fore. But the strangest fiction—one that we feel almost sorry to destroy—is the assertion that on a necklace found in the cellars of the suburban villa near the gate of Herculaneum was inscribed the name of its owner—viz., Julie di Diomedé. This warrant of identity beats the bricks in Jack Cade's chimney which testify to his royal descent (see *Henry VI.*), and is rivalled only by a stone on the hill near Glastonbury where Joseph of Arimathea planted the Glastonbury thorn, which is inscribed "J. A., A.D. 33." Before quitting the shores of Italy in company with Mr. Coote, we must demur to his assertion that "the ancients" considered the colossal Farnese Hercules "the finest piece of sculpture ever wrought." Even if these be the "invicti membra Glyconis" of Horace—a doubtful point—the praise bestowed by Pliny on the Laocoon is far more elaborate.

Our author should have remembered the old remark that it was unnecessary to praise Hercules, as no one had ever thought of blaming him. The scene now shifts to the East, where the Alexandrian donkey boys, the pyramids, the Sphinx (to whose eternal glory *Punch* has lately added an amaranthine wreath), and the glorious gardens of the industrious but impecunious Khedive pass rapidly before us. But the scenes are accurate rather than life-like. We see the Esbekeyeh of Cairo, the beautiful harbour of Smyrna, but miss the poetic eye which saw on these spots Bedreddin Hassan asleep in his drawers at the city gate, and Ali Baba going out at early dawn with his donkey to cut wood. Even the Golden Horn is scarcely able to receive a new tint. There was no want of energy, however, in our rapid circumnavigator, and to this quality we owe some interesting glimpses of Ephesus, Tunis with the gigantic aqueduct near Roman Carthage, and, best of all perhaps, a gallop through the island of Elba, where the author's good humour under the torture of an Italian mule demands from ourselves equal leniency for the very funny spelling of the Elban seaports. May Mr. Coote's next vacation afford him and his readers equal enjoyment!

Arabistan, or the Land of the Arabian Nights. By Wm. Percy Fogg. (Sampson Low and Co.) This is an amusing book of Eastern travel, a great part of it being occupied with the by no means inaccessible, but still little visited, city of Bagdad and its neighbourhood. It is written in a light and humorous style, without degenerating into the buffoonery which has lately been too much in vogue among American tourists when they publish the journals which every traveller seems irresistibly impelled to keep. The author has evidently no great literary experience; he has no interesting discoveries to record; he met with no striking adventures, and (although he tells us that he contemplated visiting Central Africa, Mecca, and Babylon) he traversed no difficult or unknown region; and yet we are bound to confess that his volume is both instructive and entertaining. He begins, of course, with a sketch of the route from Europe to Egypt, and an account of Egypt itself; a trip from Jaffa to Jerusalem and back naturally occupies two or three chapters; the Suez Canal must be described, however familiar the daily papers have made most people with that triumph of engineering skill; the voyage up the Red Sea, that *bête noire* of Anglo-Indians, cannot be passed over without comment; but at length the reader is allowed to accompany him to Bagdad. This city, with its environs, is well described, and the lovers of the *Arabian Nights* will peruse with pleasure and profit the clear and straightforward account of the present aspect of the place, and the condition of its inhabitants. Unfortunately Mr. Fogg, like many of his travelling countrymen, is not a linguist, but he cannot forego the temptation to quote scraps of foreign languages, which, as may be expected, suffer dreadfully in the process. It is somewhat startling to be told that the Cajar dynasty of the Persian Shah is Kurdish in origin, and that the Persian native name for their country is *Iranistan*. That *Yankeedonia* (for *Yenidunya*), "New World," is an Arabic word, instead of a Turkish-Arabic compound, is also a new philological light. Chapter xx. contains an account of Bedouin manners, obviously compiled from the pages of Burckhardt and the notes to Lane's *Arabian Nights*. Although the individual statements in it are correct, the description as a whole would not apply to any single existing Arab tribe. Mr. Fogg, however, confessedly writes for the mass of the American public, who, to use his own words, "have no definite ideas as to what Mahomet taught and the religious observances of his followers;" and, if we make allowances for these inaccuracies, we shall find that the book presents a very graphic picture of the East as it appears to an outsider, and this is all that a traveller of the class aims at conveying. Mr. Fogg found Bagdad the most typical Oriental city

in the world, and his descriptions of the bazaars, mosques, people, and street scenes are very pleasant reading. The illustrations, which are plentifully scattered throughout the book, are very unequal in merit; there are a few really good full-page engravings of some of the principal sites visited by the author, and there are a number of indifferent woodcuts representing various humorous incidents in his voyage. Added to these are a good many illustrations, copied without acknowledgment and not too exactly, from the pages of Layard, Lane's *Arabian Nights*, and other English works. The book is not one that adds much to our knowledge, or to which a scholar would refer for information; but it would serve well to while away a spare half-hour, and it certainly inculcates one moral—namely, that, if one has sufficient time, money, and energy, one may travel quite as easily and comfortably in the "Land of the Arabian Nights" as in most tourist-frequented parts of the continent of Europe.

To Jamaica and Back. By Sir Sibbald David Scott, Bart. (Chapman and Hall.) Sir Sibbald David Scott went to Jamaica with a return ticket in 1874, and remained in the island less than three weeks. It is a pity that he has been persuaded to figure among authors. The journal which he kept during his absence from England, and which forms the basis of the present work, is of that lively kind which makes pleasant reading for the writer's family and may fairly be handed about among his friends, but ought to go no further. One sea voyage is very like another: the weather first, the food next, and then a description of the passengers, and all is told. Of Jamaica itself there is not much that is new to be learned, and Sir Sibbald has not contributed to our knowledge. He has added to his journal three chapters containing a *precis* of the history of Jamaica taken from Gardner's *History*, and Bridges' *Annals of Jamaica*. It is as well here to correct what is doubtless a typographical slip; Jamaica is stated to contain 400,000 acres, which must be a misprint for 4,000,000.

Chinese Sketches. By Herbert A. Giles. (Trübner.) The sketches in this volume owe their existence chiefly, Mr. Giles tells us, "to frequent peregrinations in Chinese cities, with pencil and notebook in hand." They do not pretend to be exhaustive treatises on the subjects they refer to, but simply give such general notices on everyday topics as may be found in the columns of newspapers or in the pages of magazines. Some have already seen the light in a Shanghai periodical, and these, having been submitted to the process of revision, reappear now in company with fresh matter in their present form. Many of these essays are decidedly interesting—such, for instance, as those on etiquette, on the state of the medical art in China, on loan societies, and others—but the extreme brevity of most of them has given in some instances an appearance of crudeness to Mr. Giles' opinions which would possibly not have been the case were the subjects treated at greater length. For example, his remarks, as they stand, on the literature convey a very undue depreciation of its value. A large portion of it is doubtless contemptible—witness such street-literature and works of medicine as are referred to by Mr. Giles—but, on the other hand, there is, to speak of nothing else, a vast amount of ethnological and geographical information which is as yet only partially revealed to the world in general, and which can never be fully known until the contents of the works of Chinese authors on those subjects shall have become public property. Nor can we suppose that Mr. Giles wishes it to be understood as the result of any investigation on his part that, as he would appear to imply, "only thieves and bad characters who have nothing to lose avail themselves of Christian baptism, as a means of securing 'long nights of indolence and ease' in the household of some enthusiastic missionary at from four to ten dollars a month." Unfortunately the book has been written with an object, and in

common with all such books it inherits the vice of one-sidedness. In its pages Mr. Giles has undertaken to reverse most of the opinions which have been previously formed on the moral and physical condition of the Chinese; and this he attempts to do, not by well-digested arguments based on the stern logic of facts, but by unsupported assertions which amount only to the expression of his individual opinion. China is a vast empire, and it is dangerous, even with an unbiased pen, to generalise on the condition of her 400,000,000 of inhabitants from an acquaintance with the few thousands who are to be met with at the Treaty Ports.

Six Months in America (Zes Maanden in Amerika). By Dr. M. Cohen Stuart. (Haarlem.) An intelligent and apparently trustworthy account of the United States by a Dutch clergyman who went over to New York in 1873 as a delegate to the Evangelical Alliance—that "grand cosmopolitan conclave of Christian captains," as one of the American papers somewhat flowingly described it. His friends—and he found many—were mostly, as we should say, clerical; but American religion and religious organisations are not the least interesting subjects of study. Nowhere, he says, is there so little intolerance as in America, and he preaches a sermon to his Dutch countrymen from that text. Indeed, his chief object is to be, in a humble measure, the Laboulaye of Holland—that is, to indicate the improvements which might be introduced at home from the Republic of the West. Perhaps he is somewhat partial in his estimate of the latter. That sectarian differences in Holland are specially characterised by animosity is exactly what does not strike a visitor from England. But Dr. Cohen Stuart (he is not a doctor of Leyden, but of New Brunswick) has eyes for other than religious peculiarities. The practical spirit of the Americans finds in him an almost too enthusiastic admirer. Not the least valuable part of the book is the account of the American colleges, though we could have wished for further details as to the scientific quality of the education supplied. We gather that the author has in reserve a fuller account, which he proposes to publish separately. He notices with gratification the prosperity of the Dutch element in the States, and mentions, as a matter of antiquarian interest, that several words (*e.g.* boss) have survived from the old Dutch period, and become part and parcel of the New York dialect, just as the "knickerbocker" families have of the New York population. It was Dr. Cohen Stuart's work to find out the Dutch colonies and preach to them in their mother-tongue, and as his English hosts had an equal avidity for sermons, his lungs must have been pretty well exercised during his six months' visit. The work is a good specimen of the truly elegant Dutch typography.

Country Life in Syria; Passages of Letters written from Anti-Lebanon. By Harriet Rattray. (Seeley.) Syria has an evident attraction for the lady visitor or settler from the West, and its atmosphere is clearly favourable to the development of womanly thought. Nor has its romance been destroyed by the mail-coach running between Beirut and Damascus, with its prepared road, duly organised stations and changes of horses, established in these practical and utilitarian days by a matter-of-fact French company. In support of this view may be cited a new collection of papers under the title above shown, apparently fragments of by-gone correspondence, and illustrated by very fair and truthful sketches. These letters, commencing in December, 1863, and ending in October, 1875, describe with much intelligent force the life of the authoress and her husband, who farm the village lands of Khoraibeh in the Anti-Lebanon, but whose residence is rather in the plains of Coelo-Syria. Readers who—independently of Lamartine, the author of *Eöthen*, and other modern authorities—are familiar with the charming volumes published fifteen years ago

under the title of *Egyptian Sepulchres and Syrian Shrines*, will not need new pictures of the mountains and valleys of the Lebanon, of Druse or Maronite, or of sacred cedars and time-honoured ruins, to which the way is open from Beirut and neighbouring ports. Much the same ground has, moreover, been quite recently trodden and described by a lady whose *Inner Life in Syria* is a book of no common merit. But they will readily welcome sketches of men, women, and animals, and of an out-door life which is the very antithesis of the *salon* and resorts of high-class civilisation. If objection exist to the mention, sometimes in tolerable detail, of snakes and scorpions, flies and locusts, fleas and "unmentionables" (the author's word), hornets, spiders, and other living annoyances; or if exception be taken to the display of a too shady side of Syrian character; there is, on the other hand, much genuine representation and instructive small-talk to recommend the unpretending volume under notice. We conclude with an extract from its pages which may be useful to mistaken phil-anthropists. Domestic or hereditary slavery is not to be confounded with that wretched condition of existence peculiar to the living cargoes of slave-ships; but we fear the distinction is not always rightly apprehended. Letter V. is discussing the habits of the Syrian people in their household relations:—

"The mother of the family is treated in the most outrageous manner. She is sworn at by her daughters, and cursed, beaten, and overworked by her husband and her sons; and when too feeble to perform her ordinary tasks, she is made to feel continually that she is a burden to the whole family. In cases where people are too wealthy to begrudge the food of the mother or grandmother, the old folks suffer less; but they meet with abusive, disrespectful treatment from every one. . . . Black slaves are to be met with in most of the large houses. They are invariably kindly treated—spoiled, we should consider in England. You would be astonished to see the servants of a rich man following him into any house at which he is paying a visit, seating themselves in the sitting-room, joining in the conversation, actually interrupting their betters in the midst of a sentence, coolly examining any knickknacks that lie about, and, if the master stays rather long, saying, in a free and easy manner, 'Come, it is quite time for us to go; are you going to remain till midnight?'"

NOTES AND NEWS.

THE Clarendon Press is about to publish a new edition of the late Mr. Finlay's *History of Greece under Foreign Domination*, corrected and improved by the author, and in parts re-written. The principal additions are: in Vol. I., "Greece under the Romans," an essay on the depreciation of coinage by the Roman Emperors; in Vol. IV., "Mediaeval Greece and Trebizond," which has been so altered as to be almost a new work, an essay on the commercial relations of the Venetians with the Byzantine Empire, and a full account of the Duchy of the Archipelago or Naxos; in Vol. V., "Greece under Ottoman and Venetian Domination," an account of the Genoese Trading Company in Chios. The supplementary chapter to the "History of the Greek Revolution" (Vol. VII.) contains the history from the end of 1843, when the published work concludes, to 1864, after the accession of the present sovereign. This work, which is to be edited by the Rev. H. F. Tozer, will be published for the University of Oxford by Messrs. Macmillan and Co.

A NEW and cheaper edition of Mr. Hilton's *Lectures on the Therapeutic Influence of Rest and the Diagnostic Value of Pain*, which have for some time been out of print, is in the press, and will be published shortly. It will be edited by W. H. A. Jacobson, F.R.C.S., assistant-surgeon to Guy's Hospital, and will contain additional woodcuts.

MESSRS. BEMROSE AND SONS are extending the

scheme of their Railway Panoramic Guides to the Scotch lines. They have in preparation descriptive Guides to the Glasgow and South Western and North British railways.

FROM the Thirty-Seventh Report of the Deputy Keeper of the Public Records, just issued, we learn that Mr. Rawdon Brown has continued the sixth volume of his *Calendar of State Papers Preserved in the Venetian Archives* down to the year 1556, and has transmitted ten more volumes of transcripts of documents relating to British affairs. There are now eighty-four volumes in all of these materials for our history deposited in the Record Office for the use of students and historians. M. Armand Baschet has continued his researches for documents relating to British history, and has forwarded some valuable transcripts from the National Library of France and the office of the "Archives des Affaires Étrangères," together with a list of French Ambassadors in England from 1509 to 1714, which is printed in the Appendix to this Report. The Rev. Joseph Stevenson has also continued his researches in the Vatican Archives and other libraries at Rome for like materials, and has transmitted many copies of important documents illustrating our affairs. Some obstacles mentioned in a previous Report of the Deputy-Keeper having been removed, Mr. Stevenson states that every facility is now afforded him at the Vatican. Six volumes of the works in the series of *Chronicles and Memorials of Great Britain and Ireland during the Middle Ages* have been issued under the direction of the Master of the Rolls during the past year, and three more are nearly ready. Upwards of 30,000 copies of the volumes in this series have been sold since its commencement.

MESSRS. SOTHEY, WILKINSON AND HODGE sold last week a copy of the first edition (Kilmar-nock, 1786) of *Burns's Poems*, with an Elegy on the death of Sir J. H. Blair in the autograph of the poet prefixed, for 38*l.* 10*s.*; and Rogers's own copy, with autograph notes, of his *Italy and Poems*, for 6*l.* Copies of the first edition, on large paper, of Bewick's works realised the following prices: *History of Quadrupeds*, 15*l.*; *History of British Birds*, 11*l.* 15*s.*; *Fables*, 11*l.* 5*s.* A "Vinegar" edition of the Bible fetched 4*l.* 13*s.*, and a subscriber's copy of Halliwell's *Shakespeare*, 51*l.* Among some manuscripts sold were a *Biblia Hebraica*, on vellum, written in Spain in the fourteenth century, 28*l.* 10*s.*; and *Johannis Damasceni de Orthodoxa Fide Liber*, 14th century, in the original oak boards, 14*l.* *Hœures a Lusinge de Rome*, a work printed on vellum at Paris in 1518, with autograph of Jeanne Hubig-neau, sold for 15*l.* 15*s.* Among other rare and curious works offered were *The Holy Bull and Crusado of Rome*, black letter, 1588, with pretended signature and notes of Shakespeare, 11*l.* 10*s.*; Bate's *Mysteries of Nature and Art*, 1635, 2*l.* 17*s.*; and Benzon's *Historia del Mondo Novo*, Venice 1665, 3*l.* 4*s.* A beautifully-illuminated manuscript, *Champ de Drap d'Or*, an account of the interview between Henry VIII. and Francis on the Field of the Cloth of Gold, sold for 90*l.* Some scarce and valuable topographical works were also disposed of by the same firm. These included Clutterbuck's *Hertfordshire*, 3 vols. in 6, on large paper, with additions, 139*l.*; Nichols' *County of Leicester*, 4 vols. in 8, on large paper, 90*l.*; Dugdale's *Warwickshire*, 11*l.*; Drake's *Eboracum*, 9*l.* 10*s.*; Chauncy's *Hertfordshire*, 7*l.* 15*s.*; Baker's *County of Northampton*, 19*l.*; and Lipscomb's *County of Buckingham*, 8*l.*

SATURDAY, July 29, being the eightieth birthday of the poet Christian Winther, was held as a festival by the Danish students. An address of congratulation from the city of Copenhagen was telegraphed to his residence in Paris. Winther is the greatest lyricist Denmark has produced.

IN John Lane's *Tom Tel-Troth's Message and his Pen's Complaint*, 1600, which is one of the

Shakspeare's-England tracts that Mr. Furnivall is re-editing for the New Shakspeare Society, occurs a stanza which may be fairly taken as an allusion to Shakspeare's *Venus and Adonis* and *Lucrece*. As it did not find its way into the last collection of such allusions, we give it here, though it may have been noticed elsewhere before:—

STANZA 109.

"When chast *Adonis* came to mans estate,
Venus straight courted him with many a wile;
Lucrece once scene, straight *Tarquine* laid a baite,
 With foule incest her bodie to defile:
 Thus men by women, women wrongde by men,
 Giue matter still vnto my plaintife pen."

It occurs in the author's treatment of the seventh Deadly Sin, Lechery, in Shakspeare's time.

THE *Schlesische Presse* gives an account of some recent researches made by the Bolognese historian Carlo Malagola with reference to the nationality of Copernicus. He has come upon the almost complete series of the "Acts" of the *Natio Germanica* of the University of Bologna. It seems that the name of "Nicolas Kopernikus" was first inscribed in the Bologna registers in the autumn of 1496, as a student of the canon law, belonging to the "German Nation" in the University, to which also his uncle Watzel-röde had belonged, who was a student at the same University from 1470 to 1473. In 1498 his brother Andreas came to Bologna, also for the purpose of studying the *jus canonicum*. Two years later, both brothers went to Rome, leaving Bologna without taking any degree. Nicolas Copernicus did not become Doctor until 1507, after his second return from Italy. The stay of Copernicus in Padua, and the inscription of his name in the *Album Polonorum*, says Malagola, is a mere tale, of which not a word is true. He has discovered the names of the teachers of the astronomer. He studied mathematics under Scipione del Ferro, the Greek language under Urico Cadro, and Astronomy under Domenico Maria Novara.

THE Augsburg *Allgemeine Zeitung* gives an account of Alex. Fredo, "the Polish Molière," who died at Lemberg on July 16. He was the founder of the Polish comedy. He differed from his Polish contemporaries, says the writer, by overleaping the narrow bounds which they set themselves and writing for a wider circle; his works have been translated into other languages, and rendered in many non-Polish theatres. The biographer thinks that his numerous comedies will continue to live. He was born in Galicia in 1793, entered the Polish military service in 1809, laid aside soldiery and took up authorship in 1814. For the last forty years of his life he wrote nothing.

THE second instalment of Mr. Spedding's examination of Lord Macaulay's essay on Bacon in the *Contemporary* deals exhaustively with the case of Essex. It throws no new light on the merits of that case, but a great deal on Lord Macaulay's method of working. Prof. Lightfoot's eighth article on "Supernatural Religion" deals with the letter of the Churches of Vienna and Lyons, and with Irenæus. There is a telling exposure of the preposterous assumption that our Gospels could have been unknown and unused at Lyons twelve years at most before Irenæus wrote his third book, which the author of *Supernatural Religion* only brings down to A.D. 190 by arguing boldly to the date of Theodotus from a passage of Epiphanius which is full of blunders; a method of procedure which, as Prof. Lightfoot remarks, does not entitle him to put Irenæus out of court as too uncritical to be a credible witness to simple matters of fact. Mr. Peter Bayne has a second article on Clarendon as unctuous and magisterial as his first; the assurance with which he corrects Von Ranke is especially admirable.

PROF. CAMPBELL's concluding article on the "Revision of the English New Testament" insists on a series of changes which would seriously disparage the Athanasian doctrine of the Trinity and the Incarnation. S. R. Gardiner has a very curious and instructive paper on the political element in Massinger. The *Bondman* is referred to the period of Pembroke's opposition to Buckingham, then lately appointed Lord Admiral, and Middlesex. The *Great Duke of Florence*, written when the Herberts were reconciled to Buckingham, has one or two allusions to Buckingham's high favours. *Believe as you List* was not licensed on political grounds. It is shown that Antiochus represents Frederick of Bohemia as much as or more than Sebastian of Portugal in his remorse for the unsuccessful enterprise undertaken in defiance of the warning of friend and foe (James and Maximilian of Bavaria), his unsuccessful application to Carthage (an allegory for Holland), while Prusias is Charles, Philoxenus Weston, and Flaminus Colonna, the Spanish ambassador. In the *Mind of Honour* Ferdinand of Urbino is Frederick again. Robert King of Sicily is James, whose conduct is represented from the popular point of view as altogether contemptible. The reason for attacking James, Mr. Gardiner thinks, is that Charles was just then supporting Gustavus in the same half-hearted way in which his father had supported Frederick. Lord Blachford proves from Mill's *Autobiography* that Benthamism is not an adequate rule of conduct for finely-strung natures, and that Mill's later moral theories were not very consistent: he appears from his title to regard these facts as illustrations of the reality of duty.

IN the *Fortnightly Review* D. Mackenzie Wallace's account of the territorial expansion of Russia is clear and interesting, especially as showing why it was easier to colonise the forests than the steppes. There are some odd details as to the present half-converted state of the Finnic tribes of the North. The editor's first paper on Robespierre, who is represented as a "pedant cursed with the ambition to be a ruler of men," carries us down to August 10, 1792. James Sully gives a good *précis* of "Hartmann's Philosophy of the Unconscious," with some criticisms for the most part more contemptuous than penetrating. That he does not convince professed metaphysicians and physicians and does convince men of the world, whom they do not convince, does not prove his speculations to be worthless: it is only an illustration of the general rule that science and common sense seldom are perfect enough to reach the same results by different roads and express them in equivalent terms. When the results of science and cultivated common sense differ, either may be right or both may be wrong.

IN *Macmillan* Sir Bartle Frere begins a summary of the information about the Khojas that came out in the trial before Sir Joseph Arnold, which established that Mohammad Hussain Hooseini, otherwise Aga Khan, is the hereditary chief and unrevealed Imam of the Ismaili, and heir-at-law to the Old Man of the Mountain. The Rev. W. J. Loftie has a clear and readable paper on the physical geography of the country between Hampstead and Sydenham, called "London Before the Houses." J. Oxenford's paper on the Brigands of Bulgarian Song suggests a reflection that the brigands of Bulgaria have inherited the trappings of purely mythological beings, which is certainly the case with the outlaws of Iceland, and probably with the outlaws of Sherwood.

IN the *Cornhill* there is a collection of Buddhist aphorisms from Japan which circulate under the name of the teacher who established Buddhism there: they are quite unspiritual. Mr. Austin Dobson's stanzas on the "Child Violinist" make an obvious point very skilfully. "When the Sea was Young" is a description of the condition of things when the earth was too hot for water to

rest on it and when its atmosphere was far larger than now, illustrated by references to the belts of Jupiter and the square-shouldered appearance of Saturn, which it is assumed are now in the state through which the earth passed long ago.

IN *Belgravia* R. A. Proctor gives an account of the Lunar Hoax which Niccollet devised to avenge himself on Arago, and R. A. Locke expanded to the admiration of the American public.

IN *Temple Bar* there is a story of a "Famous Excommunication" launched against the thief of one of the first three olive plants imported into Peru, who was not detected till he had made his fortune by the theft, when he made restitution handsomely.

IN *Fraser* Dr. Sandwith describes a journey from Belgrade to Constantinople. He finds that the Circassians have become very shabby by reason of their transfer to Europe, but observes that Midhat Pasha's roads round Nisch (which are still kept up by the Government and will soon be kept up by the people) are better than any in Servia, and, in fact, good enough for England. Colonel H. A. Browne gives a convenient summary from French sources of the history of Cochin China, and the steps by which the French have established their ascendancy there. The "Burmese Tale" is of the common type. One act of good-nature miraculously remained; it has received a Buddhist colouring. "J. A. F." thinks he can tell Cicero's story of the case of Cluentius better than Cicero, that the whole of this story is certainly true, and that the senatorian judges under Sulla's constitution were all pure patricians: it is doubtful whether half of them were even "noble." The paper is called "Society in Italy in the Last Days of the Roman Republic." The writer turns with weariness and distrust from the philosophy of history, from attempts to explain the phenomena of earlier generations by referring them to general principles.

OBITUARY.

CHILDERS, Prof. R. C., July 25, aged 38.
COLLINS, Mortimer, at Richmond, July 28, aged 49.
HENRY, Dr. James, near Dublin, July 14, aged 78. [Author of many curious researches and studies on the *Aeneid*.]
LONSDALE, Dr. H., at Carlisle, July 23, aged 60. [Author of *Worthies of Cumberland*.]

SIR J. W. KAYE.

THE death of Sir John William Kaye, K.C.S.I., F.R.S., on the 24th ult. leaves a blank not easily filled among our writers of current history. British India has been fortunate in possessing a chronicler of so much official experience and literary power—one who could impart a charm to his narrative without rejecting those manifold details which, however dry in themselves, essentially belong to the pages of a faithful record, but which in unskilful hands become wearisome and unreadable. His published volumes are too familiar to the reading public to need particular enumeration. Those which have justly won for him the highest reputation, and have raised a lasting monument of his ability and usefulness, describe the *War in Afghanistan*: they form a work combining the attractiveness of romance with the worth of historical reality. Of another well-known history, the *Sepoy War in India*, he wrote many brilliant pages, and had probably achieved three-fourths of his contemplated task; but he never lived to complete the record. As a biographer he has laboured to good purpose. The careers of distinguished Indian Administrators must always be full of instruction and example to those called upon to play a part, however small, on the stage of Indian government; and Kaye's materials in this respect have not been frittered away or wasted. Malcolm's *Life*, to take an instance, is just what it should be—just what it professes to be, and no more. The writer never suffers himself to stray from his subject; nor does he at any time appear

to wish to stray. We might object to the book, had it been an account of our dealings with Sindia, Holkar, and the Shah of Persia. Not a word of objection can be offered to it as the *Life and Correspondence of Sir John Malcolm*. Among later and less conspicuous publications, the Memoir of Bishop Wilson of Calcutta will not have been overlooked by the readers of *Good Words*; but the sweetly-expressed thoughts pervading the sonnets of April and December, 1874, in the same serial, should have an especial interest for admirers. Sir John Kaye was in the sixty-third year of his age. Born in London, in 1814, he passed out, as a young man of eighteen, from the East India Company's Military College at Addiscombe into the Bengal Artillery. Resigning the service in 1841, he betook himself to literary pursuits; and after a period of some three or four years, during which he started the *Calcutta Review*, he left India to commence a professional literary career at home. In 1856 he joined the Home Civil Service, and was eventually appointed Secretary in the Secret and Political Department of the India Office, a post which he filled from the transfer of the Government of India to the Crown up to his retirement from public life in 1874. In recognition of his long and important services to the State he was, in 1871, enrolled among the Knight Companions of the Star of India. His loss will be much regretted by many who had the advantage of his personal acquaintance and could appreciate his kindness of disposition. Independently of high intellectual attainments, he was a warm-hearted and sincere friend and genial companion. He was one of the officers serving on the General Committee of the Royal Literary Fund. F. J. GOLDSMID.

PROFESSOR CHILDERS.

WHEN noticing lately the death of Prof. Lassen, who just fifty years ago published, with Eugène Burnouf, the first European work on Pāli grammar, we little expected to have to deplore so soon the loss of the scholar who has done more than anyone else to advance the knowledge of Pāli and Buddhist literature. Prof. Childers, who was the son of the Rev. Charles Childers, English chaplain at Nice, first began the study of Pāli in Ceylon, having been appointed to the Ceylon Civil Service at the end of the year 1860. For three years he acted as private secretary to the then Governor, Sir Charles McCarthy, and had become Assistant Government Agent in Kandy, when ill health compelled him in March, 1864, to return to Europe. While in the service he had taken great pains to understand the modes of thought and feeling of the Sinhalese, and gave up one of his vacations to acquire a more thorough knowledge of the native language and literature than was required by the rules of the Service: those who have realised how precious are the few holidays and leisure hours of a hardworked official in the East will know how to appreciate such an act. It was in this vacation, spent at the Bentota Rest-house, that he began the study of Pāli under the guidance of Yātrāmulle Unnāse, a Buddhist scholar of great learning, and of peculiar dignity and modesty, for whom his distinguished pupil retained to the last a deep personal regard. After his return home Mr. Childers greatly improved in health, but did not at first intend to carry on his Oriental studies; indeed, it was chiefly owing to the advice and encouragement of Dr. Rost that he was induced in the autumn of 1868 to recommence in earnest the study of Pāli. Already in November, 1869, he published his first contribution to the literature of the subject—the Pāli text of the Khuddaka Pāṭha, with an English translation and notes (*Journal of the Royal Asiatic Society*). With the exception of Fausbøll's *Dhammapada*, this collection of Buddhist hymns was the only part of the Buddhist *Piṭakas* actually printed in Europe; and it is a striking proof of the author's

genius that later investigation should have revealed no blot on this early work. The greatest obstacle to any real knowledge of Pāli was the want of a Pāli dictionary, and this want Mr. Childers set himself to supply; though it was a task from which many a scholar less enterprising and less self-sacrificing would have shrunk. To this work he devoted the following years, the work gradually rising in aim and scope under his hand; and the first volume was only published in 1872. In the meanwhile he published his views on Nirvāna first in *Trübner's Literary Record*, in 1870, and afterwards in his *Notes on the Dhammapada*, in the *Journal of the Royal Asiatic Society*, May, 1871, completing and summing up the discussion in the long article on Nibbāna at the close of Volume I. of the Dictionary. It is not too much to say that these papers have finally settled a much-debated question as far, at least, as to the meaning of Nirvāna as used in the *Piṭakas* themselves. In the autumn of 1872 he was appointed sub-librarian at the India Office. Early in 1873 he contributed a paper on Buddhist metaphysics to Prof. Cowell's edition of Colebrooke's *Essays*, and commenced a series of papers in the *J. R. A. S.* on the Sinhalese language. In the same year he accepted the appointment of professor of Pāli and Buddhist literature at University College, London—the first instance of a professor being appointed specially for this subject. In 1874 was published the first part of his edition of the *Mahā-parinibbāna Sutta*, that part of the *Sutta Piṭaka* which gives an account of the last few days of the life of Gautama Buddha. In 1875 appeared the second paper on Sinhalese, in which that language was conclusively proved to be of Sanskrit and not of Dravidian origin. During these years Prof. Childers was sedulously engaged in completing the second volume of his Pāli Dictionary, which, much larger and fuller than the first part, was published only in the autumn of last year. This great and important work has already been welcomed throughout Europe as the most valuable contribution that has yet been made to the knowledge of Pāli, and as the foundation of all future study of that language.

After the completion of the dictionary, Prof. Childers with unwearied zeal looked forward to renewed activity. Early in 1876 appeared the second part of the *Mahā-parinibbāna Sutta*; he had undertaken, with Mr. Fausbøll of Copenhagen a complete edition of the Buddhist *Jātaka Stories*, and he had promised to contribute translations from the *Piṭakas* to Prof. Max Müller's projected series of translations from the Sacred Books of the East. He was also working at the completion of his long-announced *Pāli Grammar*, and contemplated editions of several Pāli texts which he had already transcribed and made use of for his dictionary. But all this was not to be. Rapid consumption followed upon a cold contracted in the early part of this year; and he passed away on Tuesday, the 25th ult., at Weybridge, in the thirty-eighth year of his age. It is almost impossible as yet to realise how great the loss has been to science. To an unusually powerful memory and a penetrating intellect Prof. Childers united an indomitable energy, and above all a singleminded devotion to truth, and an earnestness in the cause of research, rare even among students in new and promising fields. His mind was singularly open to new ideas; he was most generous in his appreciation of others; and so little was he troubled with that dislike of opposition sometimes found in literary men, that he was glad to welcome corrections from any quarter, and was often the first to point out his own mistakes. In thinking of him now two names rise involuntarily to the mind: those of James Prinsep and Eugène Burnouf; and with the last especially his memory will always be associated. The accomplished countrymen of Burnouf, who have done and are doing so much in similar studies, will be gratified to know that the graceful tribute paid to his genius by the In-

stitute of France, in adjudging to him the Volney Prize of 1876, for the best philological work of the year, was announced to him in time to give him pleasure during the last days of his life. Outside the circle of Oriental students the large number of those who are interested in the history of religious belief will feel how inexpressibly sad is the premature death of a scholar who had, indeed, accomplished much, but whose promise was even greater still; and Orientalists will never use the name of Prof. Childers without a tender feeling of reverent and of grateful regret.

T. W. RHYS DAVIDS.

MR. MORTIMER COLLINS.

THE death of Mr. Mortimer Collins, in early middle life, will cause sincere regret, not merely to his personal friends, but to that part of the reading public which knew him only in his literary character of novelist and poet. His novels, of which there are several, are almost avowedly extravaganzas—indeed, he gave one of them, by no means the most fanciful, the alternative title of *Midsummer Madness*—and have not, so far as general popularity is concerned, obtained more than a *succès d'estime*, since they do not appear, as a rule, to have reached second editions, far less to have ever passed from the circulating-library form into the more convenient and inexpensive shape of railway-stall literature. Nevertheless, their merit is much greater than that of the majority of the recent tales which have obtained this label of success; for they are one and all lively and readable, besides exhibiting to the initiated a level of culture in the best English and classical learning (perhaps a little too much displayed now and then), which is very uncommon in caterers for public amusement. Probably, had Mr. Collins confided his own opinions about his novels to his friends, he would have based their claims to attention on their wit and their social philosophy. But this would have been like Liston's secret belief in himself as the great tragedian of his age. There is humour very often; there are slashing and telling onslaughts from the High Tory side on many idols of the market-place; and there is a full-blooded animalism, as distinct as may be from prurience, or even grossness, which makes him recall at times the plain-speaking of Fielding's day, and thus lessens the suitability of his works for young ladies' schools, albeit those institutions probably would be found to admit really objectionable matter at times, in which strict verbal propriety has been more carefully studied than by Mr. Collins in his innoxious, if slightly Bohemian, fictions. But wit and philosophy are absent, and, to say the truth, are not missed by his readers. It has been objected to him by critics that he was too fond of giving bills of fare in his novels, and of exhibiting the catholicity of his gastronomic tastes by running up the culinary gamut from cheese and beer to Tokay and Pressburg biscuits. And, in fact, the feats of some of his heroes are almost equal to those of Hercules in the *Alceste*, or of Gargantua himself. But even if he did not reply in the weighty aphorism of Brillat-Savarin, "*Les animaux se repaissent; l'homme mange; l'homme d'esprit seul sait manger*," he might have truthfully retorted that there is much more cookery and eating in such popular American novels for the young person as *The Wide Wide World*, *Queechy*, *The Gayworthys*, and so forth, without a solitary voice having been lifted in deprecation. As a poet, without ever aiming very high, or, indeed, at doing more than producing facile *vers de société*, Mr. Collins succeeded more nearly than either Mr. Frederick Locker or Mr. Austin Dobson in reproducing the peculiar lyrical flow of the best and easiest French *chansons*, so that he suggests, at however great an interval, Béranger rather than Præd. The gift may not be accounted a very brilliant one, but it is so extremely rare (far rarer than more solid poetical qualities) that critics cannot afford to depreciate it, and many far more

pretentious minor singers of the day could have been much more easily spared than Mr. Mortimer Collins.

RICHARD F. LITTLEDALE.

NOTES OF TRAVEL.

LIEUTENANT CONDER has proposed a new site for Emmaus. He finds at the required distance from Jerusalem a place now called *Khamasa*. The word is one of the forms (Emmaus itself—modern *Amwās*—being another) in which the Hebrew *Hammath* might appear in modern Arabic. The place is undoubtedly ancient; there are remains of rock-cut Jewish sepulchres; a tradition of sanctity attaches to it; the ruins of an old Christian Church stand there; and it is on an old Roman road. He also finds near Ain Feshkah, and not far from De Saulcy's proposed site of Gomorrah, a name which preserves, while De Saulcy's name *Kumran* does not, the equivalents of the Hebrew. The name is *'Amriyeh*, and it is applied to a *Tûk* or "table-land," and to a large valley close to the Ras Feshkah. He has further discovered a name and place in his notes which he suggests may be the long-sought-for Ramathaim Zophim. The place is now called *Suffa*. Its claims are, briefly, that it is within the boundaries of Mount Ephraim; it is close to Beth Horon, which was given to the Kohathite Levites; it is the proper equivalent of Zuph (plural Zophim); Samuel was the descendant of a certain Zuph and belonged to the Kohathite Levites; in the required neighbourhood, if *Suffa* be Ramathaim Zophim, lies a place which Lieut. Conder proposes for Sechu: and there is also at *Suffa* a sacred place called *Sh'ehab ad Din*, the "Hero of the Faith." The arrangement and examination of the Survey notes suggest every day more of these identifications, of which the above are the three most important of those recently made. Lieut. Conder is now devoting his attention entirely to the preparation from his notes of the memoirs which will accompany the great map. As a collateral branch of work he has been studying Samaritan topography in the Samaritan Book of Joshua and the Samaritan Chronicle. The result of this investigation and a comparison with his notes have given him materials for a long and valuable paper on the whole subject, which will probably appear in the next *Quarterly Statement* of the Palestine Fund.

M. LOUIS SAY, writing to the Secretary of the French Geographical Society, announces his intention to make a new journey of exploration in North Africa with M. Largeau during the coming winter. The chief object is to endeavour to open up the commercial routes between the basin of the Niger and Algeria, and to make the ports of the French colony the outlets of these lines. The travellers will try to penetrate the country of the Touareg, and to explore the mass of mountains of Ahaggar, following up the work of M. Duveyrier, endeavouring so to conciliate the Touareg, who command all the routes, as to be able to entrust them with the conduct of future caravans. M. Say and M. Largeau will leave Constantine together, going south to Biskra, Tuggurt, and Wargla, where they will separate: M. Largeau, with an Arab escort, going south-west to Insalah; M. Say, with a following of Kabyles and Touareg, keeping south directly to Temassinin and Idelès. While M. Say is exploring in Ahaggar M. Largeau will go on to Timbuctoo.

IN the July number of *Petermann's Mittheilungen*, the traveller Gerhard Rohlfs criticises the results of M. Largeau's second journey to Rhadames, in 1875, and the failure of his attempt to turn the caravan traffic of the Oasis from its natural channel through Tripoli towards an Algerian port; pointing out also that M. Say's assertion of the increasing sympathy of the Touareg race with the French is in direct opposition to the known facts that the Touareg have no political organisation, but are simply an ethnographically-connected race, with whose many divisions and

tribes it would be impossible to enter into lasting relations of friendship. The chief reason, he maintains, why Algeria had not become a French province, as it might have been made, is that its native Berber and Arab peoples have never assimilated, but remain constantly a separate element of population, though French officials and travellers talk constantly of a sympathy which does not exist. Peaceable colonisation will only be possible after the natives have been driven backwards forcibly into the deserts. The same number of *Petermann* contains an important article on "The Ethnographic History of European Turkey," by F. von Stein, which is of great interest at the present time. On a large map which follows this paper the scattered areas of the country occupied by purely Turkish populations are brought out distinctly, as well as the distinction of religion—Mohammedan, Christian, or Jewish—in each Sanjak of the Empire.

THE *Journal* of the Geographical Society of Berlin for this month is chiefly occupied by the continuation of the report of the *Gazelle* expedition, containing descriptions of the banks of the river Congo from Banana to Boma, and Dr. Studer's zoological observations in the same region. To a general account of the *Gazelle's* work in the island of Kerguelen are appended Dr. Husker's zoological observations, and Dr. F. Naumann's paper on the "Flora of Kerguelen." Dr. H. Kiepert contributes a paper on the "Cartography of European Turkey," a subject on which he is certainly the highest authority. The geography of this portion of Europe, the only part of the Continent in which no general survey has been begun by its Government, still rests upon very fragmentary, and often very unsafe, data, the combination of which into a general map is a laborious and, after all, unsatisfactory essay. A partial exception to this rule is found in a survey of the Sanjak of Filihe (Philippopolis), undertaken by the direction of the provincial governor, Mehemmed-Nusret Pasha, a copy of the original of which was obtained by Dr. Kiepert at Constantinople in 1870, and a valuable translation and reduction of which map he has given along with this paper.

WE learn from the official *Gaceta de Madrid* that the Spanish Government has appointed a commission to inquire into the physical conditions and possibilities of the Philippine Islands. A Professor of Botany is to accompany the expedition to report on the nature of the flora of the interior, and on the condition and extent of the forests. A careful survey is to be taken of the entire group, and a map, drawn up on a large scale, is in consequence to be published. The mountain-ranges are to be the objects of a special investigation; the height of all the salient points is to be accurately ascertained, and all traces of metallic products to be noted. The officers in charge of the expedition are to take such notes of observation as shall enable them on their return to draw up an exhaustive monograph on the entire physical condition of the islands. It is to be expected that many branches of scientific enquiry will profit by this research in a so long neglected and most interesting region.

PARIS LETTER.

Paris: July 29, 1876.

THE recent discussion in the Senate on the subject of the conferment of degrees has called public attention to the intellectual rôle played by the Catholic party in France at the present day. I need hardly remind you that the question to be decided was whether the degrees which are the means of access to the liberal professions should continue to be conferred by the State professors of the various faculties alone, or whether, in the case of the pupils of the free Catholic universities, professors selected from these universities should be added to the State professors so as to form

mixed juries. The Chamber of Deputies, in agreement with the Minister of Public Instruction, decided for the first solution; but the Senate has maintained the mixed juries established by the so-called Law for the Liberty of the Higher Instruction of 1875. The brilliant debates to which this law has just given rise, and particularly the speeches of MM. Challemel Lacour and Jules Simon, have been the most important literary event of the month of July.

The real question at stake is not that of conferring degrees, but that of the very constitution of the Catholic universities. Frenchmen who are strangers to religious fanaticism, and are desirous to see preserved a truly vigorous and undivided national sentiment, are alarmed at the thought that a part of our young men will henceforward be separated from the rest of the nation throughout all their years of study, and brought up in ideas bitterly hostile to modern France. The Catholic party in fact tends more and more to live in isolation from the whole movement of thought, to create an intellectual and moral life apart. Allow me to profit by the respite in the publication of new books caused by the summer heats to speak of this Catholic movement.

From a political and religious point of view, the Catholics are as a rule Legitimists and Ultramontanes. The official journal of the party is the *Union*, which has always preserved in its tone and conduct something dignified and chivalrous; while the *Gazette de France* tries unsuccessfully to give itself a livelier and more liberal tinge. The *Univers* addresses itself to the lower instincts of the party, and, by the medium of M. Veuillot's biting, and on occasion eloquent, pen, makes it its business to insult and calumniate its adversaries. Legitimist in principle, it yet inclines without ceremony towards Bonapartism. The *Défense Religieuse et Sociale*, recently founded by Mgr. Dupanloup, neglects the political dissensions of the reactionary party to devote itself wholly to attacking the Republic. The *Univers* is the only one of these papers which is written with ability.

The representatives of these religious and political ideas in the professorial chair and the pulpit are not, as a rule, men of much mark. They derive their lustre wholly from the nullity of those about them. Nothing can be more turgid and declamatory than the eloquence of Father Félix and Father Monsabré. The one great orator that the Catholic Church has possessed of late years, Father Hyacinthe, was never an Ultramontane, and now has almost ceased to be a Catholic. M. Chesnelong is totally devoid of all oratorical power; Mgr. Dupanloup, who won a deserved reputation as a Liberal Catholic, seems to have utterly lost his intellectual balance since he became an Ultramontane, and among his mental qualities there is no force and no fairness left. His last publication, *Où allons-nous?* is a dull and almost drivelling pamphlet that proves nothing. There remains M. de Mun, ex-captain of cuirassiers, the apostle of the Catholic working-men's clubs, but for all his apostleship a man of the world and the idol of the ladies. He has real talent, marvellous facility of elocution and gesture, great purity of style, the warmth and accent of conviction. But beware of reading his speeches; they are mere rhetoric—clever and agreeable, it is true, but unconvincing and not always very ingenious. I am only speaking, you will understand, of the really Catholic and clerical orators and writers, of those who belong with all their heart to the Ultramontane party, not of those lukewarm folk who, like M. de Broglie or the Bonapartists, support Catholicism from motives of policy. Nor am I speaking of the purely religious and devout press and literature, which are remarkable almost solely for their utter imbecility.

But it is not through the medium of the daily press, or of its pulpit and professorial eloquence, that the Catholic party exercises its greatest influence; it is by the part which it plays in the sphere of education, literary and scientific. In

education it began by acquiring liberty of primary instruction, while with the support of the Government it kept in the hands of the teaching Orders a large proportion of the State schools. Next it obtained liberty of secondary instruction, and France is covered with colleges of Jesuits, Dominicans, Marists, &c. Finally, it has just obtained liberty of the higher education, and numerous free faculties have been founded. They are not very conspicuous as yet, either for the brilliant merit of their professors or for the number of their students, but they may make progress as time goes on. If all these schools had taken vigorously in hand the cause of educational reform, had shown themselves superior to the State establishments where routine is all in all, they might have exercised enormous influence. Unfortunately—or, fortunately, perhaps—they have servilely followed the programme and methods of the *lycées*, and have had no object but that of turning out as many engineers, officers, magistrates, doctors, devoted to their own ideas as they possibly could, and they have, in fact, succeeded in producing a very considerable number. Nor have they sent out any distinguished men in mathematics or the natural sciences, and, in fact, nothing can be more hostile to the scientific spirit than the theocratic spirit; nor have they produced a single poet. The only Catholic poet in France is M. de Laprade, who is really and truly a Pantheist, and who adores in Catholicism the sole form of paganism which has retained any semblance of vitality. As to novelists, the Catholic party again possesses but one, Mme. Augustus Craven, authoress of *Récits d'une Sœur*, a writer of delicate and subtle genius, but not to be mentioned in comparison with a real novelist—George Sand, for instance.

There is only one branch of studies in which the Catholic party distinguishes itself—namely, in works of scholarship, in those at least relating to the Middle Ages. It produces neither Orientalists, nor Greek scholars, nor Latin scholars; but it produces historians and Romance philologists. They are not, it is true, men of powerful intellect, skilled to generalise or to create. The narrowness of the ideas imposed upon them forbids them wide horizons and large thoughts; but they are good, skilful and courageous workers. Their religious and political convictions likewise induce them to take refuge in the Middle Ages, to make known all their noble aspects, to penetrate into their every phase. This is what leads a very large number of the most highly gifted among the young Catholics to study at the Ecole des Chartes; and their selection has gained the Ecole, which is really conducted in the most independent spirit, an unjust reputation for clericalism. The most important work undertaken by this Catholic school of learning is beyond dispute the *Revue des Questions Historiques*, edited by M. de Beaumont. The writers show a party bias and a passion that affect no concealment; but the *Revue* contains a great number of learned contributions, and a great store of valuable information with regard to the progress of historical studies, both in France and abroad. MM. Boutaric, de Beaumont, and Riant, are favourably known to all who study the history of the Middle Ages; and the brilliant success of this *Revue*, which has over 1,500 subscribers, is certainly well deserved. It gives the best idea of the learned activity of the Catholic party in France. Nor has its indefatigable and learned editor confined his efforts to this one creation. He has also established a bibliographical *Review*, the *Polybiblion*, a monthly periodical which keeps its readers posted up in all the new publications, French and foreign. The latter department is somewhat neglected; devotional works occupy a large space which might be much better employed; and the ultra-Catholic point of view of the contributors is even more offensive than in the *Revue des Questions Historiques*; but the *Polybiblion* is the only general bibliographical journal existing in France, and it is consequently useful and largely patronised.

M. de Beaumont is likewise the founder of a Bibliographical Society, which provides its members with a reading-club, and which also undertakes the simultaneous publication of propagandist tracts and of learned works. While the Abbé U. Chevalier is about to publish for this Society a *Dictionary of the Sources of Mediaeval History*, which will be exceedingly solid and valuable, it is scattering abroad a host of little treatises on contemporary questions handled from the standpoint of the narrowest Ultramontanism. But it still does its best to popularise in brief works based on contemporary authorities the history of mediaeval France.

In the department of Romance philology the Catholic school is represented by M. Léon Gautier, professor at the Ecole des Chartes, and author of an admirable work on the French mediaeval Epics, who has for some years past with meritorious zeal constituted himself the propagator, and, so to speak, the apostle, of the *Chanson de Roland*. M. Sepet may be mentioned beside him, but has produced no very considerable work.

M. Paul Riant has made himself a name by his profound knowledge of the history of the Crusades. He has founded a Society for the History of the Latin East, which will do good service, and which, fortunately, has no narrow religious character.

With this group of ardent and distinguished men must be mentioned the writers of the *Correspondant*, a bi-monthly Review, which made its reputation as the organ of Liberal Catholicism when that variety of Catholicism existed. But at the present day Lacordaire and Montalembert are dead, A. de Broglie, de Falloux, Dupanloup are Liberals no longer. The *Correspondant* remains a well-written Review, but it is assuming more and more that character of historical learning which is the distinguishing mark of the modern Catholic School. We should also mention the *Revue du Monde Catholique* and the *Etudes historiques de la Société de Jésus*; but these are little known and of little merit.

To sum up what I have said, passing over the practical activity of Catholicism, so powerful and in many respects still so grand, contemporary French Catholicism scarcely shows any intellectual vitality except in works of historical learning and research. This is not enough to make us fear to see it assume the control of men's minds; and if the State will but reform its higher education in a liberal sense, it will be easy for it to reduce to zero the importance of the new Catholic universities. G. MONOD.

CORRESPONDENCE.

LANGUAGE AND RACE.

Queen's College, Oxford: August 1, 1876.

I am sorry that Mr. Whitmee had not been able to see my paper on "Language and Race" before he wrote his letter about it, as he would have found that the short abstract of it to which he refers does not convey a very clear idea of what I have urged. The main point of the paper was to show that we cannot safely argue from language to race. In other words the sciences of comparative philology and ethnology do not cover the same ground. Language is a social product; its science deals with communities, not with races. Wherever community and race are equivalent terms, there and there only is language alone a test of race. In other cases it may raise a presumption in favour of the common racial origin of two populations, but unless this presumption be borne out by physiological considerations it must be discarded. Taking Mr. Whitmee's illustration, the relationship between the languages of the Maories and the Hawaiians shows that the ancestors of each once lived in close contact, either in Hawaii itself or in some other country; but before we can conclude that these ancestors belonged to the same races we must call in the assistance of ethnology. No doubt, in this particular case, as in many others, the original connexion between the communities makes it probable that there was also an original connexion of race. If physiology, however, determines otherwise comparative philology cannot be accused of running counter to its conclusions. The two sciences deal with a different subject-matter, and a different set of facts. Race precedes society, and with society language begins. It is with race that physiology and ethnology are concerned; the science of language knows nothing of man until he has become "a social animal." A. H. SAYCE.

A SWISS ACADEMY OF SCIENCES.

Campfer, Engadin: July 29, 1876.

Prof. A. F. Kym has just issued suggestions for the formation of a Swiss Academy of Sciences. In addition to its four High Schools, Switzerland possesses two Academies (Lausanne and Neuchâtel), which only need the Medical Faculty in order to take rank as complete universities. The maintenance of the High Schools is already a great strain upon the funds of the Cantons in which they are situated, and it is impossible to keep them up to the level of the German universities with such means as the Cantons can provide out of their own resources. The Canton of Zürich, with about 280,000 inhabitants, is at present spending more than 1,500,000 francs a year for educational purposes. Prof. Kym draws a sad picture of a possible future in which Zürich may be compelled to break with its proud historical past and injure itself and the whole of Eastern Switzerland by the dissolution of its university. He thinks that the University Cantons, which do so much for the whole Swiss Confederation, have a claim upon the whole. "A Confederate University, the ideal of our youth," he says, "is purely impossible under our present relations. The individual formation of our Confederacy demands individual centres of culture and education." Then there is not only the historical individuality of the Cantons, which each Canton desires to keep, but the national individuality of the *Deutsch* and the *Walsh* stocks, each justly insisting on its own importance and significance in relation to past and present culture. The only institution which can give unity to Swiss scientific progress, without interfering with the individuality and autonomy of the existing Cantonal Universities, is, contends Prof. Kym, a Confederate Swiss Academy of Sciences. He virtually proposes that the Confederation, apart from grants to the Cantonal Universities, should endow men of eminence "in the pure and productive sciences." The persons thus endowed would form the germ of the Swiss

Academy: around this germ other scientific men might be grouped, whether or not holding any sphere of work in the universities. "In the fire of science," he says, "all those differences which divide the professor extraordinary from the ordinary professor, and the professor from the tutor, should be burnt up." By "the pure and productive sciences" Prof. Kym understands the Natural Sciences in the widest range of the term Nature—Mathematics, Philology, History, and Philosophy. A theologian ought not to be admitted to the Academy as such; but he will often be admissible as a philologist or historian, or as expert in some other science. He also proposes that the philosophical faculties of the Cantonal High Schools should be supported by the powerful arm of the whole Swiss Confederacy. The whole Confederacy, as he says, has taken care that the common school shall be good and thorough throughout its jurisdiction: it cannot consistently treat the highest culture as a matter of merely cantonal concern. Through some such centralisation of science, and support and recognition of its study as an affair of national importance, he thinks it probable that many a Switzer who now devotes fine faculties to trade, might turn them into the road of science; probably, too, many a rich and noble-minded citizen who remembers the sick in his last testament might be mindful of the help which is needed by the sound intelligence of the land. I have given a very slight summary of Prof. Kym's detailed suggestions, which are set forth with great zeal and glow. He naturally enough thinks that Switzerland has, from its political and race-conditions, a peculiar call to become an intellectual nation. He dwells upon the happy situation of Geneva as fitting it to be the seat of the freest science. T. HANCOCK.

SCIENCE.

The Octopus, or the "Devil-Fish" of Fiction and of Fact. By Henry Lee, F.L.S., F.G.S., F.Z.S., &c. (London: Chapman & Hall, 1875.)

EXCEPT to a few naturalists and the yet rarer students of Pontoppidan and De Montfort, the octopus was almost unknown until Victor Hugo drew attention to it a few years ago in the pages of *Les Travailleurs de la Mer*. It is true that centuries ago Aristotle had minutely described the life and habits of the monster, but his *History of Animals* is not a college text-book, nor have its contents been regarded in past times without suspicion. In this particular instance it was thought that fishermen had imposed upon the credulity of the philosopher as travellers had upon that of the Father of History, and it is only in very recent days that the accuracy both of Aristotle and Herodotus has been largely established. Mr. Lee, the latest and the pleasantest writer upon the subject, goes so far as to say that the Stagirite's account of the habits and reproduction of the octopus "clearly show that he was more intimately acquainted with its mode of life than any writer of later date between his day and ours."

In England the popularity, if we may so call it, of the octopus is almost wholly due to M. Hugo's romance. The public flocked to the Brighton Aquarium to see the devil-fish with whom Gilliatt, like a second Perseus, had engaged in deadly combat, and in whose den he had discovered the human skeleton with its hoard of wealth. Perhaps a little disappointment was felt when the

captured specimen was found to fall short of the novelist's sensational description, but there was an air of mystery about its habits which kept alive the curiosity of the public during its brief sojourn in the tank. Its end was ignoble. It was devoured by a common dog-fish, whose powers and propensities had escaped suspicion. But its place was speedily supplied by another specimen, and during the last three years there have been abundant opportunities for examining the construction and habits of this remarkable creature, and, we may add, for correcting the errors into which M. Hugo had fallen.

The octopus is a distinguished member of the *Cephalopoda*, and nearly related both to the Argonaut, or "Paper Nautilus," and the common squids and cuttles. Its chief characteristic is the possession of eight arms, or prehensile organs, furnished with numerous sucking discs, by means of which it is enabled to adhere firmly to any substance with which they come in contact. The usual habit of the animal is to rest suspended from a rock by the suckers of several of its arms, and, while its body is concealed in some cranny or recess, to allow the rest of its feelers to float loosely in the surrounding water. The instant a fish, crustacean or mollusc, touches any of these arms, the suckers are drawn inwards, the air exhausted, and the victim secured by a pneumatic process which is almost irresistible in power.

It will be evident, therefore, that if the octopus attained to any great size it would be as formidable to an unarmed man as to any other creature that chanced to come within its grasp. And there are many well-authenticated instances of men having been dragged under water and drowned by devil-fishes of unusual size. It is small consolation to be told that the octopus does not seize a man for the purpose of devouring him, or even of converting his dead body into bait for crabs, which are the animal's favourite food. It only follows its instinct in laying hold on anything moving that comes within its reach, and in clinging to it with a persistency which is more than embarrassing. It is well to know that it can be made to relax its grasp if it be seized tightly by what looks like its throat, and that, if left to itself, it is much more likely to decline than to provoke a contest.

In the Mediterranean and on the coasts of Newfoundland the octopus sometimes attains a body-length of six or seven feet, with tentacles from twenty to forty feet long; and two years ago one was discovered by some fishermen near Boffin Island, Connemara, the arms of which measured ten feet, and the tentacles thirty feet—if the report be genuine.

But, happily for nervous bathers, these dimensions are never attained on the coast of England, and visitors to Brighton are not likely to meet with a specimen outside the walls of the Aquarium. Mr. Lee, indeed, found one at the table of a distinguished neighbour, and was politely pressed to partake of the delicacy; but his recorded experience is not such as to induce fishmongers to submit the octopus to the approval of "a discerning public." Yet there can be

no doubt that the creature, however unappetising in appearance, is sufficiently palatable when well-cooked, and that it is highly appreciated in many parts of Europe, and especially on the coasts of South America.

Mr. Lee's monograph is agreeably written, full of gossip and good stories, and his chapter upon the reproduction of the octopus is a valuable contribution to Natural History.

CHARLES J. ROBINSON.

Nouvelle Grammaire Française, fondée sur l'histoire de la langue, à l'usage des établissements d'instruction secondaire. Par Auguste Brachet. (Paris: Hachette et C^e, 1874.)

M. BRACHET is well known as the author of (among other books) a *Historical Grammar* and an *Etymological Dictionary* of his own language, both of which are very popular, and have been translated into English; in the present work he aims, with the advantage of experience, at utilising the history of French for the practical teaching of its modern grammar. As he well remarks, though it is worse than absurd to suppose that a child may be allowed to rely on its understanding and dispense with memory, the historical explanation of grammatical facts and rules is valuable not only as a means of cultivating the understanding, but as an aid to memory; provided, as he adds, that children are taught only those results of linguistic science which are well-assured, and that erroneous or doubtful philological notions are strictly proscribed. M. Brachet further states that he has tried to simplify the syntax, chiefly by freeing it from the puerilities of the schoolmen, and to render the study generally more practical by exhibiting the formation of words.

This programme, though now familiar to most English grammarians, is new in France, and so good as to make us greatly regret its being carried out in such a way as to more than neutralise many of its beneficial effects; the book often teaches neither good philology nor good French. Before we have got through the historical introduction we find the following statements: that the loss of the Latin inflections is due to the inability of the Barbarians (why does M. Brachet always use this term, sure to give children a false idea?) to distinguish their sounds; that the phonetic changes from Latin to Old French are Gaulish mispronunciations of Latin; that in Caesar's time two distinct languages were used at Rome, one by the educated, the other by the uneducated; that the former, Classical Latin, was created by the lettered class; and that the Romanic languages are not derived from Classical Latin. That each of these theories is anything but established, every philologist knows, and we are far from being the first to maintain that they contain only enough truth to make them dangerous; to present them dogmatically is an odd way of proscribing dubious philological notions.

The definitions prefixed to the first book, and its title, "Study of Letters," prepare us for the confusion between phonology and orthography which reigns in it. Not throughout: after telling us that words are composed of letters, M. Brachet says

they are composed of sounds, which are represented in writing by signs called letters; and then come some excellent remarks on the badness of French orthography. But, as a whole, the section is a generation behind the age, and a signal example of the effect of putting new cloth into old garments. The account of Modern French sounds is extremely imperfect, some being omitted, and others ludicrously misdescribed (it is said that *ch=sh* and *j=zh* are produced by the throat!); that of the orthography is very incomplete; and the historical information is not unfrequently wrong or deficient. For instance (here, as elsewhere, we give only specimens, for to point out all the errors and omissions would swell our review into an essay), in the paragraph on *x* only two of its values—*ks* and *gz*—are mentioned, the four others (two of them much commoner)—*k*, *s*, *z*, and nothing at all—being omitted; its sounding *ks* or *gz* is given as the reason why *heureux* &c. (does M. Brachet say *derûks*?) do not take *s* in the plural; the orthographical fact that *x* is now used in finals where Old French has *s* or *z* (= *ts*), and the phonological fact that the sounds these represent derive from Latin *s* or *k* (*c*), are given as a purely phonological fact of the derivation of French *x*, with its imaginary guttural, from Latin *x* or *c*; while the general loss of final *s* in Modern French, and the frequent case of *x* being written in terminations where Latin had *s* (as in *heureux* itself), are unnoticed. M. Brachet apparently does not suspect that this first book comprises at least ten distinct, though related, enquiries: (1) what sounds now exist in French; (2) what signs (letters, accents, &c.) are in customary use; (3) the origin of the sounds; (4) the origin of the signs; (5) what signs are used to represent each sound; (6) what sounds each sign, or group of signs, represents; (7) the rules for practically applying No. 5; (8) the same for No. 6; (9) the historical reasons for No. 7; (10) the same for No. 8. If a subject is to be properly learnt, still more if its study is to train the mind, the importance of so presenting its elements that they may be thoroughly grasped can hardly be too strongly insisted on; and the confusion existing in the very foundations of M. Brachet's exposition is the more deplorable, as, if grammar is of any use beyond showing how to avoid solecisms of spelling and speech, it is in promoting clearness of thought by analysing, and teaching how to use well, its chief instrument.

It may be urged that to do this first book properly would have required, though enough of the facts are well known, more original thought than M. Brachet professes to give. But this cannot apply to the numerous mistakes and reckless assertions in the historical linguistic paragraphs of the treatise, where M. Brachet had only to follow standard works. Under Latin *o*, its frequent French change to *u* (written *ou*) is omitted; so is the very common derivation of French *z* (soft *s*) from Latin medial *s*, of *v* from medial *v*, of *k* (*c*) from initial *k* (*c*). It is stated that Latin *ā* gives French *à*, L. *ā* F. *é*; each really gives both. Old French words are often incorrectly given, as *châtel* for *chastel*,

ouis for *oi* (L. *audio*), *soi* for *soie* (now *sois*). Of false explanations where the true are familiar, we may select the making *y* in *croyant*, *écuyer*, a sound inserted to prevent hiatus; much of the history of the terminations of the imperfect; and the almost incredible derivation of *moi*, *toi*, *soi* from *mī*, *tibi*, *sibi*, though elsewhere M. Brachet himself gives the correct *mē*, *tē*, *sē*. The *is* of *finis* (1st sing. pres. ind., Latin *-isc-o*) is represented as a purely personal termination, while the corresponding *iss* of the plural *finissons* is rightly separated from the *ons*; and more than once the *e* of *aime* is given as the descendant of the *o* of *amo*, whereas the O.-Fr. form is *aim*, *aime* being a comparatively recent analogical form. In other explanations of verbal inflections M. Brachet ignores patent cases of analogy; he says of the irregular perfects that they are all explained by the corresponding Latin forms, forgetting to compare *courus* with *cucurri*, *nuisis* with *nocui*. We should like to know the authority for the assertions that close *e* was unknown to the Romans, that *ti* (at the period of Latin usually studied in schools) was pronounced *ts*, and that Latin *s* was generally soft, as in *salutem* (*sal-*); the last assertion is so astounding as to make us think that M. Brachet's notion and ours of what constitutes a well-established linguistic fact are essentially different. And to speak of certain Old French final letters as "originally naturally silent," shows that he does not realise the important fact that at the beginning, and in the main for centuries after, Old French orthography was phonetic. So far as it was not, and indeed so far as the value of the letters had altered, the phonetic and inflectional comparison of Latin and Old French words in their customary spelling is delusive: a remark specially applicable to M. Brachet's (and the usual) mode of discussing modern French, whereby such a form as *rō*, before vowels generally *rōi*, is given as *rompt*, and compared with *rumpit* as if the only changes were that of *u* into *o* and the loss of *i*—without a hint that all the Latin *m* has vanished except its nasality, that the *p* is totally lost, and that the *t* is but rarely preserved.

Some of the faults of the second book, the "Study of Words," have already been noticed; and we are not about to reproach M. Brachet for having retained the marvellous system of cross-division—partly formal, partly etymological, partly functional, partly signification—which is embodied in the ten parts of speech, nor even for giving us definitions of these and their subdivisions which do not define them. But we had a right to expect that this part would be as full and accurate as in an ordinary grammar; that we should not seek in vain for the feminine adjectives *grecque*, *tierce*, &c., nor be told by rule and examples that the contraction of *de les*, *à les*, to *des*, *aux*, takes place only before masculine nouns beginning with a consonant or aspirated *h*, and that the personal pronoun (not the possessive) *leur* is of the singular number. To judge by M. Brachet's rules, it would be as absurd to apply to a single person *vous chantez* as *ils chantent*; and his statements that the simple tenses mark an action not finished at the time spoken of, and that the preterite, as in *je chantai hier*,

marks an action at a time completely past, hardly agree. The definition of the use of the subjunctive to express that an action depends on another action, and the example, *je veux que tu viennes*, also strike us as discordant; we have not always found other people's actions to depend on our wishes. And what a clumsy and inexact way of stating the simple facts that in course of time *grand*, &c., followed the analogy of the more numerous adjectives whose feminine was in *e*, and that *grande* was written because *grānda*, not *grānt*, was said, is this!—

"The fourteenth [?] twelfth] century, ceasing to understand the reason of this distinction, thought it saw an irregularity in the fact that *grand* made its feminine without *e*, *bon* with; it then gave all these adjectives *e* in the feminine, and wrote *grande*."

Did any earlier century—that is, did the people who then spoke French—understand the reason? or did the fourteenth think about the matter at all?

M. Brachet's *Syntax*, as its shortness makes one expect, is simplified by some of the rules being left out and others wrongly given. It is easy to ridicule "scholastic puerilities," "imperceptible distinctions," "Byzantine subtleties," and "metaphysical apparatus," for logicians and metaphysicians often make wretched grammarians; but it happens that many of these things are founded on fact, and to simplify grammar by ignoring its difficulties is only to encourage looseness of thought and expression. And, on the practical side, it is disappointing when in a doubtful case one consults a grammar, to receive no information but that the correct expression is to be learnt from practice. The rules for the replacement of the possessive pronoun by the personal one with the article, and those for the employment of the subjunctive, are specimens of the inaccuracies gratuitously introduced by M. Brachet: an attempt to follow this one, "Verbs of denying, doubting, supposing, and believing take the indicative when the denial, doubt, or belief is absolutely affirmed; in other cases the subjunctive," causes us to say *nous nions qu'elle est correcte*, while the affirmation of doubt in M. Brachet's example to the second half of his rule, *je doute qu'il fasse beau ce soir*, is as clearly absolute as the example's consequent contradiction of the first half. The reason given for the invariability of the participle in *il a acheté une ferme*—that this stands for *il a acheté cela, une ferme*—is worthy of a grammarian of the prehistorical period; but in general M. Brachet has not attempted to give reasons for his syntactical rules, which are as little explained as those of his predecessors, besides being often much less complete, clear, and correct. In almost every respect this portion of the work is so unsatisfactory as to raise the wish that M. Brachet had studied the subject before attempting the improvement—for which there was plenty of room—of its treatment; it is far behind the English, Latin, and Greek *syntax* of several English schoolbooks, and on the whole compares very unfavourably with that of ordinary French grammars. The appendix on Analysis is extremely meagre, and based on a familiar, but very shallow, division of our knowledge of things

in general, and words in particular, according to nature, form, and function. The application of the theory is in keeping; the formation of the feminine *princesse* from *prince* is stuck in under "nature," that of *nouvelle* from *nouveau* (-*el*) under "form"—with about equal appropriateness.

After this monotonous fault-finding, it is a pleasure to point out that in some respects M. Brachet's work is in execution, as well as intention, a highly important advance on previous school grammars of French. Some of the rules and explanations are excellently put; the account of the formation of words is a most valuable addition, generally well done; the distinction drawn between words of popular, of literary, and of foreign origin is essential for phonology; and the division of the conjugations into living (-*er* from substantives, -*ir*, participle -*issant*, from adjectives) and dead (-*re*, -*oir*, and -*ir*, participle -*ant*) is admirably adapted to display the resources and continual growth of the language. But the work, as a whole, though its philology is often better than that of M. Brachet's *Grammaire Historique*, is most disappointing, and we should be sorry to compromise the excellent idea on which it is based by recommending its adoption in place of Noël et Chapsal and other guides of our childhood; most teachers and many learners will detect some of its linguistic blunders, unfortunately while accepting others, and use is sure to bring out its grave practical shortcomings. However, the good parts show that M. Brachet is far from having done his best elsewhere; and if he will bring to his by no means easy task sounder knowledge and more reflection, get rid of the superficiality which accepts neat and striking phrases as a substitute for clearness of thought and accuracy of fact, and, above all, abandon the slovenly and hasty mode of work which has left hardly a chapter free from numerous, sometimes gross, mistakes (there are even far too many misprints for a second edition, as our copy is marked), he will yet produce a historical school-grammar worthy of French philology, and with which his name will be honourably associated.

HENRY NICOL.

SCIENCE NOTES.

METEOROLOGY.

Meteorology of Japan.—The latest publication of the Meteorological Office is from the pen of Staff-Commander Tizard of the *Challenger*, who when he was in Japan induced the authorities to allow him to copy their Lighthouse Registers, and has discussed them, presenting their results in the form of charts. As an appendix the Meteorological Office has inserted the means of the various meteorological elements for the district which had been extracted from the logs in the office under the superintendence of Admiral FitzRoy. The whole forms a useful contribution to our knowledge of the meteorology of the China Seas.

Meteorology of South Australia.—Mr. Charles Todd, who seems to embody in his own person much of the scientific knowledge of the colony, being Postmaster-General, Superintendent of Telegraphs, and Government Astronomer, has just issued a reprint from the *Handbook for South Australia*, consisting of a careful discussion of the meteorology of the country. We cannot but say that the value of Mr. Todd's Greenwich training comes out in the thoroughness with which he has

organised the observatory at Adelaide in regard of the means at his disposal. The records dealt with in the paper stretch back for nearly forty years; rainfall observations having been commenced by Sir G. S. Kingston, the present Speaker of the House of Assembly, in 1839. As might be anticipated in a new colony, with a sub-tropical climate and pursuits mainly pastoral, the main burthen of the report is the questions of rainfall and evaporation, as being those which most immediately affect the most important interests.

Meteorology of Pesaro.—Prof. Luis Guidi has commenced with the current year the issue of a series of monthly sheets similar to those which formerly appeared in the *Meteorologia Italiana*, showing for his observatory the march of the various elements of meteorology and terrestrial magnetism. He complains of the delay in the issue of the *Bullettino Decadico*, and consequently announces his intention of issuing these graphical results for his own station, so as to ensure their appearance at an earlier date.

Meteorology of Denmark.—Capt. Hoffmeyer has just published Part I. of his *Aarbog* for 1875, containing the results for the stations situated in Denmark itself, with three charts showing the positions of his stations for general observations, for rain and for wind, respectively. The detailed observations, on the international form, are given for eight stations for three observations daily, and the records for Vandrup are discussed from bihourly observations. The report also contains some valuable information on the weather of the year 1875, on the climatology of the kingdom, and on the distribution of rain and wind.

Agricultural Meteorology in France.—M. Le Verrier has given in the *Bulletin* of the Association Scientifique for May 21 and July 9 an account of the plan he has devised for the issue of weather-warnings from the Paris Observatory to the various departments of France. The broad features of the plan are as follows:—Departmental commissions are to be nominated by the *Préfets*, some members of which are to be specially charged with the duty of receiving the telegrams, and applying the information to the best advantage for the district. Public barometers are to be provided and erected. The telegrams will convey to the district the information required to draw large weather-charts, and curves of the march of the most important phenomena. The chief points to which attention will be in the first instance directed will be the advance of rain over the country, and the motion of thunderstorms and hail-storms. We can only hope that M. Le Verrier will be fortunate enough to secure capable and continued co-operation on the part of the Departmental Commissions. If the heavy responsibility which must necessarily fall on them be intelligently discharged we may hope for great results from this bold venture in practical meteorology.

The Storm of March 12.—M. Ernest Quetelet has laid before the Academy of Brussels a brief account of this storm, which was so remarkable in its behaviour in this country, while in Belgium its fury exceeded anything which had been experienced since the establishment of the observatory. In such a small country as Belgium it is naturally impossible to attempt to follow the march of the phenomenon.

Monthly Weather Summaries for Western Europe.—The last number of the *Annalen der Hydrographie*, which are published monthly in Berlin, contains the first instalment of a projected account of the weather of North-west Europe, in the shape of a summary of the weather for March. The paper has been prepared by Dr. Wladimir Köppen, who left his situation at St. Petersburg more than a year ago to take the superintendence of the newly-organised *Deutsche Seewarte* at Hamburg, as regards its weather telegraphy. At the same time M. Harold Tarry, formerly secretary of the Société Météorologique in Paris

has commenced in *Les Mondes* a similar serial discussion, which, however, extends further to the southward (embracing Algeria) than it is possible for the German discussion to reach. Moreover, this paper is apparently to be illustrated regularly by monthly charts of storm-tracks. We may well wish every success to both these spirited and useful undertakings.

Contributions to the Meteorology of the United States.—Prof. Loomis, whose former papers have frequently been noticed in our columns, has published in Silliman's *Journal* for July the fifth part of his "Results from an Examination of the United States Signal Service Observations." This paper is even more fragmentary than its predecessors, and the most important section of it is a discussion of the severe cold of December, 1872, with some remarks on the formation of areas of high pressure and low temperature in connexion with the resistance of districts of low barometrical readings. He finds that the former are principally generated on the south-east side of an area of depression; for the United States he gives the distance between the two centres as about 1,200 miles, and the bearing of the cold area from the warm one a little south of east. The paper concludes with a discussion of the paths and rates of motion of West India hurricanes, and it is not a little tantalising to find that all the reasoning and conclusions are deferred to a later communication.

The Diatheroscope.—Prof. Luvini, of Turin, has sent to the Scientific Exhibition at South Kensington an instrument of a totally novel principle for measuring atmospheric refraction. Its construction is as follows. If we cover half of a lens the image produced by it will only differ in brightness from that formed by the uncovered lens. Moreover, if we take two lenses of equal focal length, and place them at a distance from each other equal to the sum of their focal lengths, the rays emerging from the second will have the same degree of convergence as those entering the first—i.e., the object looked at will appear in its natural size and position. Any agency—such as irregular refraction of the atmosphere—which alters the path of the light from the object to the system of lenses will alter the position of the image formed. If now we have a telescope of such a size that the lenses of the diatheroscope cover half the aperture of its object-glass, we can form two images of the distant object, one as shown *through* the diatheroscope, the other as shown *beside* it; this latter image will be formed by the rays coming directly from the object to the telescope. If the telescope is astronomical, the latter image will be reversed, while that transmitted through the diatheroscope will be in its natural position. The distance between these two images will depend on the refraction of the atmosphere, and so the instrument may be used to measure that refraction. Prof. Luvini proposes that four of his instruments should be placed at each observatory, directed to the four cardinal points, and that, by their means, observations should be taken at regular intervals of the condition of atmospherical refraction all round the observatory; he thinks that by this method information of coming changes of weather can be obtained earlier than by the means now at the disposal of meteorologists. The original papers are in the *Atti dell' Acad. delle Scienze di Torino*, 1873-4.

A New Hygrometer.—Prof. Klinkerfues, of Göttingen, has sent to the Exhibition several specimens of his new hygrometer, in which he applies the principle of bifilar suspension employed by Gauss for the measurement of magnetic intensity. The instrument is described in a special pamphlet, *Theory of the Bifilar Hygrometer with Equal Divisions*, published by Peppmüller, in Göttingen. The means of suspension are human hairs, and the instrument is said to give not only the dew-point but the relative humidity. If the arrangement proves to be satisfactory it will be a great boon to observers.

The Origin of the Gulf Stream.—It is rarely that we have to notice anything coming from Brazil, but Lieutenant da Graça, of the Brazilian Navy, has lately published a pamphlet with his ideas as to the causes of the Gulf Stream, which differ as widely from those of Mr. Croll as from those of Dr. Carpenter, not to mention Captain Digby Murray, of the Board of Trade, the latest aspirant to the honour of breaking a lance in the long-fought field. Señor da Graça goes to the root of the matter by boldly asserting that the heat of the water is derived from submarine thermal springs; but, as he has no soundings to prove his facts, we may safely leave him to the tender mercies of the disputants we have named.

GEOLOGY.

STUDENTS of Vertebrate Palaeontology will welcome the appearance of Prof. Owen's fine quarto Catalogue describing the British Museum Collection of Fossil Reptilia from South Africa. It was in 1838 that fossils of this kind were first found in Cape Colony by Mr. A. G. Bain, the discoverer of *Dicynodon*, and so singular were the modifications of reptilian structure which they exhibited that the discovery of additional specimens has always been matter of interest. Year by year the British Museum has been growing richer in these fossils by donations from various sources, especially from Dr. Atherstone; while the study of their structure and affinities must be reckoned among the most fruitful of Prof. Owen's palaeontological labours. In the present catalogue the specimens are carefully described, with copious explanatory remarks, and the descriptions illustrated by seventy lithographic plates, admirably executed by Mr. C. L. Griesbach, who has himself travelled as a geologist in South Africa. It is evident from the nature and mode of occurrence of the fossils that the reptiles here figured must have lived near a vast body of fresh-water which occupied an extensive tract now raised into mountain ranges of considerable altitude, such as that of the Drakensberg, upwards of eleven thousand feet high. Moreover the chief lake-basins must have existed for vast periods, as testified by the great thickness of the lacustrine deposits in which the fossils are embedded; thus the Stormberg beds are not less than eighteen hundred feet in thickness. Yet throughout these strata there has never been found a single cycad or other plant characteristic of Jurassic rocks; and the lacustrine beds, with their enclosed reptilian remains, are, therefore, probably of Triassic, certainly of pre-Liassic age. Prof. Owen's noble catalogue places within the student's reach great facilities for studying this interesting group of organic remains.

It has long been known to Indian geologists that there exists in the province of Sind a fine series of Tertiary deposits, and, indeed, the nummulitic fossils figured by MM. d'Archiac and Haime were mostly obtained from the rocks of this province. Mr. W. T. Blanford, with Mr. Fedden, has defined the succession of beds, and made out the following classification in descending order: the *Manchar*, or Sevalik beds, of Pliocene age; the *Gij*, or supra-nummulitic rocks, of the Miocene period; the *Nari*, or upper nummulitic deposits, either Lower Miocene or Upper Eocene; the *Kharhar*, or lower nummulitic deposits, of Eocene date; and the *Ranikot*, or infra-nummulitic rocks. The new names are all taken from well-known localities in Sind. Mr. Blanford's memoir will be found in the last part of the *Records of the Geological Survey of India*.

THE last contribution to the *Memoirs of the Indian Survey* is a valuable report by Mr. A. B. Wynne on the "Trans-Indus Salt Region in the Kohat District." The rock-salt is among the largest exposed deposits of this mineral in the world, and some of the workings are known to date back as far as 1650, while others appear to

have been wrought from time immemorial. In geological age the salt is probably contemporaneous with the basal part of the Subathu nummulitic series. An excellent geological map, chromo-lithographed, accompanies Mr. Wynne's report, to which is also appended an essay on the economic application of this salt region, contributed by Dr. Warth.

WHILE referring to the Geological Survey of India we may remark that Dr. Oldham is at present in this country, having, we believe, resigned the directorship. It is rumoured that he will probably be succeeded by Mr. Medlicott.

In the last *Bulletin* issued by the United States Survey of the Western Territories a notable feature is introduced in the shape of pictorial sections, which have the double advantage of imparting geological information while they present a panoramic view of the scenery along some of the more important rivers. Dr. Hayden contributes some notes accompanying the sections and describing the structure of certain parts of Montana. This *Bulletin* also includes a valuable hypsometric map of the United States. The contour-curves are drawn approximately at intervals of a thousand feet, and strikingly show the physical features of the States, especially in the west. A descriptive note, by Mr. Gannett, accompanies the map. We should like to see such a contoured map of the States produced on a much larger scale.

UNDER the title of *Lethaea Palaeozoica* an atlas containing sixty-two plates of characteristic palaeozoic fossils has just been published by Prof. F. Roemer, of Breslau. The plates will be accompanied by a volume of text, but this will probably not be ready until next spring. The atlas may be regarded as the first part of a new edition—the fourth—of Bronn's well-known *Lethaea Geognostica*. The lithographs are admirably executed, and remind us of Mr. Bailly's *Figures of Characteristic Fossils*, but the work is on a larger scale and extends to Continental species, though a large proportion of the figures are taken from British sources. Even without the letter-press the figures will be valuable to the palaeontological student, who may turn to them with the assurance that they have been judiciously selected as representing typical specimens, and that the characters of the originals are here faithfully rendered.

ATTENTION has been lately directed to the Adalbert shaft of the silver-lead mines at Příbram, in Bohemia, which in the course of last year attained to the extraordinary depth of one thousand metres. The foot-wall of the Adalbert lode is associated with "greenstone" rocks, which have been carefully studied by Herr K. Vrba of Vienna. He shows that these rocks are diabase, and recognises two varieties: the one a fine-grained rock which is a *quartz-diabase*, and the other a compact aphanitic variety described as a *quartz-diabase-aphanite*.

A COLLECTION of specimens of Vesuvian lavas presented by the University of Naples to Trinity College, Dublin, has formed the subject of an elaborate memoir by Professors Haughton and Hull, published in the *Transactions of the Royal Irish Academy*. The specimens represent successive lava-flows from 1631 to 1868, and as they were collected by Prof. Guiscardi, of Naples, there can be no question about their authenticity. The specimens were analysed by Mr. W. Early, and microscopically examined by Prof. Hull; and from their data Prof. Haughton has calculated the respective proportions of mineral-constituents in the lavas.

It is now ten years since the late Colonel George Greenwood published the second edition of his *Rain and Rivers* (Longmans). Up to the time of his death, last November, he continued to collect materials for the development of this work, and with these materials the third edition has

been recently issued by his nephew, Mr. C. W. Greenwood. The volume is thicker than the last by about ten pages, and includes additional facts and arguments tending to strengthen the author's well-known views on sub-aërial denudation. Thus in explaining the formation of the Parallel Roads of Glen Roy, he refers to the terraces of the Fraser River, as described by Lord Milton and Dr. Cheadle. While most of the additional matter has been judiciously introduced, we cannot help thinking that some of the new paragraphs might have been advantageously suppressed; such, for example, as the unqualified assertion on p. 221 that "some of these days we shall be startled by the imprint of 'Man Friday's' foot in Cambrian sandstone."

FINE ART.

Marsden's Numismata Orientalia. A New Edition. Part II. Coins of the Urtukî Turkumâns, by Stanley Lane Poole. (London: Trübner & Co., 1876.)

THE spread of an interest in Oriental numismatics, of which the above work—itsself only part of a greater work—is a proof, is a very pleasing fact to the numismatic and antiquarian mind. The series of Greece and Rome have for two centuries been the objects of the careful investigation of antiquaries; the coinages of the Middle Ages and of modern times in Europe have of later years been diligently collected and described. Now and then a new coin may be discovered, an English John may make its appearance, or a series hitherto mixed up may be disentangled, affording the chance of enriching the English series with a Richard I., though not in his own name; and in the Continental series the like takes place. But, as a rule, the old paths are well trodden; and collectors at home and abroad, yearning for the excitement of novelty, have been compelled to devote themselves to tradesmen's tokens, guild marks, jetons, toll-tickets, and the like poor relations of the great numismatic series of the West; glad, if after long searches, a trace of a possible Perkin Warbeck may be found on a jeton of Tournai.

Meanwhile, Oriental matters are too little cared for among us. Germany, which does not possess a foot of land outside the Vaterland, counts its Oriental scholars by dozens, while England, whose sons hold India for her crown, is too often compelled to procure the services of foreigners to do in her colleges in England and India the work which Englishmen by their position in the world ought to do. And not only are Eastern history and languages neglected, but as a consequence Oriental numismatics—so valuable a handmaid of Oriental history—is neglected also.

The points of necessary contact of Christian and Muhammedan numismatics to the historical collector are not few. The early chalifs imitate the coins of Constantinople; the coins of Cordova are imitated by the Christian kings of Spain; our own Offa's name is found on a Cufic gold coin; the Christian princes of Southern Italy copy the coins of the princes of Africa; the Muhammedan princes of Asia Minor those of the kings of Naples; the grand dukes of Moscow acknowledge the supremacy of the Khans of the Golden Hords by placing their names on their coins; and it is only lately that the

coinages of the Mogul emperors have ceased to be continued by their English successor. The doings of Omar, Saladin, Muhammed of Ghazni, Muhammed II. of Constantinople; the splendours of Harûn, Abderrahman III. and Akbar; the architectural taste of the kings of Granada; the adventures of Baber, Nadir Shah, and Abd-el-Kader; the ferocity of Tip-poo Sahib—all give an interest to their coins which will be felt by the student of history, who is set above all merely local and national feeling. The pleasure which we experience in beholding the very things that attach themselves to great historic names and events, the recovery of Nineveh, Troy, Olympia, Pompeii, belongs also to the study of coins; for of these we know that some must be, and any may be, almost personal relics of the sovereigns whose names they bear.

How near, then, are we brought by these little, but indestructible, monuments to the leaders in that Eastern world, once so great and splendid, now so decayed and crumbling! Out of the great number of brilliant and powerful dynasties which ruled over the peoples of Asia, Africa, and Europe, there remain now but Morocco, Turkey, and Persia, with a few insignificant names besides. One by one they fell a prey to younger and less enervated races, and those that still linger seem likely soon to leave only their names behind for the study of historians. Would it not be well for the coin-collector in search of novelty and interest to undertake the study of numismatic monuments derived from the dynasties of Damascus, Cordova, Bagdad, Ispahan, and Dehli, and the other smaller and more evanescent ones of other places, where he still has the chance of discovering a prince, or even perchance a dynasty, hitherto unknown to numismatics? It is true that all Oriental princes are not of the highest historic fame; but who knows much of the many princes of Europe, whose coins are yet much sought after, and at high prices? The Visigoth kings of Spain, the early kings of France, the kings of the Heptarchy, are names and dates, and little more.

The horror which true Muhammedans feel at representations of the human frame makes them restrict the ornamentation of their coins, as a rule, to such as can be caused by the artistic arrangement of inscriptions; but many coins of our early monarchs and those of the French series only bear inscriptions; and when we find the sovereign's head on a Mercian or Merovingian coin, it will scarcely compare, even in the eyes of its possessor, with the portrait of a Seleucidan monarch or the head on a Syracusan medallion.

The real difficulty in the pursuit of Oriental coins is the language. That, however, can be, to a very great extent, overcome by the help of the *Lettres sur les Eléments de la Numismatique musulmane* of M. F. Soret; the religious texts so frequently recurring as types are soon recognised, and the historical part of the inscriptions may in consequence be easily disentangled from the remainder.

Mr. S. L. Poole, whose labours in Oriental numismatics are already so well known and appreciated, has with his usual care and

conscientiousness described the coins of the Ortokite princes of Syria and Mesopotamia. With the national collection and that of the late Colonel Guthrie easily accessible, he has been able to work out this peculiar series with great fullness and exactness. In his introduction he traces the history of the 200 years during which the descendants of Urtuk bore sway. The most interesting part is the share taken by the princes of this dynasty in the warfare waged by the Crescent against the Cross between the first and the second crusades. As usual in Oriental dynasties, the first one or two members of this family are conspicuous by their talents and their deeds; after their brilliant exploits for twenty years their successors for the remainder of the duration of the dynasty furnish the historian only with matter of more local interest; we hear of family quarrels, and at last the Ayubite sovereigns of Egypt and Syria annexed what remained of their dominions.

This series is the more interesting from the very curious mixture of pictorial types which are made to figure upon it. Few are the Muhammedan dynasties and sovereigns who dared in opposition to the popular ideas to ornament their coins with images. The Seljûk dynasty has the most artistic of all these representations—namely, the Lion and the Sun, adopted by the Shah of Persia as the badge of his order. This is in very fair work, and contrasts very favourably with the contemporary coins of Henry III. of England. The Atâbeys of Irak adorned their coins with portraits and figures, but the Ortokite dynasty seems to have taken a delight in putting on their coins representations of a most heterogeneous character. Any chance coin of earlier date was used to furnish an obverse. Portraits of Seleucidan and Sassanian kings, and of early Roman emperors, portraits and types of Christian Rome, together with many peculiar types from unascertained sources, combine to give to this series a fantastic appearance, which is a relief to the monotony of the pure Muhammedan types.

The great beauty of the autotype plates of this work almost relieves the student from the necessity of studying the coins themselves. The two other plates are not Marsden's, but only copies of the coins on Marsden's plates which belong to this dynasty, seven having been omitted out of twenty-seven. Marsden's plates were copper-plate; the new ones are lithographed. Although good copies, they are painfully inferior to the autotype plates. In these latter Mr. Poole has given representations of fine coins, of which only bad specimens are given in Marsden. It is to be regretted, since Marsden's text and Marsden's name have disappeared, that his plates have not also been wholly abandoned; and the more so as all the coins worth figuring in the lithographs exist at the British Museum, and so could also have been autotyped. Could not this be remedied even now, in order that Mr. Poole's good and careful work may not be marred by this mixture of good and bad plates? W. G. SEARLE.

ART TREASURES COLLECTION OF NORTH WALES
AND THE BORDER COUNTIES AT
WREXHAM, 1876.

FROM its convenience of access to the wealthiest counties of North Wales, and those which share with their border the boast of the oldest families and ancestral houses, reason would that Wrexham should succeed in furnishing for any local loan collection an exceptionally rich array of art-treasures. A faint notion of this might have been formed from the extemporised Museum of the Cambrian Archaeological Society at Wrexham in 1874; but the merit of the conception and execution of the present far completer design belongs entirely to Major Cornwallis West, the Lord Lieutenant of Denbighshire, and his able, experienced, and obliging colleague, Mr. Chaffers. To be ignorant of the latter would be to ignore the Kensington Museum, as well as to betray an ignorance of ceramic art to which few in this day would have the courage to plead guilty. On Saturday, July 22, a handsome building, on solid foundations and with a superstructure partly of wood, partly of corrugated iron, was inaugurated at Wrexham in due form by the Duke of Westminster, after an address by Major Cornwallis West on behalf of the Executive Committee, and before a supplementary concert of vocal and instrumental music. Space forbids our dilating on this programme, except to commend the helpful, matter-of-fact address in which Major West set forth the *raison d'être* of the undertaking, and the confidence and support it had elicited. And we are compelled for the same reason to overlook the appropriate remarks in which the Duke of Westminster bade the exhibition "good speed," and drew attention to the fertility of the surrounding country in traditions of artists, and treasuring and fosterage of art. He could not be silent touching two indigenous artists—our famous early landscape-painter, Richard Wilson, here represented in the region of his life, death, and (what was more for his genius, and for the credit of his birth-region) his encouragement; or another and later son of the soil, Downing, an A.R.A., who was born at Wrexham, and died too young for his fame, at his birthplace, in 1824. He was precluded by the exigence of relentless time and space from enumerating how many pictures of rare merit and local interest have been collected from the galleries of local contributors, the Duke himself setting the fashion with choice portraits of his ancestry, and gracefully finishing his boon with those three charming portraits of his daughters, by Millais. It gives a home-like character to the exhibition to note in the entrance-court the portraits of the daughters of the chief patron (under the Queen) of the undertaking, and the very beautiful likeness of Mrs. Cornwallis West, the wife of the Chairman of the Executive Committee, by an Italian artist. In the water-colour compartments there are other portraits of the same lady, as well as one on porcelain, which will be centres of attraction for the next three months.

A rapid glance at the entrance and central art gallery, with examples of the German, Dutch, and Flemish schools to the right, from the orchestra (which, by the way, has a splendid organ of Gray and Davison), and pictures of deceased English masters to the left, ought to satisfy the most critical that neither pains nor connoisseurship have been spared to make the selections, whether of ancient or modern specimens, *sui generis*—yes, and more than this, illustrative of local worthies, local traditions, and interests. Here we have, in a painting by Opie, *Sir Lloyd Kenyon*, Master of the Rolls, as well as others of himself and that pleasant-looking, piquant wife who was his first hostage to unexpected fortune, by Romney. We doubt all the same whether the best example of Opie is not *Youth and Age* in the entrance hall. *Richard Heber*, at thirteen years of age, is a picture by Oopley of rare and local interest, singularly attractive as a portrait; Pennant, the antiquarian and naturalist of North

Wales (for he was far more than a mere tourist and chronicler), is represented by Gainsborough, and not far from him are some absolutely bewitching portraits by the same master. This, be it said, is a spot of the exhibition to recur to. Nearly opposite, local claims and perhaps foreign masters have caused *Catherine of Berens*, the wife of four husbands, and mother of Wales, to be located, as well as Cornelius Janssen's fine picture of *Lord Keeper Williams*. By the same hand is a very charming picture of *Elizabeth, Queen of Bohemia*, and another of a Burgher's wife. To revert to local associations, and examples withal of early landscape, we find Wilson well represented, in ample as well as limited canvas, on the left of the orchestra. His landscapes reflect—besides two large paintings of Llangollen and its bridge—his native haunts; and his portrait by himself (lent by Colonel Cooke) bespeaks his inspiration and the *genius loci*.

Among less local portraits the eye is attracted to the Reynolds's; *Lady Betty Forster*, a new treasure-trove from the Wynn Ellis collection; the *Duchess of Westminster*, by Gainsborough; "*Serena*" (reading), with another perfect Romney above her, to say nothing of a *Countess of Derby* by the same master. We commend these to careful study. By some chance one or two Vandykes have slipped to the same side, though Mr. Gladstone's loan of *Sir Kenelm Digby*, by the same master, is rightly on the other. Several beautiful Lelys adorn the collection, and the Hampton Court beauties repeat themselves in miniature—by which hangs a tale, as they were painted to order from the originals at Hampton Court by Murphy, painter to the Princess Charlotte, repudiated by her, and bought by Sir Gerard Noel, from whom they passed by purchase to the present owner. On one side or other will be met paintings old and new, familiar and unfamiliar: Turner's *Battle of the Nile*; one or two familiar-looking Constables; two characteristic oval pieces of Angelica Kauffman, a Gerard Dow (*The Toper*), a Wouvermans, a Cuyp, to say nothing of Ostade, Snyders, and their schools and styles. Before a reluctant adieu to the paintings and portraits (for on the water-colours by David Cox, D. G. Rossetti, Madox-Browne, and Burne Jones, we have no time to touch), we claim a word for Lady Betty Forster's draperies: "a cream-coloured dress, grey hat, blue ribbons, and feathers!" With such a setting the inimitable pink-and-white is perfect. We confess to a kindred feeling with regard to the grey hat and grey and red feathers, with light blue sash around an indigo dress, in the much-noticed portrait of Mrs. Cornwallis West.

Almost inevitably, as was our fate, an early visitor to the Wrexham Art Treasures would find the officials in the agonies of ticketing and labelling, and in vexed and vexatious expectancy of the catalogues every train was to bring forth from South Kensington. Without these, for the most part, we could do but scant justice to a memorable effort. The pictures were least dependent on catalogues: but it would be blindness, as well as defect of generosity to the obliging and courteous promoters, if we did not note, in addition to these, a few of the precious treasures in the glass cases on either side of the chairs below the orchestra in the Art Gallery. Two such cases enshrine for the present a collection of Wedgwood's Jasper ware, so exquisite that no potter of the Etruria of to-day could approximate the secret of its beauty. The owner and lender is Mr. Felix Joseph. Hard by them and next the orchestra on the right are two "beautiful Limoges enamel oval Plateaux of the sixteenth century" (21 in. by 16 in.), one representing the drowning of Pharaoh and his host with Moses the central figure, surrounded by a rich bordering of grotesque animals, "rich blue ground and vivid colouring with paillettes;" the other representing Apollo and the Muses on Mount Helicon, in a similar bordering, and a tablet with the artist's name, Susanne Court.

These splendid enamels are lent by Mrs. J. Scott Bankes, and there is nothing finer in the whole exhibition, though Mr. J. F. Hutton's Limoges enamels and one or two others vindicate a title to be set near them. A similar eye-service is afforded by some of the carvings in "ivory and wood;" by the bronzes, metal work, and especially the pottery and porcelain. "Plate," "gems," and "miniatures," too, are the simple heads of three of the most precious collections of this temporarily accumulated treasure, upon which, catalogue in hand, the art-visitor will have a feast in store. It is only fair to all parties to add that it is as yet early days to inspect this *recherche* collection—while the pictures are being ticketed, and the process of labelling majolica, bronze, porcelain, or cameo has scarcely commenced. But with the energy of the Chairman of the Executive Committee, and the enthusiasm and experience of Mr. Chaffers, it is easy to predict that in another fortnight all will have settled itself into form and shape—in which event there should be no tourist in North Wales during the autumn who does not tarry at Wrexham; and no stay-at-home who does not break through his rule to view an assemblage of treasures that does the highest credit to the taste and cultivation of the North Wales border.

J. DAVIES.

THE UNIVERSAL EXHIBITION OF 1878.

I HAVE hitherto refrained from any mention of the Exhibition of 1878, because until now the plan was prospective and in the stage of discussion. In principle, the idea was generally accepted some time ago, but with regard to the mode of carrying it out the projects were various. To avoid saying a thing one day and contradicting the next, I waited for the passing of the Bill in the Chamber of Deputies; this took place a week or two since, and I am now in a position to be able to analyse the report which was read and officially adopted, and add my own reflections thereon. "It is good for France," said M. Journault, "after misfortunes unparalleled in her history to assert her vitality and her wealth. All other nations understand the feeling, and will hasten to respond. We may confidently state that unanimous signs of international sympathy have been shown." May 1, 1878, is the date fixed for the opening by the commissioners. They know that the time is short, and that great efforts are necessary in order to be ready by the appointed day. There is no doubt the work ought to have been begun as soon as public opinion, apart from Government, had decided that the thing was to be. But that would not have been legal. The Municipal Council first, then the Bureaux of the Chamber had to be consulted. And thus two precious months were lost by the lengthiness which distinguishes the regular course of public business. M. Viollet-le-Duc, one of the most enlightened promoters of the scheme, does not despair, but he did not conceal from the commissioners how short the time is if they hope to avoid those delays which have occurred in the case of previous exhibitions: lists have to be drawn up, lists of staff-officers and of workers; the proposals of the contractors have to be received, and definite orders forwarded to the great factories where the various portions of the vast *matériel* required are to be executed. Should bad winters be followed by late springs, there would be ground for great uneasiness. But the fact, on the other hand, must be taken into account that constructive implements generally, as well as all scientific processes, are more perfect than they were in 1867, the present proof of which is seen in the Exhibition of Philadelphia. The result, therefore, is assured, provided the orders be sent out at once, and committees appointed to arrange the intellectual programmes side by side with the material works. The site fixed upon is the Champ de Mars, which is placing the exhibition

almost in the heart of Paris. The Seine is already covered with steamboats, and, in addition to the tramways which already exist, new railways are to be laid down, which will increase the means of transport a hundredfold.

To the 420,000 mètres of the Champ de Mars the 150,000 of the Trocadéro, on the other side of the Seine, and bridges to connect them, are to be added. The Industrial section will be in the Champ de Mars, in a glass building to cover 243,000 mètres of ground. The Fine Art and Science sections are to occupy the Trocadéro. A monumental pavilion, flanked by two semicircular galleries, and from the base of which a large cascade is to flow, is to be erected on the top of the hill. The spot commands a fine view over the largest part of Paris—that which, with its splendid buildings, presents such a graceful and varied outline when seen from a distance. Here the *fêtes* will be held for which France is so famous. Here will be the galleries which are to be devoted to the history of labour in every age and among every people. They are to be so built as to outlast the present occasion, with a view to their becoming ultimately the property of the City of Paris and being turned into permanent museums. For years past, on all sides and in every possible way, I have been urging the foundation of a museum that should answer to your South Kensington Museum: I now hope that at last my dream is about to be realised.

Possibly some of the buildings in the Champ de Mars—about a third—will also be left standing. I dwell on these talked-of plans because they show that the ideas we have been zealously and patiently advocating for so long are beginning to make their way into the class who elected the new Chamber—the new social strata, that is to say. These new strata of society know well where, as regards the elements of a sound artistic, scientific, and professional education, their deficiencies lie, and their representatives, by at once and without discussion accepting this plan, which puts the artists, the scholars, the workmen of all time in direct communication with each other, have just given marked proof of a high degree of intelligence. But the problem lies not so much in the attempts at a permanent exhibition of which the Commissioners thus hold out hopes, as in the formation of extensive ethnographical museums, which teach by the eye what libraries are powerless to teach with printed paper, and professors by word of mouth.

The costs are estimated at 35,000,000 of francs, and the probable receipts at 19,000,000. The City, which will benefit in every sense by this great fair, will defray six of the thirty-five. The State takes the working of the whole thing into its own hands, which is an official guarantee that the hospitality offered to strangers will be properly dispensed, and worthy both of France and of her guests.

I on my own account would add that this exhibition should be worthy of the new political order of things which reigns in France, and that it should wipe out all the trivial memories of the last exhibition organised by the Imperial régime. To that end the committees whose business it will be to organise the different classes should consist of active young men, men who are devoted to the greatness of their country and the greatness of science. I shall speak of the plans in connexion with the Fine Art Department on another occasion. I think the ACADEMY ought to make itself known among us by its display of zeal in enabling us to know, feel, and appreciate the original and subtle art of England.

In the meantime, until these plans shall have been more fully matured, I may go on to tell you that ethnography is to occupy an important place in the galleries devoted to the history of labour. To study man both in his past and present; to study his qualities in their various modifications, as produced by the twofold influence of his social relations with his fellow-men and the centres in which

he lived; to reconstruct the history of humanity with the help of grammar and philology; to take as careful note of a costume as of a poem, of an article of faith as of a conformation of the jaw—all this is throwing light into the well where truth lies concealed. Prejudices vanish, and improvements suggest themselves. And, besides other advantages that will result from them, these anthropological galleries will, no doubt, if well organised—furnished, that is to say, with prehistoric skulls, with lay figures, clothed, armed, and painted from head to foot, to represent the Kaffir on his burning sands, the Japanese in his island home, the Oxford don in his study, the Esquimaux in his hut—these galleries will, I say, no doubt be one of the most instructive and most frequented parts of the exhibition.

Foreign Governments ought without hesitation to vote large sums for the laying out of gardens and the sending over workmen representative of their most skilled trades, those requiring imagination and delicate workmanship combined. The common people readily take in and assimilate instruction of this kind, and sights of this nature make a deep and lasting impression on the brain of a child. The large fairs which in former days were the centres of wandering trade were a source of wealth to the sellers of books. The universal exhibitions of our own day cannot fail to be of the greatest service to geography, history, and practical science. They give mankind a material idea of the unity of the human race. Now is the time for the philosopher to decide whether progress be not merely a Utopian idea, and whether man be not the happier for becoming more universal.

PH. BURTY.

ART SALES.

THE collection of pictures and water-colour drawings formed by the late Mr. W. A. Joyce was sold at Messrs. Christie's a few days ago, and was among the last of the sales of the season, as to the general character of which we may make a remark or two, after briefly chronicling the prices fetched by Mr. Joyce's pictures. These were:—Water-colour Drawing: W. Hunt, *All Fours*, 106*l*. Pictures: A. L. Egg, *Cromwell and his Chaplain*, 168*l*.; P. F. Poole, *"A Bit of Fun,"* 157*l*.; W. Collins, *The Sale of the Pet Lamb*, 325*l*.; T. S. Cooper, *A Landscape, with Cattle*, 110*l*.; F. Goodall, *The Woodman's Return*, 304*l*.; J. Linnell, sen., *A Running Stream, with Figures Fishing*, 430*l*.; J. Phillip, *Drawing for the Militia*, 194*l*.; O. Stanfield, *Roveredo*, 399*l*.; T. Creswick and R. Ansdell, England, 735*l*.

THE art-sale season, which began without the announcement or expectation of many sales of importance, has been after all a busy and notable one. Modern art—the work, at all events, of contemporaries—has hardly, indeed, held its own. Some of it has fetched sensational prices, but much of it, that is not undeniably of the first quality, has had to suffer marked abatement. Nor is it, perhaps, very probable that the scale of payment for contemporary art into which over-prosperous times had allowed us to slide will be quite fully resumed when the financial dulness of the moment shall be over. Owing to this financial dulness, some old masters' work in painting has not attained the accustomed prices when presented in auction-rooms. But this has been but occasional: as a whole, the supreme and unquestioned work of the real masters of past times has not suffered in money value; nor can it be likely to suffer hereafter, for it appeals to the cultivated and wealthy all over the world, and is independent of disturbance in any single community. The great works in engraving—those of Rembrandt especially—have shown no tendency to lose value. On the contrary, they have gained it, and for the reason before hinted at, that may apply to all first-rate work by old and admitted masters—a Rembrandt etching is sought after and wanted in Paris as much as in London, and there is as good a market

for it in Amsterdam, in Frankfurt, and in Vienna. Thus it is that at a time of great commercial depression the Sir Abraham Hume collection of Rembrandts, offered in London, realised prices which seemed only to betoken great commercial prosperity—the fact being that commercial depression in London alone was powerless to affect the value of things which are in demand in all the centres of civilisation. First in point of time, though by no means in point of importance, was the sale by Messrs. Christie, in the month of February, of the pictures belonging to Mr. Armstrong and to the Messrs. Collicie: the most noticeable fact in the Armstrong sale being the sale of a really great *tour de force* by Mr. Millais—the portraits of the Miss Armstrongs—for a sum much below what was said to have been given for it. Very important and excellent examples of Mr. E. Long may be remembered as having been in the possession of the Messrs. Collicie. The next sale of importance was that of a great number of sketches by De Wint, which until the moment of sale had remained in the possession of the family of this exquisite landscape-painter. The Levy Collection next engrossed attention: it was full of wonderful things, but there will always be remembered as its specialities the unexampled array of the works of David Cox (many of which, however, Mr. Levy had possessed for a very short time), the excellent exhibition of the works of our not yet sufficiently appreciated George Morland, and the pictures by the old Dutch masters, among which were some absolute masterpieces of Jan Steen, Mieris, and Gerard Dow. The Wynn Ellis picture-sales have from widely different causes been the talk of the season. They will be remembered as occasions on which some of the most perfect works by our last-century English painters were followed by the sale of canvases (purporting to be by old masters) such as do not often disfigure the walls of the great auction-rooms in King Street. To these sales succeeded that of the small and most chosen collection known as the Clewer Manor pictures—works of a perfection such as is but seldom to be met with beyond the most treasured ornaments of our public galleries. Lastly, of print sales there have been three specially noteworthy—the sale of Sir Abraham Hume's marvellous collection of Rembrandts, mentioned before; the sale of M. Burty's collection, remarkable for quality; and that of Mr. Anderson Rose's, remarkable for size.

NOTES AND NEWS.

THE Autotype Company (Rathbone Place) have just published a head of the Magdalen after a drawing by Mr. W. Cave Thomas, designed as a companion to the autotype of *Christ Crowned with Thorns*, by the same artist, which some two or three years back obtained well-deserved and widespread acceptance. As examples of drawing carried up to the most elevated standard of the English school, we wish to call attention to these two heads. The observation forces itself upon us that, whereas a rising and highly susceptible school of English criticism is boundless in its admiration of French draughtsmanship—no matter what branch of that school the examples may belong to, or how divergent their aims may be—specimens of such extreme mastery and perfection as those now under consideration, when by an English hand, fail to extort even a passing word of praise. Experts who go into raptures over the productions of the French landscape school decline to notice similar qualities in the work of Anthony or William Davis; and, while pronouncing panegyrics *ex cathedra* upon French drawing, they are blind to the admirable qualities of such native draughtsmen as the late William Dyce, Sir Noel Paton, or Mr. Cave Thomas. Sad and elevated in expression, and faultless in their perfection of modelling, the *Christ Crowned with Thorns* and the *Magdalen* reflect great credit on the publishers also, who thus place within reach

of the ordinary purchaser specimens of a branch of English art but too little to be met with in our exhibitions, and equally suitable for guiding the studies of the amateur or the school-class. In fact we should like to see a series of heads from nature, by the same hand, brought out with a view to assist good drawing. The same company has published other remarkable works by Mr. Thomas—*Christ Lying on the Cross*, and *The Fate of Benefactors*: for our present purpose, however, the two smaller examples serve best by way of illustration.

ANOTHER vast painting by M. Gustave Doré (30 feet by 20) has been lately added to the Doré Gallery 35 New Bond Street: it represents *Christ entering Jerusalem*. Leaving aside the question of its size, this is one of the most ordinary and least interesting pictures in the collection. Indeed, we should say that the subject itself is a very jejune and unrepaying one; though something may be—and already has been—made of it by such an expedient as that of Haydon, who gave the head of Voltaire to a scoffer, and of Wordsworth to a disciple, and concentrated the attention on the incident of a frail and penitent girl in shame and adoration. In M. Doré's picture we have of course the essential points—Christ riding forwards on the ass-colt, the acclaiming multitude strewing and waving palm-branches, disciples and adherents of both sexes and all ages, some signs of antagonism amid so many of welcome, a Pharisee at one end and a Roman soldier at the other. The colour and effect are bright, without much to concentrate or exalt the general impression of these elements of the subject on the eye and mind. It should be said in justice to the painter that the head of Christ himself—that supremely difficult attempt—is, in proportion, fully as successful an achievement as the other heads generally, or the remaining constituents of the picture.

MR. WILLIAM M. ROSSETTI has lately joined the staff of contributors to the new *Encyclopædia Britannica*; revising, and sometimes writing anew, many of the articles on painters and other artists of the Italian and other schools; Canova, Cellini, Cimabue, the Caracci, Claude, Charlet, &c.

MR. J. P. HESLITINE was incidentally mentioned in the last number of the ACADEMY in an art review from Paris, as having "bitten" the plates of the few prints by Frederick Walker issued not long ago. Mr. Heseltine's own etchings, we may here take occasion to say, deserve to be known by a wider public than that which is at present acquainted with them. They are technically sometimes at fault, but they have the great qualities of originality, artistic feeling, and simplicity of truthfulness. Some of them, we believe, remain unpublished, though isolated impressions of these have been seen here and there at exhibitions; but one series was issued about three years ago by Mrs. Nosedá: a limited number were printed, and the plates destroyed, so that probably very few still remain to be sold. These published etchings are all of them truthful and unaffected sketches from nature, as nature presents herself in landscapes among the least celebrated in England. They do not contain a single view such as the tourist goes out for to see, but they render in black and white just that common and everyday landscape of open heath, and rising field, flat coast and sluggish river, which sixty years ago was not unworthy of the art of Crome; and they render it with a dainty simplicity that reminds one of certain of the studies for landscape by Mason and Frederick Walker. Mr. Heseltine is, indeed, one of the most sensitive observers of fact now handling the etching-needle, and the closeness of his observation by no means shuts out poetical feeling; on the contrary, the presence of poetical feeling is sufficiently proved by the charm that, without idealisation, he knows how to bestow on the simple and everyday subjects of his choice. One of his more ambitious

subjects—that known as *Aylmerton, Norfolk*—is one of his least successful; he is not always a master of the effect of distance when that has to be expressed by gradations of tone, but he is quite a master of it when he places his main reliance on design and perspective. This is shown unmistakably in the long but small landscape in which a creek or deep draining ditch runs alongside of a river, which at last flows out sluggishly to sea between low and barren banks, and by some few boats and a yard for boat-building. Not many landscape-etchings are so exquisite as this in design and result. We may mention another, which is of admirably harmonious tone and more obviously poetical effect; it is called *Rundhurst*, and represents a secluded place in the heart of the southern counties, where an old stone gateway stands at the entrance to some little-trodden garden, and the wavering lines of a poplar rise dark against a quiet sky. This is entirely delightful. Mr. Heseltine should be induced to publish some of his still more recent work, the things we know already in Mrs. Nosedá's issue of three years ago having the peculiar and personal qualities so precious in art, and workmanlike ability to boot.

MR. E. BINYON, a painter well known and esteemed in the island of Capri, died there lately of heart disease, having suffered severely after bathing while he was heated. He leaves a wife and three children. The present Royal Academy Exhibition contains a well-sized picture by this artist, capably and carefully painted, *Vesuvius and Naples from Capodimonte*; he had also frequently contributed to the Dudley Gallery.

MR. SHIELDS, an associate of the Water-Colour Society resident for several years past in Manchester, has lately returned to England from a tour in Venice, Florence, and other Italian cities, and is likely to settle in or near London.

IN the Athenian newspaper *Ἦρα* of the 2nd ult. will be found a summary of the discoveries at the foot of the Akropolis up to the beginning of last month. The number of inscriptions discovered up to June 25 was eighty—of which forty-eight are of the best period—and the number of fragments of sculpture eighty-two, of which three are thought to belong to the frieze of the Parthenon. On July 1, about forty additional fragments of sculpture and inscriptions were found. Among the most remarkable inscriptions are the following:—A treaty between the Athenians and Arkadians in the archonship of Molon, B.C. 362, containing nineteen lines. A fragment of a dramatic didaskalia; a report of the Commissioners appointed in the archonship of Diokles for the taking down and repairing the Anathemata in the Asklepieion—this inscription alone would prove that the foundation-walls discovered on this site are those of the Asklepieion—a dedication to Asklepios and Hygieia, by Flavius Epiktetos, inscribed on a base on which are sculptured two feet. The dedicatory may have suffered from gout. Several sculptures in relief representing, probably, families or individuals who had been patients in the temple of the god, are described in this report, and two male heads, sculptured in the round, one of which exceeds life-size, and both of which are thought to represent Asklepios. The *Πατρυγενεία* of July 10 states that since the discoveries reported in the *Ἦρα* a female head of heroic size has been found on the same site. This is thought by Prof. Rhousopoulos to be possibly from one of the pedimental compositions of the Parthenon. The same journal reports the discovery of a decree dated in the archonship of Lyssander, son of Apolexis, relating to the repairs and fitting up of the Asklepieion.

A BUST of the late Dr. Edwin Norris, by Mr. Charles Summers, has just been placed among similar memorials of the "Worthies of Somerset" in the entrance of the Shire Hall, Taunton.

A VERY fair wood-engraving of Mantegna's cartoon of *The Triumph of Julius Caesar*, at

Hampton Court, has been published by the *Architect*. Three compartments have been given in each number from July 15.

IT is stated that Earl Spencer has promised to lend some of the principal paintings from his gallery at Althorp for exhibition at the South Kensington Museum. There will be plenty of room for loans of this kind now that so many galleries have been left vacant by the removal of the collection of British masters to the National Gallery.

THE first volume of an important work on the History of Italian Art, entitled *Le Arti del Disegno in Italia, Storia e Critica*, by the distinguished art-critic the Marchese Pietro Estense Selvatico, has just been published by Francesco Vallardi, of Milan.

Two life-size ceremonial portraits of the King and Queen of the Belgians, by the distinguished Belgian painter Louis Gallait, have been on exhibition since July 13 at the Brussels Museum. The king is represented standing with his right hand on the manuscript of his celebrated inaugural discourse of December 17, 1865, in which the words "un roi belge de cœur et d'âme" that have become almost historic in Belgium are distinctly visible. Both likenesses are said to be excellent, and to be free from that stiff mechanical dignity which usually distinguishes works of this sort.

THE project for a school and manufactory of mosaic at Sévres, mentioned some time ago in the ACADEMY, has by no means been given up. On the contrary, we hear that its organisation is likely soon to be accomplished. M. Gerspach, who was sent last year on a mission to Italy in order to collect as much information as possible with regard to the Italian modes of manufacture, has lately returned, bringing with him a large number of reproductions of ancient mosaics—taken, we believe, by the same process as those at South Kensington—which are now being exhibited at the Ecole des Beaux-Arts. It is thought that such reproductions cannot fail to be extremely useful in the education of artists for this kind of work. Beside these, M. Gerspach has collected a number of small vitrified cubes called by the Italians *smalti*, and various other materials, such as marble, agate, different kinds of pebbles and stones, that have been used from the earliest ages in the preparation of mosaic. By the scientific examination of these specimens it is hoped that a more thorough understanding of the nature of the substances required for mosaic will be gained.

THE Dresden *Anzeiger* records the discovery of an unsuspected hoard at the Rathhaus of Bautzen. In an old wooden chest, stowed away in one of the upper rooms and supposed to contain merely old documents of no particular value, there has recently been found beneath the papers a number of silver vessels, such as drinking-cups, chalices, spoons, etc., dating from the seventeenth century. It is not known how they came there. The collection has been placed for the present in the town museum.

A STATUE to Thorbecke, the great statesman and patriot to whom Holland chiefly owes her re-constitution in 1830, has recently been set up in Amsterdam. It is by the Dutch sculptor Leenhoff.

THE Munich Cabinet of Prints and Drawings has lately added to its collection a number of water-colour studies of the Court-painter, Leopold Rottmann. They are mostly hunting-sketches and views taken during expeditions with Maximilian II., which afterwards served as studies for a series of water-colour pictures which Rottmann executed for that monarch.

THE distinguished German authoress, the Countess Hahn-Hahn, has recently provoked a most bitter controversy on the subject of religious art by a little pamphlet entitled *Die Kunst in der*

Muttergottes-Kapelle des Domes zu Mainz, which she has published for the small price of 10 pfennige, in order, say her opponents, to give it the utmost possible notoriety. The question turns on the proper position and dimensions of the altar in the Christian Church, and has been discussed with about the same amount of angry feeling as that excited by the erection of the reredos at Exeter.

THE various historical and art collections of the *Kaiserhaus*, or Imperial Burg, at Vienna, are at present undergoing a complete reorganisation. A new system of administration of the Austrian Museum has lately been entered upon, whereby the accumulation of different departments under one director has been to a great extent avoided, and the directors or keepers of each collection left more free to act in the interest of their special department.

THE *Zeitschrift für Bildende Kunst* has nothing worth notice in the way of art this month. Its only etching is a view of the ruined temple of Juno Lucina at Girgenti, by L. Lincke—large, dreary, and monotonous. Josef Durm describes with great detail the Villa Lante near the little town of Bagnaia, and the cloister of Sta. Maria della Quercia, both places very little known to travellers, as they lie aside from the regular route to Rome. The villa, however, is mentioned in Percier and Fontaine's *Choix des plus célèbres maisons de plaisance de Rome et de ses environs*, 1809, and, if it in any way equals its description, is certainly worth a visit from those who have exhausted the more regular show-places around Rome. It was first built in 1477 by Cardinal Sansoni Riario, and was for about a century and a half a favourite residence of the Cardinal-Bishops of Viterbo. Pope Alexander VII. then gave it to a Duke of the Lante family, and it has remained in the possession of that family ever since. It is well preserved and not modernised, although it is occasionally used as a summer residence by its present owners.

THE STAGE.

THERE have been revivals this week, but only of familiar things, and other revivals of things as familiar are promised us. The Strand and the Globe are two theatres at which the programme has been changed. *Paul Pry*, too, has been played for a few evenings at the Gaiety. The often-seen burlesque of the *Field of the Cloth of Gold*—which is by no means the dullest effort of its author—has been reproduced at Mrs. Swanborough's theatre. At the Globe, soon after the departure of Mdlle. Beatrice and her company—who are at this moment acting in the provinces—Mr. J. A. Cave, Miss Lynd, Mr. L. Harcourt, and other performers appeared in *Kathleen Mavourneen*. Mr. Cave has often before now, we hear, played the part of Terence O'Moore, but never before a West End audience. The audience at the Globe on Saturday night signified approval of his humours and was right enough in doing so, but a "West End audience" it can hardly be called—it was an audience at a West End theatre, but a "West End audience" (the term is supposed to convey some dignity) cannot be seen within the walls of a theatre in the beginning of August, for the simple reason that it does not exist. Mdlle. Beatrice, for instance, when she comes to town, as she often does at the summer's end, comes practically to play to the provincial visitor. The little piece called *Dancing Dolls*, which followed the more important drama on Saturday at the Globe, brought for the first time on to the boards of a regular theatre a Miss Fanny Leslie, from America. We have somewhere seen the statement that she has found much favour at the music halls. That may not be correct, but were it correct it would be less against her than it sounds. A music hall may undoubtedly seem but a poor place to hail

from; yet from such a place more than one noted and meritorious low comedian has emerged on to the London stage. Nor is this to be wondered at, for, as certain of the theatres have chosen to usurp the functions of the music halls, certain of the music halls have done their best to show their patrons comic actors of a talent not destined to be for ever associated with the pipe and the pot and the promenade in which introductions are held to be superfluous.

MR. EDWARD TERRY, who for several years has been amusing the audience at the Strand, amused them for the last time on Saturday, when, previous to starting for a holiday in Switzerland, he bade farewell to his patrons on the afternoon of his benefit. On returning to town, Mr. Terry appears at the Gaiety. At his benefit Mr. Terry delivered some sufficiently funny verses which Mr. Byron had written for him, Mr. Grossmith appeared in an entertainment, Miss Jennie Lee danced a dance, the Strand company played in a popular piece, and Messrs. James, Thorne, Farren and Sugden, and Miss Larkin, Miss Bishop, and Miss Amy Roselle performed the second act of *Our Boys*. The audience was large, and the enthusiasm great.

MISS MARIE LITTON will reappear in the country in August, the *Era* assures us, in company with Mr. and Mrs. Chippendale.

MR. SOTHERN, who has been until lately acting in New York, will reappear in London, in October, it is said. The comic actor's last engagement here came to a somewhat speedy termination.

THE Gaiety Theatre is the next to which *All for Her* is to be transferred. Mr. John Clayton, after his holiday, will appear at that playhouse in a piece which is admitted to be among the most deservedly successful that recent years have given to the stage.

MR. EDGAR BRUCE, it is said, will be the next tenant of the Globe Theatre, whither Miss Jennie Lee, at the end of her absence from town, will return with the drama founded on the Joe of *Bleak House*.

MR. HERMANN VEZIN now plays the parts of Fabien and Louis dei Franchi in the continued performances of the *Corsican Brothers* at the Princess's Theatre, which Mr. John Clayton has left.

MISS NEILSON will go to America in the early autumn.

A ONE-ACT pathetic drama has, it is said, been accepted at the Prince of Wales's Theatre, for Mrs. Bancroft. One is glad of this for more reasons than one. Anything is good which tends to break down the old-fashioned belief that a one-act drama cannot have importance enough to demand the service of a leading actor in its interpretation. And again, the artistic public is beyond question the gainer when Mrs. Bancroft devotes herself to the realisation of a pathetic character. Mrs. Bancroft's popular successes have been gained in comedy, and in comedy of the lightest kind; but the most genuinely noteworthy of the achievements of this artist have been in a piece of which the best part was of unrelieved pathos. Mrs. Bancroft's pathetic acting is of so excellent a kind that it might almost have inspired the familiar exclamation of Croaker in the *Good-natured Man*—"It is a perfect consolation to be miserable with you."

A NEW piece was promised for this week at the Gymnase Theatre—*La Crise de M. Thomassin*, a three-act comedy by M. Vercousin.

MDLLE. CROIZETTE, who has been ill, will not make her reappearance at the Français till the beginning of the autumn, it is said.

La Fille de Roland—M. Henri de Bornier's patriotic drama, reviewed in these columns a good deal more than a year ago—has now taken its

place definitely, it may be presumed, in the repertory of the Théâtre Français. It is played occasionally during the present summer season.

THE Paris Vaudeville has at last closed its doors, leaving only eleven theatres open in Paris. And of these, many are just now presenting such worn-out pieces and drawing such scanty audiences, mostly supplied with free admissions, that they can hardly be said to be "open" in the sense in which that word is used in winter of the theatres. The Français, the Palais Royal, and the Variétés are alone, it is said, frequented by audiences numerous enough to justify their continuing the performances.

THE competition for prizes among pupils of the Conservatoire in Paris, which, as we briefly chronicled on Saturday, took place last week, is a very serious affair. The range of buildings devoted to the Conservatoire contains a small private theatre, and this is crowded from nine in the morning till about five in the afternoon on the day of the competition, and crowded not only by friends of the competitors, who are there naturally, but by as many actors and actresses as can gain admission, and by the critics. The jury is composed of some half-dozen men, among whom are always eminent actors and writers. It is very much the fashion among the writers who do not form part of the jury to complain of the system, and to urge that the Conservatoire does not produce good actors. "See!" they say; "these are the best you have to show us this year—are they really actors?" It may be answered that the Conservatoire cannot hope to turn out accomplished actors; it is much if it turns out promising ones, with a certain amount of training now added to their native talent and developing it. But this year the grumblers have been present as usual, and this year it is true that the Conservatoire has not, as far as its women are concerned, produced any one commanding the immediate enthusiasm which was expressed on previous occasions by the assembled company for Mdlle. Legault and for Mdlle. Samary, the niece of the Brohans. In the department of tragedy there were this time two candidates, neither of whom was adjudged worthy of any prize at all. Last year there had not been a single candidate. And in comedy the appearances have not this year been very brilliant, though a second-class prize has been bestowed on Mdlle. Carrière. She is a pupil of Regnier, the best teacher in France since Samson, there is no doubt: as up to a short time ago, when he chose to retire, he was one of the very best actors. Mdlle. Carrière had chosen as her test-passage (for the choice of passages is allowed to the candidate) a somewhat easy piece from *Un Mariage sous Louis Quinze*. Mdlle. Carrière is pronounced by the best judges to be an excellent pupil; but, as she has been at the Conservatoire a considerable time, and appears now to require only the experience of the stage, she is advised to leave it. Two *premiers accessits* were given to Mdlle. Girard and Mdlle. Bernage; both of these pupils are extremely young. Among the men it is the good fortune of the jury to have discovered a *jeune premier*: a *rara avis* indeed, not more easily found than a first-rate tenor. Davigny last year obtained a second prize. Since then his progress has been so marked that there is every reason to think that before another twelvemonth is over he will be doing, at the Théâtre Français, something that will be talked about. The success won by him last week at the Conservatoire was obtained in a scene from Diderot—from the *Père de Famille*—the scene in which Saint Albin narrates to his father how it was he fell in love with a poor girl and vowed to marry her. The recital is simple and touching, and we are assured that it was given by the young actor Davigny with excellent sensitiveness and discretion: "sans éclat de voix, sans gestes; on eût dit l'homme même." Before closing our account of

the competition we may mention, as a proof of the usefulness of the Conservatoire well within the London playgoer's knowledge and power of verification, that the actor Marais, who played so excellently the part of the young Russian lover in *Les Danicheff*, came straight to that part from the Conservatoire, and so with no experience of the stage other than the Conservatoire could give him. How well he played the part, we saw at the St. James's Theatre but a few weeks ago.

MUSIC.

WAGNER'S "RING DES NIBELUNGEN."

(Third Article.)

In the *Götterdämmerung* (the "Dusk of the Gods") is presented to us the catastrophe of the great drama which we have followed hitherto. Thus far the curse attached to the ring has proved fatal to all drawn beneath its spell. Fasolt, its first possessor, has fallen by the club of his brother; Siegmund, though only an unconscious instrument in the hands of Wotan, has been slain by Hunding; nay, the god himself has not escaped, for has he not been compelled to order the death of his beloved son, and to banish for ever his favourite daughter? Fafner, who held, and Mime, who coveted, the ring, have met with death by the hand of Siegfried; and we shall now see how the hero himself, though absolutely free from guilt in the matter, is none the less brought under the influence of the curse.

Siegfried, it will be remembered, ends with the scene of the waking of Brünnhilde by the youthful hero, "der das Fürchten nicht kennt." Some time has elapsed since then; the lad has become a man, in the full vigour of his powers, and his fame has spread far and wide. He is still living with Brünnhilde on the "Walkürenfels" where he first found her; and it is here that the action of the *Götterdämmerung* opens. The drama is preceded by a long introductory scene. As the curtain rises, we see the rock of Brünnhilde; it is night, and in front of the cave which forms her abode the three Norns (Fates) are spinning the thread of destiny. In mysterious tones they refer to the past, and predict the future, while they pass the thread from one to another; they foresee the approaching end of the gods, and ask when it will be; but to this they get no answer, for the thread snaps asunder, and affrighted they vanish.

Day dawns, and Siegfried and Brünnhilde, the former in full armour, the latter leading her horse by its bridle, enter from the cavern. He is about to leave her in quest of new adventures, and in a most splendid scene, which is at once a continuation of and a pendant to the final duet of *Siegfried*, the pair bid each other farewell. As a parting love-token, he gives her the fatal ring, of which he little divines the importance: to him it is merely a memento of his victory over Fafner; he knows not the curse attached to it. She gives him in return her horse; he leaves the mountain, and his horn is heard from the valley below.

The great significance and dramatic beauty of this prelude to the drama become apparent as we proceed. The first act commences in the hall of the Gibichungen on the Rhine. Gunther, the son of Gibich, and his sister, Gutrune, live there with their half-brother, Hagen, the son of the Nibelung Alberich. Hagen knows the history of Siegfried and Brünnhilde; he knows also the power of the ring, and is determined to obtain it for himself. This, however, he can only effect by stratagem. He advises Gunther that he should endeavour to obtain Brünnhilde as his wife, and, in reply to questions, says that her dwelling is surrounded by fire, and that only Siegfried, the noblest hero in the world, can win her for him. He suggests that this may easily be effected if they can render Siegfried enamoured of Gutrune, and for this purpose he has a potion, the effect of which will be to make the hero forget

that he had ever seen a woman previously. To Gunther and Gutrune, who know nothing of Siegfried's marriage with Brünnhilde, the plan seems excellent. Siegfried's horn is heard on the Rhine below, and Gutrune retires to put the project into execution. The hero enters, and is warmly received by Gunther and Hagen. After some conversation, Gutrune approaches from her room, and offers Siegfried a draught, in token of welcome; he takes it, and aside pledges the cup to Brünnhilde's love, which, though he suspects it not, he is renouncing for ever. He drinks the fatal draught; all recollection of his bride deserts him, and he is at once struck by the charms of Gutrune, and offers himself as her husband. He asks Gunther whether he is married; Gunther replies that he has fixed his hopes on one whom he cannot obtain, and that only one who breaks through the fire can court Brünnhilde. At this name a blank look comes over Siegfried's countenance: he has entirely forgotten her; but, saying that he fears no fire, he offers to obtain Brünnhilde for Gunther, if the latter will give him his sister as a wife. The bargain is concluded; the two men swear an oath of "blood-brotherhood," and depart for the Walkyr's rock, leaving Hagen to guard the hall. The scene changes to the mountain height where Brünnhilde awaits her lord's return. To her enters hastily Waltraute, one of the Walküren, who comes from Walhalla in deep distress, and tells Brünnhilde of the trouble of the gods. Wotan had returned home one day with his spear broken; a hero had cut it in sunder. He had ordered the noble ones of Walhalla to cut down the "world-ash" from the wood of which his spear was made, and to pile the stem in logs round the castle of the gods. Then in solemn silence he had assembled gods and heroes in the great hall; there they sit motionless, awaiting their approaching end. The Walküren, weeping, surround their father, and Waltraute hears him say to himself, "If she gave the ring back to the Rhine-daughters, gods and the world would be freed from the curse." Then Waltraute hurries to Brünnhilde to implore her to fulfil Wotan's wish; but the latter has found her heaven in Siegfried's love; her sister has brought no message of forgiveness from her father, and she declares that sooner than she will give away the love-token Walhalla shall fall in ruins. Waltraute, with a cry of "Woe to the gods!" hastens away. Evening draws on, and Brünnhilde with delight hears Siegfried's horn below; she hurries to meet him, and he appears—but not in his own form. He has put on the Tarnhelm, which enables him to assume any shape, and he is come in the likeness of Gunther. Brünnhilde warns him back, and holds out the ring which makes her strong against all comers. They wrestle, and he forces the ring from her. Her might is gone; she can resist no longer. Siegfried orders her into the cave, and before following her draws his sword, which he will place between her and himself, as a sign that he has not wronged Gunther.

The second act passes on the banks of the Rhine, in front of the hall of the Gibichungen. It is night, and Hagen, spear in hand, and shield on arm, is sitting asleep at the door. Kneeling in front of him is his father Alberich, who addresses him in his sleep, warning him to be true, and to obtain the ring. Hagen, still dreaming, replies, "I shall have the ring, wait in peace!" "Dost thou swear it to me, Hagen, my hero?" "I swear it to myself; be not anxious!" Alberich gradually vanishes, and his last words are heard, "Be true, Hagen, my son, be true—true!" Siegfried suddenly steps from behind a bush on the shore, as the morning dawns, and wakes Hagen, who summons Gutrune to hear the success of the adventure. To them he recounts his courting of Brünnhilde, under the likeness of Gunther, and tells them how he had kept faith with his friend, by placing his sword between himself and the bride. Gunther and Brünnhilde are already on their way, and Gutrune, followed by Siegfried,

enters the house to prepare for their reception. Hagen, by blowing an ox-horn, summons the retainers of the house of Gibich, ostensibly to receive the bridal pair, but really to aid in his designs against Siegfried. A boat approaches, in which are Gunther and Brünnhilde. They land; the latter pale, and with downcast eyes, slowly follows Gunther; Siegfried and Gutrune come out of the house, and Gunther salutes them by name. At the mention of Siegfried, Brünnhilde for the first time looks up, but, to her astonishment and horror, Siegfried does not know her. She sees her ring on his finger, and asks him how he came by it, for that Gunther had snatched it from her. Siegfried replies that he had not received the ring from him. She turns to Gunther, and asks where was the ring that he took from her? But he knows nothing of it, and remains speechless. Brünnhilde then sees the true state of the case, and declares that Siegfried was the treacherous thief who tore the ring from her. Siegfried, who in consequence of the potion he had drunk has no recollection of any of the incidents of his connexion with Brünnhilde, replies truly enough that he knew the ring well, and that he took it from the dragon that he had slain. Brünnhilde, beside herself with fury, declares that he is a traitor, and that it is to him, not to Gunther, that she is married. Siegfried reminds her that she is wronging her own good name, and tells all how he had separated himself from her by means of the sword. Brünnhilde, from a loving woman now transformed into a raging fiend, is utterly reckless of her own reputation, and declares that he lies. Gunther, Gutrune and the vassals call upon Siegfried to clear himself, and he takes a solemn oath on the point of Hagen's spear that he has kept faith with his brother. Brünnhilde steps furiously forward, pushes Siegfried aside, and swears that he is a traitor and a perjurer. Siegfried attempts to comfort Gunther with the assurance that she will soon come to herself, and with Gutrune and the vassals retires into the hall to prepare for the wedding-meal. Brünnhilde, Gunther and Hagen alone remain. Hagen offers to avenge Brünnhilde's wrongs, but with a bitter smile she tells him he is powerless. He asks whether Siegfried's treachery is proof against his spear, and she says that she has charmed him against all wounds, and that in fight nothing can hurt him. "Yet," she adds, "if thou dost strike him in the back—I well knew that he would never turn his back to an enemy; that, therefore, I did not charm." "And there," replies Hagen, "my spear shall pierce him." Gunther is still unwilling to believe in his friend's treachery, till Brünnhilde tells him that he had been deceived, and that all the blood in the world would not expiate the offence. Gunther at length reluctantly consents, and it is arranged that a hunting-party shall be formed on the morrow, and that Hagen will then have his opportunity. The three unite in an oath of vengeance, and Siegfried and Gutrune, with the attendants, meet them as they enter the hall to the bridal feast.

It is impossible, without quoting the entire dialogue, to give any idea of the sustained force and passion of this great scene, which seems to rush along like a flood of boiling lava. There is nothing more impressive in tragedy than this second act; and, it may be added, there are few scenes more imperatively requiring the highest order of acting to render them adequately.

After the stress and storm of what has passed the opening of the third act is a most grateful relief. The scene is a wooded and hilly spot on the banks of the Rhine. The three Rhine-daughters, whom we met in the first scene of the *Rheingold*, are swimming in the waters, but there is an indefinable difference in the character of their song. One feels its affinity with what we have heard before, but all its light-heartedness is gone. They have lost the Rhine-gold, and their sole anxiety now is to recover it. Siegfried ap-

pears on an overhanging crag, and they ask him for the ring, which he refuses. Half in sport, half in earnest, they accuse him of greed, and, telling him he ought to be generous to ladies, dive below the waters. He knows nothing of the value of the ring, and calls to them that if they will come he will give it them. They reappear, but now earnestly warn him against the danger connected with it. They tell him that a curse is on the ring, and that it will cause his death that very day. These words, however, have the opposite effect to that intended: though ready enough to part with it, he will not be frightened into giving it up; and the Rhine-daughters leave him, saying "A proud woman will this day inherit what is thine; she will give us better hearing!" Gunther, Hagen and the retainers now approach; they have missed Siegfried in the chase, and ask him how it has fared with his hunting. He says that the only quarry he had found was three wild water-fowl, who had told him he was to be slain that day. The whole party sit down in the shade to rest; the drinking-horns are passed round. Hagen asks Siegfried if the report that he understands the song of birds is true. Siegfried replies that he has forgotten it since he heard the voices of women. He offers to sing Gunther stories of his young days; a circle is formed round him, and he begins. He tells how he was brought up by Mime, how he forged the sword Nothung, and slew Fafner with it, how when he tasted the blood of the dragon he understood the song of the bird. Hagen interrupts him to offer him a drink which shall revive his memory. Siegfried drinks, and proceeds with his narrative, telling as his memory returns exactly what we already know from the second act of *Siegfried*. At the first mention of Brünnhilde's name, Gunther is astonished; but when Siegfried sings how his kiss wakened her, his friend understands all that is past. At that moment two ravens start out of a bush, hover over Siegfried, and fly away. Hagen asks if he understands what those ravens say. Siegfried turns round to look after them, and thus exposes his back to Hagen, who pierces it with his spear. Gunther in vain attempts to arrest the blow. Hagen declares that he has taken vengeance for perjury, and turns slowly away. Siegfried dies with Brünnhilde's name on his lips. The retainers raise the corpse on a shield, and bear it away in solemn procession, Gunther following.

The final scene shows us once more the hall of the Gibichungen. It is night, and Gutrune, who is anxious for Siegfried's return, comes out of her chamber. Evil dreams disturbed her sleep; she hears his horse whinnying wildly; Brünnhilde's laughter had awakened her; she had seen her going down to the Rhine; she fears the woman, and longs to see Siegfried once more. The voice of Hagen is heard calling to her, and the funeral procession enters with torches and firebrands. At the sight of the corpse Gutrune faints; on coming to herself, she accuses her brother of her husband's murder. Gunther replies that it is Hagen who has killed him, and Hagen boldly avows the deed, saying that the spear on the point of which Siegfried had perjured himself had avenged treachery. He therefore claims the ring as booty. Gunther declares that it belongs to Gutrune; Hagen draws his sword, and says that the son claims his father's inheritance. They fight, and Gunther is killed; once more the curse has worked! Hagen goes to snatch the ring from Siegfried's finger; to the consternation of all, the dead man's hand is raised with a threatening gesture. At this moment Brünnhilde slowly and solemnly steps forward from the background. His wife, whom all have betrayed, will avenge the hero. Gutrune accuses Brünnhilde as the cause of all this evil, in that she had stirred up the men against Siegfried. "Silence, wretched woman!" replies Brünnhilde. "Thou wast never his wife, thou wast only his concubine. I am his lawful wedded wife, to whom Siegfried swore eternal oaths, before ever

he saw thee!" Gutrune in despair now understands that it is through Hagen's accursed potion that Siegfried has been made to forget Brünnhilde; she turns away and leans over her brother's corpse in the deepest grief. Brünnhilde orders a funeral pyre to be erected, on which Siegfried's body is placed, and then, in a speech of wonderful poetical beauty and pathos, does justice to the character of the departed hero. As her inheritance she claims the fearful ring; from her ashes the Rhine-daughters shall receive it once more; the fire that consumes her shall purify the ring from its curse. The end of the gods is at hand; for the flames rising from the funeral pyre shall ascend to Walhalla; the old dynasty shall pass away, and the reign of love take its place. She throws a firebrand into the midst of the pile, which immediately blazes up. Her horse is brought in: at the sight of him her old Walkyriature returns; in tumultuous joy she addresses her steed—he and his mistress shall be united for ever with Siegfried. She springs hastily on to her horse's back, and at one bound vaults into the midst of the flames. At once they rise, so as to fill the whole stage and the hall itself. Suddenly they disappear, and a thick smoke fills the air; when it clears away we see that the Rhine has overflowed its banks, and spread over the burning pyre, even to the threshold of the hall. On its waves swim the three Rhine-daughters. At the sight of them, Hagen is seized with the utmost terror; crying "Back from the ring!" he plunges madly in the flood. Woglinde and Wellgunde encircle his neck with their arms, and drag him down in the depths, while Flosshilde swims before them, holding the ring triumphantly aloft. A red glare is seen in the sky: it becomes gradually more distinct, and the hall of Walhalla is seen, with gods and heroes assembled, as in Waltraute's description in the first act. Fire breaks out in the hall of the gods, and when everything is enveloped in the flames the curtain falls.

I fear I have already trespassed very largely upon the patience of my readers; but the poem of the *Ring des Nibelungen* is so elaborate that to do anything like justice to it would require at least a volume. As it is, I have given only a very meagre outline of this most remarkable libretto, dealing merely with its externals. Into its deeper bearing, the many most interesting details, its delineations of character, and, most of all, that wonderful internal coherence which gives it the appearance of an organic growth rather than of a series of incidents skilfully put together, it is impossible to enter. For these points readers must study the poem for themselves. Next week a few remarks will be made on the music to which the text is wedded. EBENEZER PROUT.

THE Balfé Memorial Festival, held at the Alexandra Palace on Saturday last, was numerously attended, and proved in every respect a success. The performance of the ever-popular *Bohemian Girl*, ably conducted by Mr. Weist Hill, left nothing to be desired, notwithstanding the change of arrangements which was found necessary almost at the last moment. The opera was preceded by a concert in the Great Central Hall, under the direction of Sir Michael Costa, at which Mesdames Christine Nilsson and Marie Rose, and Messrs. Edward Lloyd and Maybrick assisted. In addition to some well-chosen vocal selections from *Il Talismano*, the MS. overture to this opera was performed for the first time, and elicited marks of genuine enthusiasm.

THERE are rumours of the postponement of the Glasgow Musical Festival, which was to have taken place in November next. Prof. Macfarren had completed a new cantata, composed expressly for this event, and entitled the *Lady of the Lake*.

THE preparations for the Birmingham Triennial Musical Festival are far advanced, and the decorations in the Town Hall, said to be of a costly and tasteful character, are nearly completed. In addition

to Prof. Macfarren's new oratorio, the *Resurrection*, referred to by us last week, performances will be given of Wagner's *Holy Supper*, Gade's *Zion* (composed for the occasion), a new cantata by F. H. Cowen, entitled the *Corsair*, and *Elijah*, *St. Paul*, and the *Messiah*. The principal vocalists will be Mdlle. Tiens, Mdlle. Lemmens-Sherington, Mdlle. Albani, Mdlle. Patey, Mdlle. Trebelli Bettini; Mr. Vernon Rigby, Mr. Edward Lloyd, Mr. Santley, Mr. Cecil Tovey, and Signor Foli.

MDME. CHRISTINE NILSSON has offered two prizes, one of 20 gs. and another of 10 gs., to be awarded by the Royal Academy of Music in July next year, to female singers who shall have been students in that institution throughout the whole academical year, and who shall be judged to sing best and second best a song of Handel, and a ballad (to be selected by the committee) suitable respectively for soprano, mezzo-soprano, and contralto voices. Each prize will be presented in a casket bearing the name of Christine Nilsson together with that of the successful competitor.

AFTER assisting at a series of about twelve concerts in the months of August and September at Stockholm and various towns in Sweden, Mdlle. Christine Nilsson will proceed to Belgium and Holland. Later in the autumn arrangements will be made for a tour through the larger towns of Austria, Hungary, and Germany. At Vienna this vocalist will appear at the Hofopertheater in the parts of Ophelia, Mignon, Gretchen, &c.

HERR A. LANGERT, composer of the operas *Des Sünchers Fluch*, *Die Fabier*, and *Dornröschen*, has been appointed by the Duke conductor of the Court Theatre at Coburg.

THROUGH a slip in our Music Notes last week, Mr. Barnett's oratorio *The Raising of Lazarus* was spoken of as "composed for the Hereford Festival." The work is not a new one, having been first produced in London at the fourth concert of the New Philharmonic Society in 1873.

By J. BUCHAN TELFER, F.R.G.S., Commander R.N.

THE CRIMEA AND TRANSCAUCASIA.

With Illustrations and Maps.

Two Volumes, medium 8vo, cloth, price 36s.

NARRATIVE OF A JOURNEY IN THE TAURIC RANGE AND IN THE KOUBAN, GOURIA, GEORGIA, ARMENIA, OSSETY, IMERITIA, LETCHGOUM, SWAN-NETTY, AND MINGRELLA.

Captain Telfer's book is not only a record of his own personal experiences, but will also serve as a guide-book to the interesting regions, hitherto so little known, into which he penetrated.

THE GRAPHIC says:—

"To the future visitor to a land of travel not as yet overdone by bookmakers we could not easily commend a better guide than these two honest unpretending volumes."

HENRY S. KING & Co., London.

Now ready, Two Vols. demy 8vo, price 30s.

AN ANALYSIS OF RELIGIOUS BELIEF. BY VISCOUNT AMBERLEY.

"YE SHALL KNOW THE TRUTH, AND THE TRUTH SHALL MAKE YOU FREE."

EXTRACT FROM LADY RUSSELL'S PREFACE.

"Let them (the readers) remember that while he assails much which they reckon unassailable, he does so in what to him is the cause of goodness, nobleness, love, truth, and of the mental progress of mankind."

NOTICES OF THE PRESS.

"He has bequeathed to the world a collection of interesting facts for others to make use of. It is a museum of antiquities, relics, and curiosities. All the religions of the world are here jostling one another in picturesque confusion, like the figures in a masquerade."—*Times*.

"This work has more than one claim on the reader's attention. Its intrinsic interest is considerable. We close these volumes with a sense of real regret that one born to a position of so much influence as their author, and likely, on the whole, to have used it for such high and pure aims, should have been taken from among us."—*Spectator*.

"There is real pathos in the passages in which the writer, smarting under the bitter sense of a recent bereavement, the influences of which hastened in all probability his own early death, speaks of the separations of the tomb, and manifestly despairs of a state of being in which such separations shall take place no more."—*World*.

"Its intrinsic qualities will secure it a wide audience, and though the more exacting reader may not find all he had hoped from the nature of the topic, and from the character and qualifications of the author, no one will fail during its perusal to be deeply interested, and what is more, to be powerfully stimulated to independent thought."—*Examiner*.

"Lord Amberley has brought together a large amount of curious and interesting information concerning the religious customs of barbarous nations."—*Nonconformist*.

LITERATURE.

LORD ALTHORP.

Memoir of John Charles, Viscount Althorp, third Earl Spencer. By the late Sir Denis Le Marchant, Bart. (London: R. Bentley & Son, 1876.)

THE subject of this very interesting book fills a singular place among British statesmen. The late Lord Althorp—we use the name which was a household word in 1831–2—had not the gift of superior genius; he was not one of those master-minds which perceive and direct the march of events, and leave a permanent stamp on the fate of Empires. He was not even a man of great acquirements, one of those whose learning and thought improve the sphere of government and legislation; and he had no claim to the fascinating art which charms or subdues by the mere spell of eloquence. As a politician he for the most part followed in the footsteps of more original leaders; as a public speaker he gave little proof of mastery of political knowledge, while his diction was somewhat halting and rude, and his manner uncourtly and even awkward; and his appearance was that of a plain country gentleman, without those graces of person or bearing which occasionally make up for the defects of an orator. Yet this unpretending and homely personage was for years a trusted, nay, a beloved, chief of one of our great Parliamentary parties, at a crisis of the very gravest moment; in this position he powerfully aided in carrying through the most important change our polity has known since 1688; and experience showed that the very existence of a Ministry which seemed of irresistible strength, even in the spring-tide of its popular favour, depended upon his continuance in it. It would, indeed, be difficult to point out a public man who, even in the age of Peel and Wellington, possessed the solid and widespread influence which fell to the share of Lord Althorp. In successive Parliaments which hung on the lips of Canning and Brougham, of Macaulay and Stanley, his unadorned and unlettered speech commanded profound and instant attention. During the great and perilous struggles for Reform his name was a tower of strength to his triumphant followers, nay, a beacon of hope for his defeated foes; and his authority was second only to that of Lord Grey in the agitated and almost distracted country. No politician of the day, in fact, was so generally esteemed by all parties, at a time when such a sentiment was a peculiar honour; and from 1831 to 1834, it was felt in the

Cabinet and at Court alike that his presence in the Government, at the post he held, was an absolute condition of its power and safety. How such a man could have attained such eminence in the England of forty-five years ago is an interesting if not a perplexing question; and the problem will be found fully solved in the valuable and instructive work before us. We have, indeed, seldom read a better biography; and, though the long experience of its accomplished author in our Parliamentary life and traditions caused us to expect a great deal from him, our expectations have been amply fulfilled. Here and there, no doubt, the late Sir Denis Le Marchant has dealt too much in minute details; and occasionally he has enlarged at excessive length on occurrences which rather belong to history and its general domain than to his special subject. But he has given us a portrait of Lord Althorp at once life-like, correct, and striking; he has delineated with considerable skill the character of the man and the statesman; he has fully brought out the high qualities through which one who was at first sneered at as a “mere Chairman of Quarter Sessions” won greatness and renown in the State, in an age rich in distinguished men; he has commented ably, on the whole, and well, on the politics and events of the time. Few books of the class, we repeat, deserve more ample and unqualified praise.

Lord Althorp was the eldest son of the second Lord Spencer, and was born in 1782. The first years of the boy were somewhat neglected, his father, a chief of the Whig Secession, being almost wholly immersed in politics, and his mother being a great London lady; and to this, perhaps, we may partly ascribe the shyness of his manner in after life. At Harrow he was not remarkable for book-learning; yet there was something in him that attracted notice, and he made many friends through the mingled sweetness and strength of a very straightforward character. His career at Cambridge was very much the same: he was at once popular and respected; but he showed that he had excellent parts, for, though he was not a reading man, he contrived by hard study for a few months to come out first on the lists of Trinity. In 1804 he entered the House of Commons, a nominal supporter of Mr. Pitt; and two years afterwards, through Lord Spencer's interest, he was appointed a Junior Lord of the Treasury in the celebrated administration of “All the Talents.” On the fall of that short-lived Government he found it necessary to take distinctly a side in politics; and his choice was made with the ready decision which was a marked feature of his downright nature. Though brought up a Tory in the Tory camp—his father, as is well known, was head of the Admiralty at the most critical time of the great war with France—he had always inclined to Whig principles; and, when Mr. Perceval came into office, he threw in his lot finally with the Opposition. From this time forward he was an active member of the Liberal following in all its fortunes, adhering rather to its Radical wing than to its orthodox Whig centre; and with Whitbread, Romilly, Burdett, and others, he gradually

worked his way to distinction. His maiden speech was made on the resignation of the Duke of York in 1809; and it is significant of the high estimate that had been already formed of his tact and discretion, and, at the same time, of his independent character, that Whitbread selected him as the spokesman of his party on a most difficult matter, and that, in his sturdy resistance to the Court he separated himself from Lord Spencer. It is impossible to describe in detail the Parliamentary conduct of Lord Althorp during the long reign of the Liverpool Government. He condemned the coercive measures of Castlereagh; spoke out boldly on the affair of Peterloo, and advocated—at least, in principle—the Reform of Parliament, Catholic Emancipation, and the Nonconformist Claims. He distinguished himself, however, chiefly upon economic and social questions: he read deeply on these matters, and his views were enlightened and well defined; and he was probably the first of the Whig nobles who sincerely upheld the cause of Free Trade and thought ill of the Corn Law of 1815. He displayed, also, no common skill in finance, and in subjects connected with it; and, with an intelligence certainly in advance of the time, he proposed more than one of the schemes of Legal Reform which happily have become since law. In this way, though in no sense an orator, he became a man of mark in the House of Commons; although what, perhaps, stood him most in stead, was the reputation he soon acquired for high honour, conscientious probity, and soundness of judgment seldom equalled. His conduct in the business of Queen Caroline showed how he excelled in this last respect: he refused to join in the mere party-cry that exalted her into an injured heroine.

Before the break-up of the Liverpool Cabinet Lord Althorp had become a chief of the Opposition; and even at this time he had more authority than men of much greater natural powers. This was, doubtless, in part due to his birth and connexions, but it ought to be mainly ascribed to himself; the Russells and Cavendishes, who sat with him, were equally of the patrician order, but even Lord John had little of his weight and influence. It was characteristic of his keen sense of honour that he disapproved of the advances of the Whigs to Canning; like most of the public men of the day, he had, rightly or wrongly, a fixed conviction that the brilliant Minister was at heart a schemer. He supported, however, Canning in his liberal policy, and he identified himself, in a special manner, with Huskisson in his Free Trade tendencies. Lord Althorp—characteristically here again—found it less difficult to entertain the notion of a coalition with the Wellington Ministry: he appreciated the simplicity and strong sense of duty of the soldier-statesman not unlike his own; and he strenuously upheld the Tory chiefs, against their mutinous and angry followers, in their settlement of the Catholic question. The famous declaration of the Duke, however, against any change in our Parliamentary system, put an end to this brief political truce; and when the long era of Tory Government was brought, in November, 1830, to a close, and

Lord Grey had formed his great Ministry, Lord Althorp was made Leader of the House of Commons, with the office of Chancellor of the Exchequer besides. Parliamentary Reform was now the question of the time; and it is a remarkable proof of the general esteem in which Lord Althorp was already held, that Lord Grey had wished to place him at the head of what was to be a Reform Government, though the subject had been for many years the special care of the veteran statesman. Lord Althorp's services in the protracted contest which resulted in the success of the Bill determined his place among British statesmen. As he was an indifferent speaker, the task of bringing the great measure before the House of Commons, as is well known, devolved on Lord John Russell; nor can it be said that in the debates on the question his speeches ever rose to the height of eloquence. But he was prominent in the Cabinet in preparing the scheme; here his clear head, his command of facts, and his fine discernment, were of priceless value; and, though he was not one of the Committee of Four which finally put the Bill into shape, he was not the less one of its chief authors. It was his attitude, however, in the House of Commons, and the manner in which he conducted the measure through the long ordeal of 1831-2, that raised him to the peculiar eminence he attained at the Reform crisis. As a debater he displayed consummate judgment in answering objections and explaining details; he showed himself ready at all points, immense as was the range of the subject; and even on technical legal questions he was no unequal match for Scarlett and Sugden. Yet what was most striking in him as a party leader, and what most contributed to his immense success, was his perfect tact and mature sagacity, and, added to this, the art he possessed in conciliating even the fiercest opponents, and, above all, the impression he made on every one that his good faith and rectitude were conspicuous even among English gentlemen. "It was Lord Althorp's fine temper that carried the Bill," was the half-vexed admission of Sir Henry Hardinge; "Lord Althorp had only to get up, take off his hat, and shake his head, to satisfy the House," exclaimed Sir Robert Peel; "There was something quite delightful to me," said Jeffrey, "in that calm, clumsy, courageous, immutable probity and well-meaning, and it seemed to have a charm with everybody."

Conciliatory, however, as Lord Althorp was, he was not less determined that the Bill should be a really effective and popular measure. He was singularly skilful in defeating attempts to weaken it by indirect means; and he steadily resisted, and with complete success, pleas for delay, enquiry, and devices of the kind. In the Cabinet he opposed all compromise incompatible with the original scheme; and he was foremost in urging a bold policy on more than one halting and timid colleague. In the various crises through which the Bill passed he was always for going fearlessly on; he was for the Dissolution after the Gascoigne motion; he had little faith in the plans of the Waverers; and, though he had the strongest objections to the creation of peers for the

mere purpose of "swamping the Tory lords," he insisted, under a threat of resigning, that recourse should be had to this expedient, should the fate of Reform depend upon it. As his admirable management of the House of Commons made him trusted by all in that assembly, so the knowledge that he had set his heart on Reform secured him the confidence of the masses; and it was fortunate for the nation, at this conjuncture, that, in Lord Althorp, as in Lord Grey and in others, it possessed men whose exalted qualities made them its moderators in a great popular movement. As we have said, the place of Lord Althorp in history was fixed by his conduct at this period; but we may briefly glance at the part he played, in other respects, in the Grey Ministry. His first budget was not successful, nor can it be said that he was such a master of finance as Sir R. Peel or Mr. Gladstone; but the general views he expressed were far-sighted, and his ablest successors have, in the main, followed the financial policy of which he sketched the outlines. He gave earnest and valuable aid in carrying out many of the great measures which still form the pride of the Reform Government; and his industry and power of grasping details were conspicuous in the debates on the Poor Law, on Tithes, and on the Emancipation of the Blacks. He was more liberal than any of his colleagues in the Cabinet on the Irish Question; and, though he scarcely perceived the full extent and danger of the numerous ills of Ireland, he instinctively felt that the Irish difficulty was not to be removed by mere coercion, nor by commonplace and superficial remedies. As is well known, it was an Irish subject that virtually brought his career to a close, and that broke up the far-famed Ministry which had triumphed in 1831-2, and still seemed at the very height of fortune. An indiscretion of the late Lord Hatherton placed Lord Althorp in what he conceived to be a false position with respect to O'Connell; he insisted, accordingly, on resigning; and, as Lord Grey declared that he would not attempt to carry on the Government without his colleague, his administration suddenly came to an end. This event disclosed the imposing weight of Lord Althorp in the national Councils: the Liberal party in the House of Commons treated him to return to his post, and he reluctantly consented, Lord Grey's successor having assured him that his refusal would be of the greatest injury to the Liberal cause. The occurrences that followed again showed what Lord Althorp was, at this time, to his party. The death of his father in 1834 having removed him to the House of Lords, the King made this the excuse for dismissing the whole Melbourne Cabinet at a moment's notice; and the step was justified by the Tory leaders on the sole ground that the Whig Government could not go on with a chance of success in the absence of Lord Althorp from the House of Commons. This event finally took Lord Althorp out of the arena of party politics. Extraordinary as his success had been, he had never loved the life of a public man; office had proved an intolerable burden to him; and it was with heartfelt joy that he caught an opportunity to free himself from its troubles and

cares. His life was prolonged for eleven years; and though once or twice he joined in the great party conflicts of 1841-2, and, even as late as 1844, his name was spoken of as a possible Premier, he devoted almost the whole of his time to improving his large but incumbered estates; to country pursuits, in which he excelled; and to scientific and religious studies, for which he had a peculiar turn. He passed quietly away in 1845, revered and lamented by troops of friends, and mourned by the still numerous band of statesmen who had participated in his toils and his triumphs. Few public men of the last generation are so justly entitled to the proud name of an English worthy in the best sense of the word.

WILLIAM O'CONNOR MORRIS.

Angling Idylls. By G. Christopher Davies. (London: Chapman & Hall, 1876.)

IT is impossible to deal censoriously with sketches such as those under notice. The term *Idylls* has been very appropriately applied to them. They are poems in prose, replete with rural and pastoral images of an engaging order. Without being pretentious, there is a dash of freshness about them which borders, now and then, upon originality, accompanied by a brilliancy of setting not often found in compositions of the same class. With floral life, as it is exhibited in the area selected by him, the author displays great intimacy. His descriptive powers, when brought to bear upon it, show force and character, and at the same time are divested of the pedantry in which the naturalist too often indulges. Familiar plants, as a rule, are presented before the reader clad in their familiar names, which, to my mind, are more purpose-like and intelligible than those derived from Latin or Greek sources. As an angling guide or an instructor in the art of capturing fresh-water fishes, the volume before me is, comparatively speaking, valueless. Mr. Davies, I feel assured, puts forward no claim in this direction. The range occupied by him is not an extensive one, nor are the finny subjects of it such as the ambitious angler of the modern day careth to encroel. Very tame in comparison with the rivers and lochs which form a component part of the Scottish uplands are the brooks, meres, moats, and ditches in which Mr. Davies has dipped line; and a very different kind of sport is that of dealing with roach, bream, and pike from a tussle with the *ferox* or the lordly salmon. But the enthusiasm which can draw such intense pleasure from a contracted sphere of action and the minor pursuit, giving, moreover, eloquent expression to it, as the author has done, is everything.

In the small space allotted in this volume to trout-fishing, the Stewart or "all-round tackle" is alluded to and set forth as "better than any other." I have been a practical angler for more than half a century, and lived on the most eligible portion of Tweedside for forty years. During that long period, worm-fishing in clear water, in the months of June and July, has been my study and delight, and the conclusion I have arrived at is in favour, out and out, of the single-hook tackle. By it, in clear, still

stretches of a river, or from a lake, on the brightest of days, large trout may be taken; whereas the three-hooked tackle recommended by the late Mr. Stewart will be found quite inefficacious. In streamy water, also, under corresponding circumstances, the single hook, with the shank bent back a little, I have found to be more trustworthy than the other. Complex tackle generally (I feel qualified to pronounce on the matter through long experience) will be discovered to be in the long run a delusion and a snare to the angler, and only exceptionally so to the objects of his pursuit. In fishing with the minnow, for salmon, trout, and pike, I rarely bring into play more than two hooks—the lip and shaft wires, and find them to do good duty. Triangles or flights of wires are contrivances which in salmon-fishing should be put a stop to and the use of them declared illegal. They are in the way of victimising annually thousands of kelts, and do not insure sport a bit better than the two-hooked minnow tackle.

Reverting to Mr. Davies' volume, I find that it abounds in quotations from our favourite poets. They are hackneyed ones admittedly, and as such recognisable in regard to their sources. But is it, I ask the question, justifiable and in accordance with usage to introduce them into the text of a book, as if they were part and parcel of it and formed original matter of the author's own coining? This has been done here to a large extent: possibly, the publisher is to blame, possibly the printer; but the doing of the deed is patent, and open to challenge. What might Charles Reade not do, were the like liberty taken with his sensational effusions; and what the upshot in a court of law?

One little matter more—not exactly in the fault-finding line, but approaching it. In p. 26 an incident is introduced the spirit of which, as regards the author's part, is scarcely in accordance with the Scriptural precept, "Let not thy left hand know what thy right hand doeth." The embowelling of a half-crown in the belly of a roach, on the chance of its being discovered by the intended recipients, it strikes me, is rather an eccentric and unsatisfactory way of almsgiving. I should like to be informed whether that half-crown ever reached its destination; and so possibly may the well-intending donor.

The day and generation of the contemplative man with his float and angle of which this volume gives assurance are not yet passed away, notwithstanding the prevailing mania for sport with the rod of a more exciting order. We highly recommend Mr. Christopher Davies' production as pleasant reading—its discursive element being rather a merit than a blemish.

THOMAS TOD STODDART.

ISLAM IN THE NINETEENTH CENTURY.

Der Islam im XIXten Jahrhundert. Von H. Vámbéry. (Leipzig: Brockhaus, 1875.)

THE title of this book is a little misleading. It would have been more accurate to call it "Turkish Islam in the Nineteenth Century;" for, though Herr Vámbéry intro-

duces some information about Persia and other parts of the Mohammadan East, his experience seems to have been mostly among Turks, and the strength of his work lies in those portions which relate to Turkey.

The volume is arranged in the form of a series of fifteen essays, under the headings of "Culture," "Innovations," "The State, its Head and its Dignitaries," "The Family and the Individual," "Schools, Education, Literature," "Industry and Trade," "The Great Powers of Europe and Mohammadan States," "Islam and Christianity," "East and West," &c. Most of these are suggestive, and written with much vigour; a few, however, are carelessly put together, and are not altogether free from the diffuseness which is a not uncommon failing in works in the German language, and one or two seem introduced not for the importance of the subject or the novelty of the treatment, but rather for the sake of completeness, not to say "padding."

In this series of essays we have a picture by an eyewitness of the present state of Turkey, political, social, intellectual, commercial, religious: and a desperate picture it is. Herr Vámbéry seems to have a taste for painting in dark colours, but in this instance it is to be feared that he has scarcely exaggerated the evils he describes. The facts are too well-known to admit of much misrepresentation, and they hardly leave room for exaggeration. The Turkish empire was in a sufficiently miserable plight before it began to ape the customs of Europe, but the skin-deep reforms which have been the result of the Europeanising mania have had anything but a salutary effect, and it may truly be said that the latter state of French-varnished Constantinople is worse than the first. The young Easterns who have been sent to the capitals of Europe to be "civilised" have succeeded only in carrying off European vices and hats. The junior members of the Turkish Civil Service who have been subjected to the improved "liberal education" have only arrived at an acquaintance with the French *demi-monde* and the first chapter of *Télémaque*, while they are as far removed as ever from the energy and despatch which they were intended to learn from the West. The two essays on European innovations are, perhaps, the best written and most striking in the volume, and certainly the state of things they describe does not give us cause to rejoice in the good influence our civilisation has as yet exercised on Turkish affairs.

We confess to having entertained some apprehension that Herr Vámbéry, after giving us his gloomy view of the present condition of the Mohammadan East, was going to lay the blame of the whole upon the devoted head of the Prophet of Islam; and we were considerably relieved to find that he traced the evils to quite another source. In his chapter on "Islam and Christianity" he expresses his opinion that the Christians of the East are, to say the least of it, quite as indolent, bigoted, and degraded as the Muslims. He finds the root of the evil, not in any form of religion (though he seems to entertain the most unmitigated contempt for every form of

dogmatic belief), but in the physical constitution and the natural surroundings of the Eastern. That this is the true explanation most people acquainted with the subject will, we think, admit.

Everyone will naturally ask what Herr Vámbéry thinks about the future of the East. As a traveller of considerable experience, his opinion is worth something; and it is satisfactory to find that in the face of the discouraging details he has collected, in spite of the constitutional and ineradicable disabilities of the Eastern as compared with the Western, notwithstanding the hitherto-unfortunate effects of European innovations, he yet has hopes for the East. He believes the present anarchic state of Turkey to be the necessary consequence of the introduction of the elements of change among people of a peculiar temperament; and he does not think the evils of a time of transition can be taken as evidence of the ultimate effect of European culture on the East. He sees in a small minority of farsighted Turkish and Persian statesmen the elements of future improvement. He looks neither to the politics of the "young Turkish party" nor yet to the religion of the Wahhábis for the regeneration of the East, but to that very civilisation and culture of Europe which has already had so much influence, though of a superficial and even a deteriorating character, upon Turkey.

"Western influence will bring about a gradual improvement in this dreary state of things, but the progress will of necessity be exceedingly slow; and although much will be changed in the old world, that spirit and life will never thoroughly be naturalised in it which physical and ethnic conditions have brought to pass in the West, and which for that reason are proper to the West alone."—"Die Dinge in Asien gehen langsam, sehr langsam vorwärts, aber sie *gehen*, und die Hauptsache ist, einer Besserung entgegen."

STANLEY LANE POOLE.

Under the Northern Lights. By J. A. MacGahan. With Illustrations by G. R. De Wilde. (London: Sampson Low & Co., 1876.)

OF the making of Arctic books there seems no end, but of the much study which is a weariness to the flesh there is scarcely a trace. Most of the productions which the expedition in the *Alert* and *Discovery* have brought to life might be characterised in the Stud-Book of literature as "Sire, Scissors, out of Dam, Paste-Pot." They are, with a few exceptions, mere compilations of a very inferior description. It is, therefore, refreshing in the wilderness of *réchauffé* print to meet with a book that has some pretensions to tell the author's own experiences, however scant they may be. Mr. MacGahan must be known to a wide circle of readers as the adventurous American correspondent who reached Khiva and wrote such an admirable account of his adventures. In his short voyage with Captain Allen Young in the *Pandora* last summer he had neither so novel nor so wide a field for the exercise of his descriptive powers. He has, notwithstanding, supplied us in a short compass with a well-written book which, if it contains nothing new, tells the

old tale in a graphic manner and with fewer blunders than usually disfigure the hasty sketches of unscientific tourists. The main features of Captain Young's voyage have been abundantly described in the journals of the day; and, indeed, there is little in this volume that has not already more than once appeared in the *New York Herald* and other newspapers, and in two other narratives of the expedition in English and Dutch. Of its *personnel* and objects we need say nothing except that the expedition was at the joint expense of the commander, Lieutenant Innes Lillingston, R.N., the late Lady Franklin, and Mr. Gordon Bennett, whose representative Mr. MacGahan was, and that its intention was to search the scene of Sir John Franklin's misfortune anew for papers or other relics, and if possible to pass from the Atlantic to the Pacific. In addition to Captain Young, Lieutenant Lillingston, and Mr. MacGahan, there were on board Lieutenant Pirie, R.N.; Lieutenant Beynen, of the Dutch Navy; Dr. Horner; and Mr. De Wilde, whom, however, Mr. MacGahan is wrong in describing as "the first professional artist, excepting Mr. Bradford, who ever visited the Polar Regions." An inspection of the Danish Art Galleries in London will satisfy him that a greater than either of these two gentlemen not only visited, but resided a whole winter in the Arctic regions. Even then Mr. Rasmussen is not the only artist who has visited Greenland. Captain Young's expedition was absent from England scarcely four months, but during this period it made a remarkably rapid, and, had circumstances been favourable, might have even accomplished a successful, voyage. As it was, the ice barred their way before they could reach within 150 miles of King William's Land. Captain Young, considering that prudence for the safety of those entrusted to his charge would not warrant his wintering, returned home, and a few weeks ago has again started on an attempt to accomplish the same voyage in the *Pandora*. The good wishes of all who admire pluck and perseverance will accompany the gallant yachtsman who won his laurels so long ago under Sir Leopold McClintock in the *Fox* Expedition. Meanwhile, Mr. MacGahan's volume will supply many who interest themselves in the fate of the Arctic Expedition with an account of some of the incidents common to all voyaging in the ice-encumbered seas of the far North. The volume extends to little more than 300 pages, and even that space is not altogether occupied with the narrative of the voyage of which it is ostensibly the record. Two chapters are compiled from the works of Rink and Markham, while several others are clearly "padding." Their connexion with, or their relevancy to, the rest of the volume is not at all clear. The first portion of the voyage, viz., from Cape Farewell to the entrance to Lancaster Sound, takes us over comparatively familiar seas. Davis's Strait and Baffin's Bay have been long the familiar battling-grounds of the whalers; while, beyond the valuable information that one of them fell in love with an Eskimo belle, and several of them got tipsy, Mr. MacGahan has little to relate of the

doings of himself or his companions in "the land of desolation." Dr. Rink's recent volume supplies two of Mr. MacGahan's most interesting chapters; but, as the book in question is not an unknown one, they might have been spared in favour of some account of the ways of life of the Danes and Eskimo in Greenland, which even the hurried visit of the *Pandora* must have afforded materials for. An accurate account of Greenland in the English language is yet one of the desiderata of literature. Even what little the chronicler of the *Pandora* expedition supplies us with is not altogether accurate, though we must say, as a rule, Mr. MacGahan, wisely avoiding what he knows nothing about, does not often err in his scientific details. Where, however, in all Greenland are "the red sandstone mountains" referred to at p. 19? The "great interior glacier" of Greenland (p. 32), it is true, has never been crossed, but it has more than once been partially explored, as Mr. MacGahan might have learned had he taken the trouble to read the "Arctic Papers" of the Royal Geographical Society, which were doubtless on board. This exploration has never extended beyond a few miles from the west coast eastward, but it has enabled us to understand almost as fully as we are likely to do the physical structure of Greenland. Again, "the banks and the adjacent mountains and valleys [of Greenland Fjords] are full of partridges, ptarmigan, reindeer, that are scarcely ever disturbed by the presence of man, and they offer the most delightful hunting-grounds it is possible to imagine." On the contrary, there are no "partridges" whatever in Greenland, and, so far from being "one of the most delightful hunting-grounds it is possible to imagine," it is scarcely possible to conceive of a worse one. Game on land is scarce except in a few spots, and the pursuit of seals and white whales at sea requires the training of an Eskimo before it can yield a very heavy "bag." Reindeer are very local, and in Mid-Greenland are as rarely seen as Polar bears. While attempting to enlighten his readers by clearing up the synonymy of Disco Island, he makes confusion worse confused, and proves that he is no botanist when he describes the rather exuberant flora of the vicinity of Godhavn as consisting of "only a little grass and moss, and a little yellow flower." The description of the coal mines at Kudliset is about equally accurate from a scientific point of view; but as Mr. MacGahan does not pretend to be a "scientist," it would perhaps be ungenerous to gibbet the trifling errors into which he has fallen. At the same time he could easily have avoided them by a reference to the numerous very accessible documents which he ought to have been acquainted with before writing even the most "popular" of narratives. We will not deprive the reader of the pleasure of reading the many amusing passages with which the book abounds regarding the adventures of the party; for, whatever may be the satisfaction with which the gentlemen who have afforded materials for the fun will read the tale of their sayings and doings, there can be no doubt of the amusement which, on the Rochefoucauldian maxim, their misfortunes will afford their friends.

An exuberant amount of humour is the characteristic of the volume. Indeed, this seems to have been the main feature aimed at in writing it. Who was the genius who first considered it necessary to make a volume of travel a collection of broad grins has never yet been discovered. At all events it seems to be a settled conviction that the man who is in London the gravest of his species must, the moment he gets beyond the bills of mortality, burst into an eruption of small jokes, and grin through a literary horse-collar from preface to finis! Mr. De Wilde has given some very good illustrations, and has added to the value of what is altogether a very enjoyable volume. Without wishing to indulge in any comparisons—odious or otherwise—it is not a work of the merit of Mr. Lamont's, which we recently passed under review, but it is infinitely superior to the host of absurd compilations with which the book-market has lately been flooded.

ROBERT BROWN.

The Life of Admiral of the Fleet Sir William Parker, Bart., G.C.B., &c., &c., &c., from 1781 to 1866. By Rear-Admiral Augustus Phillimore. Vol. I. (London: Harrison, 1876.)

IN these days of biographies a Life of Sir W. Parker was inevitable. For, although this distinguished officer, the last of Nelson's captains, was not much known beyond his own profession and immediate neighbourhood in his later years, within those somewhat extensive limits no one was more admired and beloved. It was reasonable also to suppose that a man who, after his death, had found a sufficient number of friends to erect a sumptuous cenotaph in the cathedral of Staffordshire, his native county, and to fill three large windows with stained glass in the church of Shenstone, which he had helped to build, would also leave behind him more than one writer anxious to commemorate his career, and very many sufficiently interested in it to justify the most cautious publisher in printing the narrative.

Indeed, the only wonder is that the book should have been nearly ten years in preparation, and that we have only one volume of it even now; for all the materials were ready at once, being contained in careful journals and numerous letters, which, although rather lengthy, are always to the point and very well worded. Probably this long delay has been caused by the difficulty in discovering, among so many competent candidates, *dignissimum auctorem*. However, the work has fallen at last into hands as competent as they are loving; and Admiral Phillimore, helped as he has been both by the good judgment and the literary taste of the present baronet, may be congratulated upon his success. But nothing except preternatural dulness in the telling could have spoiled the story of a life which had in it many of the best elements of a romance. This will be seen from the following sketch.

The son of a Chief Baron of the Exchequer and brother-in-law of him who, known already among the tars of England as the Jack *par excellence*, was soon to win his earldom at Cape St. Vincent, Mr. George Parker, of Alington Hall, thought that he

inflicted no dishonour on a pedigree dating, as we learn, from the reign of Edward I., when he entered his third son, William, as a sailor-servant to Captain Duckworth of the *Orion*. At twelve years of age the boy was a middy, and his gallant behaviour with Lord Howe on the glorious 1st of June, in 1794, made Sir John Jervis so happy that he tipped his nephew three guineas. By August 2 he had received ten pounds for prize money, and twenty pounds more was due to him. After this he not only never drew any money from his parents, but persuaded them in the course of time to accept very substantial presents. Before the close of 1794 he was through navigation the second time, and first in the school. On this occasion he expressed that determination to be first in everything which was probably made long before, and which certainly was never relinquished. At fifteen he was acting-lieutenant in the *Magicienne*, an old gunner being put into his watch until it was seen that Mr. Parker made no mistakes. This provisional appointment, together with all others which followed rapidly, was confirmed; in which respect Admiral Phillimore's hero had better fortune than his friend Sir C. Adam, who once found himself, without any sin of his own, reduced from the rank of an acting-captain to that of an actual midddy. At eighteen W. Parker commanded the *Volage*, and in the following year he gained 2,000*l.* By this time his uncle, in command of the Channel Fleet, signed himself St. Vincent, and thus, without much chance of refusal, could ask Lord H. Seymour to post the commander of the *Volage*, who had already been promoted to the *Stork*. This enabled him at twenty-four, when commanding the *Amazon*, to secure in one day nearly 30,000*l.* On the strength of this and other less brilliant strokes of fortune, he at twenty-nine married one who not only possessed a pedigree as illustrious as his own, and a spirit as frank and loveable, but who was also pronounced, by no mean judge, to be the handsomest woman of her day.

Of the courtship Admiral Phillimore gives no account; and perhaps he never heard how the negro servant, who had witnessed the wooing in the groves of Teddesley, saved the lovers the trouble of announcing an engagement which led to more than fifty-six years of happiness.

But the story of the great windfall is given, although not quite in full, and it is well worth repeating here. In return for much good service done by the *Amazon*, including a vigilant watching of the Toulon Fleet and an abundant supply of live stock from Cape Palma, Lord Nelson resolved to give the smartest frigate in the service a chance of making some money. To do this, however, was difficult; for his own cruising ground had been swept clean, and Sir John Orde, a superior officer, and a bitter enemy both to himself and to Lord St. Vincent, lay in the Bay of Cadiz (from which, by the by, he was hunted by Villeneuve), and attached to his fleet all the ships which came within his reach. Under these circumstances the following proceedings occurred, which read strangely. Lord Nelson gave Captain Parker orders, in his own handwriting, but

unsigned, to go to Lisbon with despatches, and he added, *vivâ voce*, that if he could not elude the vigilance of that fellow, meaning thereby Sir John, he would not believe that he, Captain Parker, had a drop of Jervis blood in his veins. Accordingly, Captain Parker ran the Orde blockade. But he could only do this by taking advantage of the darkness, and with the connivance of Captain Hoste, who commanded the look-out frigate for Sir John, and who actually overhauled the *Amazon*. But a conference between the two captains in the cabin left an impression on the mind of Hoste that he had better let his Nelsonian comrade go free. Captain Parker sailed at once, and disregarding the signals for recall, which, being striped flags at the masthead, were gravely noted in the log as proving that the fleet, which had been regarded as Russian, was really Spanish, he arrived at Lisbon. There, having put the despatches on board the packet, happily met with, and resisting all applications to enter the harbour (which, as the *Lively*, an Ordian frigate, was there, would have been suicidal), he looked out for plunder. The result is given on p. 266:—

"The chase showed Spanish colours. She was overtaken and boarded. The officer returned, hardly able to articulate for excitement.

"She is the *Gravina*, sir, of 6 guns."

"Well, what is her cargo?"

"Oh, sir, she has hides and indigo."

"That is capital;" but seeing the lieutenant still much excited, "anything else?"

"Yes, sir, cochineal."

"Still better. What is the matter? Any more?"

"She has three hundred and thirty thousand dollars in hard coin besides."

To this account Admiral Phillimore might have added two particulars: the first as an example of Sir W. Parker's habitual prudence; and the latter as a solitary instance on his part of hazardous impetuosity. The first point is that the captain of the *Amazon* allowed no gun to go off, lest other ships might appear on the horizon to share with him; and the second, that in distributing the prize money with the strictest justice, he dispensed with some of the usual formalities. This enabled him to carry a draft for 10,000*l.* to his chief; and the rapidity with which the business was transacted offers a pleasing contrast to the delays in settling the *Magicienne* account, which was not made up until 1826! Enough has been written to show that the book under review is very interesting, and every one who reads it, especially that part which relates to the doings of the *Warspite* in Greek waters, will look forward to the second volume, which it is to be hoped will contain a photograph.

R. W. ESSINGTON.

History of the Reformation in Europe in the Time of Calvin. By the Rev. J. H. Merle D'Aubigné, D.D. Translated by William L. R. Cates. Vol. VII. Geneva; Denmark, Sweden, Norway; Hungary, Poland, Bohemia; the Netherlands. (London: Longmans & Co., 1876.)

THERE is no necessity for our repeating here the general estimate of the powers of M. Merle D'Aubigné which we expressed when reviewing his preceding volume (see

ACADEMY, June 5, 1875). The excellences and defects of that volume appear, as might be expected, in the present, and we cannot add to our charges against the author the accusation of inconsistency, or of having violated Horace's rule—

"Servetur ad imum
Qualis ab incepto processerit."

The only difference we observe in the present publication is that there is somewhat less of original research, and perhaps a little more display of bias towards Calvin and the Reformers, with whose cause he seems entirely to identify his own opinions. M. Duchemin in his preface admits and attempts to justify the prejudices of the author in favour of his hero, and it must be admitted that he would have produced a far less interesting work if he had been wholly devoid of such prejudices. It was M. D'Aubigné's boast that he had lived with the men of the sixteenth century; that he was better acquainted with them than anyone else; that, in fact, he was a man of their time; but neither he nor his French editor, nor again his English translator, could appreciate the force of Prof. Ranke's caustic reply, "That explains everything. I could not believe when reading your books that you were a man of the nineteenth century." The fact is, an unprejudiced writer is sure to make a dull history, and, whatever be the faults of M. D'Aubigné, dullness is not one of them.

And now we proceed to give some account of this, which it seems to be the penultimate volume of the series; and we regret that we are at present unable to fulfil the promise of our last article, by giving some account of the career of the great Genevese Reformer after his recall from his temporary exile from his adopted city. The portion of the volume which refers to Calvin and Geneva occupies scarcely 150 pages, and runs over a period of time little exceeding eighteen months. We must reserve what we have to say of Calvin and his author's estimate of him for another time, and shall probably recur to the subject after the publication of the eighth and last volume of the *History of the Reformation in Europe in the Time of Calvin*. Meanwhile it seems just worth while to draw the reader's attention to chapter xxiii., which gives some account of some of the sermons which Calvin preached after his restoration to his office at Geneva. It is interesting as showing how Calvinism has been modified by the followers of Calvin in the nineteenth century, and also as proving how impossible it is in practical discourses to carry out, or even so much as to imply without reservation, the peculiar tenets which are usually associated with his name. In fact, M. D'Aubigné labours to show that Calvin was not, after all, so very Calvinistic as some of his followers, and in practical exhortations could make use of expressions which sound very contradictory to the utterances of his *Institutes of Theology*. That Calvin's sermons, which are between two and three thousand in number, are comparatively poor and unequal in vigour to his other works is admitted by his most ardent admirers—and the extracts given from some of them by our author certainly fall in with this view—and

the vindication of his practicalness in preaching cannot be sustained without interfering with his reputation for consistency. The phrases, "The Gospel is offered to all;" "It is God's will that we should all be saved;" "Christ came not to reconcile a small number of people to God, but to extend his grace to the whole world," contain doctrine which to common sense is true and intelligible, and at the same time is theologically correct; but neither is there any attempt made by M. D'Aubigné, nor is it in the nature of things possible, to reconcile such expressions with the doctrines of absolute election and reprobation which are usually associated with the name of Calvin. As regards the distinctive tenets of Calvinism, M. D'Aubigné observes that Calvin cautioned his hearers against perplexing and perilous inquisitiveness into the doctrine of predestination, while as regards Calvin's own opinions he is content to say that he is not sure that Calvin did not allow himself to be drawn a step too far into the labyrinth.

The principal part of this volume, however, is concerned with the Reformation among the Scandinavian nations, Hungary and the Netherlands. And here we have no attempt at research. The history consists merely of an abridged and very concise account of the changes of religion in the sixteenth century in those countries, taken from printed sources, without any attempt to enter into minute details. Nevertheless, this part of the work will not be without its interest for English readers, for, in point of fact, we know of no English book which traverses the ground occupied by this volume. The references are almost wholly to works printed either in Latin or in German, so that, though there is nothing absolutely new, the greater part of the history appears new because it is in an English dress. What is most striking in the progress of the Reformation is the mode in which Protestantism propagated itself everywhere through a principle which appeared to take hold of the minds of men as soon as ever the Scriptures were translated and disseminated in the vernacular tongue. There is no point which more forcibly illustrates the miserable state of the Church as regards the faith and conduct of its clergy than the ease with which the yoke was thrown off, and everything was disbelieved which readers of Scripture could not prove for themselves from the Bible. It was with the aid of this principle that Zwinglianism developed so fast in the cantons of Switzerland, and Luther's doctrine spread from Germany to the Northern nations. The abolition of the compulsory celibacy of the clergy is the best illustration of the position we are maintaining. It was the absence of anything definite on this subject in the pages of the New Testament which afforded the pretext for objection to the restriction; but it is impossible that the change of practice in this respect should have commended itself so generally if there had not been very widely-spread and extensively-appreciated evils that had sprung from the lax lives of the clergy. Neither, again, could the absence of any definite distinctions between bishops and priests in Scripture have led to so

fierce an opposition to the Episcopate if it had not been backed by the political and worldly lives prevalent among the hierarchy of the Church.

The account of the spread of Protestantism among the Danes, Swedes, and Norwegians given in this volume will tend to undeceive such writers of the English Church as have attempted to represent the Reformers, whether foreign or English, as being willing or anxious to preserve the Episcopate if they could. That the Episcopal form of government was retained in England must be regarded as a fortunate accident or a Providential interference, just as people may be respectively inclined to regard the occurrences of that eventful period of Church history. That it ceased to exist in other Reformed Churches in Europe must be attributed to the desire to get rid of it, and not to circumstances which necessitated it. No regard for it as a divine institution can be found, as far as we know, in any of the writings of the Reformers, English or Continental, with the exception of the single passage in the preface to the Ordinal published by Edward VI. in 1549, and which was continued in 1552. If there is any such we should be extremely glad to see it produced. Unquestionably, Melancthon, the most moderate of all the Reformers, in a work which appeared in an English translation as early as 1543, taught that ministers were chosen by the people, and that the difference between a bishop and another pastor was made by man's authority only.*

These two points—the getting rid of the enforced celibacy of the clergy, and the dispensing altogether with the order of bishops—seem specially prominent in the Reformation in Denmark. The suppression of the celibacy of the clergy even preceded Luther's first declaration on the subject by four years. And just about the time when the Lutheran formula was presented at Augsburg, Tausen and the Danish Reformers presented to King Frederick I. their Confession of Faith. What is most remarkable about this Confession is that at so early a period it was so far in advance of the Lutheran formula.

The *Confessio Hafniensis*, following somewhat in the track of the Augsburg Confession, begins with the sufficiency of Holy Scripture, proceeds to lay down the doctrine of the Trinity and Incarnation, and adopts a vague phraseology about the Church, implying a congregation of righteous and well-beloved sons of God. It then asserts the lawfulness of marriage for all estates of men, and protests against any earthly head of the Church as an interference with the sole sovereignty of Jesus Christ.

In the articles on the Mass and the Priesthood it is remarkably in advance of the Protestantism of the day. That on the Mass is pure Zwinglianism, and that on the Priesthood pure Congregationalism, if we may use a term which involves somewhat of an anachronism. On the former head it says:—

"We believe that the true Christian Mass is nothing else than the commemoration of the

* See *A New Work concerning Both Parts of the Sacrament*. . . . by Philip Melancthon . . . Signat e₁₁₁.

passion and death of Jesus Christ, the celebration of the love of God the Father, in which the body of Christ is eaten and his blood drunk as a sure pledge that for Christ's sake we have obtained the remission of sins" (p. 214).

On the subject of the Christian ministry it is equally explicit:—

"We believe that we all, as Christians, are priests in Christ Jesus, our only and eternal High Priest; and that as such we are to offer ourselves to God as living and acceptable sacrifices to preach and to pray. But among these priests some must be chosen, with the consent of the Church, who may preach to the Church, may administer the sacraments, and serve it. These are the true bishops or presbyters, words which are completely synonymous" (p. 215).

We need scarcely say that our author entirely subscribes to all this. To use his own words:—

"Such was the faith of the evangelical Christians of Scandinavia. This Confession is a mirror which reflects their likeness feature for feature. We are better acquainted with them after reading it, and we see in them true disciples of the Gospel" (p. 216).

In the concluding part of the volume we have a brief sketch of the rise and progress of the Reformation—first, in Hungary; secondly, in Bohemia; and, lastly, in the Netherlands. There is very little original research in this part of the volume. We gather, however, from two slight allusions to the mad Queen of Castile, the mother of the Emperor, that M. D'Aubigné has heard of the discoveries of the late M. Bergenroth among the Simancas papers. Perhaps the editor of this posthumous volume was not bound to save our author from the ridiculous mistake of following in M. Bergenroth's wake and endorsing his view that the supposed Protestantism of Queen Juana had anything to do with her long confinement. It is due, however, to M. D'Aubigné to state that he does not repeat the story which M. Bergenroth extracted from the Emperor's desire to give his mother more liberty, and which, by a mistranslation of two Spanish words, he construed into an order to inflict corporal punishment upon her. As regards Hungary, the principal point made by the author consists in the protection afforded by the Turks to the Protestant party as against persecution on the part of Rome, and he scarcely enables his reader to judge how far the Lutheran principle was over-ridden by the Zwinglian or Calvinistic idea. The short account which begins with the sixth chapter of this thirteenth book might have been expected to be more interesting, because it brings before our notice the name of one who played a most important part in the history of the English changes of religion under Edward VI.—the Polish nobleman, John A'Lasco. But the author, in attempting the History of the Reformation in Poland, has given us nothing but a meagre life of him, from 1524 to 1546, and we are left to wonder how the remainder of the life of A'Lasco, the rest of the history of the Reformation in Bohemia, Poland, and the Netherlands, are to be crammed into the same volume, which has yet to give us the important details of the nearly twenty remaining years of the life of Calvin.

The last few pages of the volume are occupied with what the author is pleased to

call the History of the Reformation in the Netherlands; but in reality they contain little beyond an account of some of the trials for heresy which were going on between 1525 and 1544. The important point of the spread of the Anabaptists at this time is scarcely alluded to. We should have expected some expression of opinion upon a subject which has afforded so much matter of triumph to Catholic writers, who look upon it as the natural consequence of Lutheranism, and concerning which the Protestant party have found such difficulty in distinguishing the line which separates liberty from licence in the private interpretation of Scripture. NICHOLAS POCKOCK.

The Indian Song of Songs. By Edwin Arnold, M.A., formerly Principal of the Poona College, and Fellow of the University of Bombay. (London: Trübner & Co., 1875.)

YEAR by year have the songs of Jayadeva been chanted in the moonlight under the palm trees of India, as the anniversary of the poet has come round. Many generations have passed away, but his glowing verses have lost none of their charm; the crowds have been always changing, but they have always been full of wonder and delight. When the literature of India attracted the attention of scholars from the West, the *Gitagovinda* was among Indian poems one of the first to be studied and admired*: but all the translations, the best of which are those of Jones and Rückert, adhere too closely to the letter of the original to be able to catch its spirit, and it has been reserved to Mr. Arnold to give us such a version as can convey to the European reader an adequate idea of the beauty of Jayadeva's verse.

The opening of the poem, which is divided into twelve cantos, represents Krishna, the Indian Apollo, forgetful of Rādhā his heavenly bride, and fascinated with the love of the shepherdesses of Vraja: and then, while

"Beautiful Rādhā, jasmine-bosomed Rādhā" waits for her too forgetful lover, one of her maidens sings a song of which the first verse runs:—

"I know where Krishna tarries in these early days of spring,
When every wind from warm Malay brings fragrance on its wing,
Brings fragrance stolen far away from thickets of the clove,
In jungles where the bees hum, and the koil flutes her love—
He dances with the dancers of a merry morrice one,
All in the budding spring-time, when 'tis hard to live alone."

But in the midst of his merriment something touches a chord in his heart

* Nearly three-quarters of a century ago, Sir William Jones translated Jayadeva's masterpiece for the *Asiatic Researches*; and in Germany Dr. Fr. Maier and F. H. von Dalberg each published a translation in prose in 1802, A. W. Riemschneider another in 1818, and F. Rückert one in verse in 1837 for the first volume of Ewald and Lassen's *Zeitschrift für die Kunde des Morgenlandes*. The best edition of the text is that published in 1834 by Professor Lassen of Bonn, with an exact Latin translation. The version into English by Colonel Ouvry under the name of *Satyam jayati* is not made from the original.

and awakens the thought of his beloved, as when a traveller who had wandered far from his native land suddenly hears

"The bird of home, the koil,
With nest notes rich and clear;
And there should come one moment
A blessed fleeting dream
Of the bees among the mangoes
Beside his native stream!
So flashed a sudden yearning,
The sense of a dearer thing,
The love—the lack—of Rādhā,
Upon his soul in spring."

Then her maiden sings to Rādhā another song describing Krishna passing the idle hours away with the Vraja shepherdesses—"wholly passion-laden; eye, ear, sense, soul o'ercome. Krishna is theirs in the forest; and his heart forgets its home!"

In the next canto Rādhā pours out her sorrow and her love; and at last sends her maiden to her lover to tell him that though angry she is still forgiving.

Meanwhile the faint memory which arose in Krishna's mind has made bitter the cup of forbidden joy which he was drinking.

"My feet with the dancers are weary,
The music has dropt from the song,
There is no more delight in the lute-strings,
Sweet shadows! say! what has gone wrong?
The wings of the wind have left fanning
The palms of the glade;
They are dead; and the blossoms seem dying,
In the place where we played.
We will play no more, beautiful shadows,
A fancy came solemn and sad,
More sweet, with unspeakable longings,
Than the best of the pleasures we had."

Oh! whisper of wonderful pity!
Oh! fair face that shone!
Though thou be a vision, Divinest;
This vision is done."

And then—"as one who welcomes to her throne a new-made queen, and brings her enemies before it, bound—so Krishna in his heart throned Rādhā," and roaming through the forest disconsolately, seeks her again. He meets not her but the maiden she had sent, who tells him how she longs for his return, and how though far from him, "her soul comes here beside him and sitteth down with his."

In the fifth canto the maiden returning tells her mistress that Krishna longs as anxiously as she for reconciliation, and urges her to go and meet and welcome him:—

"Mistress sweet, and bright, and holy,
Meet him in that place,
Change his cheerless melancholy
Into joy and grace.
If thou hast forgiven, vex not,
If thou lovest, go,
Watching ever by the river
Krishna listens low!
Listens low, and on his reed there
Softly sounds thy name,
Making even mute things plead there
For his hope:—'tis shame,
That while winds are welcome to him
If from thee they blow,
Mournful ever by the river
Krishna waits thee so!"

But Rādhā is too weak with waiting and with sorrow to go to meet him, so the maiden returns to him and sings:—

"Krishna! 'tis thou must come (she sang),
Ever she waits thee in heavenly bower.
The lotus seeks not the wandering bee,
The bee must find the flower."

Her steps would fail if she tried to come,
Would falter and fail, with yearning weak,
At the first of the road they would falter and pause,
And the way is strange to seek.

Ten times lost in a languorous swoon,
'Now he cometh—he cometh,' she cries;
And a love-look lights in the gloom,
And the darkness is sweet with her sighs."

While Rādhā waits for the return of her messenger her "quick thoughts take shape in a fine jealousy":—

"O moon! (she sang) thou art so pure and pale,
Is Krishna wan like thee with lonely waiting,
O lamp of love! art thou the lovers' friend,
And wilt not bring him, my long pain abating?"

In vain, in vain!
Earth will of earth! I mourn more than I blame,
If he had known, he would not sit and paint
The tilka on her smooth black brow, nor claim
Quick kisses from her yielded lips—false, faint,—
False, fragrant, fatal! Krishna's quest is o'er
By Jumna's shore.

Vain—it was vain!
The temptress was too near, the heaven too far;
I can but weep the while he sits and ties
Garlands of fire flowers for her braided hair,
And in its silken shadow veils his eyes
And buries his fond face. Yet I forgive
By Jumna's wave!

But when the weary night had worn away
In these vain fears, and the clear morning came,
Lo, Krishna! lo! the longed-for of her soul
Came too! In the glad light he came, and bent
His knees and clasped his hands; on his dumb lips
Fear, wonder, joy, passion, and reverence
Strove for the trembling words: and Rādhā knew
Joy won for him and her; yet none the less
A little time she chided him."

But the maiden again intercedes for him; and then, seeing her half relenting, Krishna himself bursts out in the tenth canto into a song of repentance and love:—

"O angel of my hope! O my heart's home!
My fear is lost in love, my love in fear:
This bids me trust my burning wish, and come,
That checks me with its memories, drawing near.
Lift up thy look, and let the thing it saith
End fear with grace, or darken love to death;
Or only speak once more, for tho' thou slay me
Thy heavenly mouth must move, and I shall hear
Dulcet delights of perfect music sway me
Again—again that voice so blest and dear.
Sweet judge! the prisoner prayeth for his doom,
That he may hear his fate divinely come."

So if thou'rt angry, still this shall avail,
Look straight at me, and let thy bright glance wound me,

Fetter me! grieve me! lock me in the jail
Of thy delicious arms: make fast around me
The silk soft manacles of wrists and hands—
Then kill me! I shall never break those bands."

Rādhā yields, and the next canto gives us the reconciliation song, after which her maidens conduct Rādhā to the bridal-bower, singing as they go: and in the last canto, which Mr. Arnold has not translated, follow the songs of Rādhā and Krishna to one another, rejoicing in the rapture of their recovered love; the feeling that they had lost it for a time only adding fuel to the fire of their passion.

The charm of these beautiful love-songs lies not only in the wealth of imagery by which all nature is made to pay homage to and bear witness of the power of love; and not only in the beauty and variety of the many melodious metres which make the *Gitagovinda* a masterpiece of versification; it lies very much also in the fact that the

love described is a very warm and very human love, the history of which could not fail to excite in men's minds the sweetest memories or the sweetest hopes. It is somewhat strange, therefore, to be told that these songs are not meant to kindle earthly love at all, but to convey a high religious lesson of contemplation and of self-control. It is clear, however, from the few stanzas scattered through the poem in which the author speaks in his own person, that he means his verses to be taken in this sense; and we may remember that Christian theologians have found a holy mystery in Solomon's love songs, which are not to be compared for poetical beauty to those of Jayadeva; and that the discussion is not yet ended as to the inner meaning which underlies the plain sense of Dante. Mystics of different times and countries have found in the nuptial contract a fit emblem of religious love, and have not hesitated to work out the figure into detail, and in language certainly drawn from earthly love not of the platonic kind; and so far have the Sûfis of Persia carried this method of religious diction that to understand the hidden sense of their effusions dictionaries have been composed (like those of the language of flowers), explaining *sleep* by meditation on the divine perfection; *perfume* by hope of divine mercy; *kisses* by the raptures of piety; *tresses* by the expansion of the divine glory; *down on the cheek* by the world of spirits who encircle his throne; a *black mole* by the centre point of the universe, and so on to a wearisome extent.

Similarly the instructed reader is to understand by Krishna the human soul, by the shepherdesses the allurements of sense, and by Râdhâ the knowledge of, or meditation on divine things. The author himself sings:—

"Mark this song of Jayadev:
Deep as pearl in ocean wave,
Lurketh in its lines a wonder,
Which the wise alone will ponder;
Tho' it seemeth of the earth,
Heavenly is the music's birth. . . .

Ah! human creatures!
Even your phantasies are teachers!
Mighty love makes sweet in seeming
Even Krishna's woodland dreaming;
Mighty love sways all alike
From self to selflessness." . . .

The human soul in the spring-time of its life may drink deep draughts of earthly joys, but will find them all hollow and unreal; and even in the full tide of its rapture a lack of something higher—a yearning—remains, which can only be satisfied by true allegiance to the Divine Wisdom, so lovely, and also so forgiving and so kind. The parallel may be traced much further, especially if one allows oneself a little inconsistency; regarding Râdhâ now in one light, now in another: but it should be noticed that Jayadeva makes Râdhâ's beauty differ from that of the shepherdesses in degree, not in kind; her fascinations are all of the body, not of the soul; and it is probable that the warm human love of the songs has contributed more to their popularity than the mystic meaning that lurks beneath it. Not that the double sense has been without its charm, or that the songs have lost in power through their delicate aroma of mys-

tery for the ignorant, of philosophy for the student, and of religion for the devout.

Of the poetical style of the translation the reader can judge by the passages quoted above: in our judgment it deserves to take rank with Griffith's beautiful version of the Râmâyana; and, though the translations of Sir William Jones and of Prof. Lassen will be more useful to the student, for the general reader it is the best yet published, and is not likely to be soon surpassed.

T. W. RHYS DAVIDS.

NEW NOVELS.

'*Verts, or the Three Creeds*. In Three Volumes. By Dr. Maurice Davies. (London: Tinsley Brothers, 1876.)

Eunice. By Mrs. Julius Pollock. In Two Volumes. (London: Tinsley Brothers, 1876.)

As Long as She Lived. By F. W. Robinson, Author of "Grandmother's Money," &c. In Three Volumes. (London: Hurst & Blackett, 1876.)

Blotted Out. By Annie Thomas (Mrs. Pender Cudlip). In Three Volumes. (London: Chapman & Hall, 1876.)

What Old Father Thames Said. By Coutts Nelson. In Three Volumes. (London: Samuel Tinsley, 1876.)

THE theological novel is the most depressing production of the age, and the depressing effect of '*Verts*' is in no degree mitigated by the murder, suicide, and search for lost property recorded in it. The conclusion of the whole matter to be drawn from it is that to those who have no particular opinions of their own Roman Catholicism is a pleasant change for a few months, and it is quite easy, if a man's wife does not like him to be a Roman Catholic, for him to change again and get a living in the Church of England at once. Alec Lund, the hero of '*Verts*', is about the most wearisome person we have met in fiction for some time, and the reader could find it in his heart to wish that when this tiresome young man was so near being hanged in the second volume he had not been rescued by the discovery of the true culprit. Elsie, his vulgar and unpleasant wife, was too sensible to have married such a foolish person in real life; even the murderer, the Rev. Percy Llewellyn, would have been less of a bore in the domestic circle, for he seems to have had a gift for silence, while Alec Lund drones on about his opinions for many pages at a time until we feel that if his wife had not been gifted with supernatural patience there would probably have been two murders to eke out this tedious book. '*Verts*' is a sort of theological slang expression used to avoid the necessity of saying convert or pervert, and it is considered funny to speak of "Archibald of Canterbury." The book might have been pardoned if it had been only dull, but it is at the same time unpardonably vulgar, and its plot and style are offensive. If Dr. Davies is anxious to ventilate his opinions on Church matters, it is to be hoped that he will for the future choose some other mode of doing so than the three-volume novel.

Eunice is a doleful story of a young tutor

who falls in love with the sister of his pupil and goes out to a far country to make a fortune which will enable him to marry her. He is supposed to be drowned, and returns to find her married to his uncle. A man is called an "unhappy fish," and "gnashes his splendid ivories;" we also read that "dawn pelted the slumberers with the soft roses of heaven unheeded," and people seem to talk more foolishly to each other than is the custom in real life; but possibly readers will be found who tolerate even the sentimentality of Harold and Eunice.

Mr. F. W. Robinson has apparently taken money as his special subject. He views it from every aspect. He digs it up, he buries it, he burns it, he wills it, he leaves it first to this person and then to that, and puts into his stories what everyone thinks about it, *ad nauseam*. In *As Long as She Lived* he has thirty thousand pounds to play with, and he first kills an old man with the sudden mention of it, and then seems to play a game of ball with the money, tossing it from one person to another till a good deal of it melts away in the process. The opening scene of the book among the old pensioners of St. Lazarus' Charity is picturesque, but the story which follows is confused in style and is dependent for its interest on sensationalism. The hero, Brian Halfday, is not a pleasant man; his drunken father comes to him in difficulties, and he looks at him "more sadly than sternly," and says, "You sit before me, a riddle hard to guess at, and the past sheds no light upon you"—and he displays the same priggishness to the end of the book. But there is little or no variety in the characters. It would be impossible at any time to guess who is speaking from what is said. Brian speaks like Marian Westbrook, and she speaks like his father and his sister Dorcas, while Angelo Salmon, who is meant to be the fool of the story, talks exactly like all the rest of the people in it. The sensational ending of the attempt to poison Brian is highly unnatural, and Michael had certainly no right to go free and unpunished when he had proved himself such a dangerous member of society. Angelo Salmon also gets off his attempt to murder Brian in a wholly unaccountable way. We conclude that such a sentence as "Dorcas was more completely prostrated, *mental and bodily*, than her brother" is a misprint.

Blotted Out is the story of an unselfish girl who is foolish enough to die of a broken heart for the sake of a thoroughly selfish man. Mrs. Pender Cudlip draws a dreary picture of life if she means us to believe that there are many such slight and silly girls as the sisters Claire and Tim, who can blindly worship such a despicable specimen of mankind as Theo Bligh, for the sake of "his greenish hazel eyes" and his capacity for getting money out of them. The writer apologises for a story which has been written in the midst of domestic trouble of no ordinary kind; and we can but feel sorry that she felt it necessary to publish it, but, as it is the third volume for which special apology is made, we may be allowed to notice in the first volume that one of the characters, Mr. Murray, on p. 90, is said

to be the most classical of English writers, a purist in style; and on p. 225 we find him telling the woman he is going to marry that "she makes him very happy, she is so jolly ignorant;" and again on p. 227 that "often the temptation to have a peg instead of writing a leader is too strong for him." Is this "classical English," or did Mr. Murray reserve that only for his writing? Tim's story is pathetic, and her character has some fine touches in it, but she deserved a better fate.

What Old Father Thames Said has one decided claim to originality, and this consists in its grammar. On p. 1 we find that "every visitor to London is sure to hear tell of Chancery Lane;" at one of the last pages we have, "nothing more was ever heard tell of them;" and in the great gulf between this beginning and end there is an infinite variety of choice expressions of the same kind. People are said to have "taed;" to be "colder," instead of having a cold. When a baronet dies, we read, "Not another word escaped his lips. And no wonder. *He was dead.* . . . the second Baronetcy had ceased to be." "Riches taketh to themselves wings and fleeth away." Even the refrain which Father Thames sings contains questionable grammar. If after the quotations already given, curiosity is still felt about the plot, it may be as well to mention that there are two stolen heirs, and two good properties, in addition to the usual crowd of wicked attorneys, rich villains, thieves and detectives, who all live on the happiest terms with each other until their interests happen to clash. F. M. OWEN.

CURRENT LITERATURE.

England, Palestine, Egypt, and India, connected by a Railway System. Popularly Explained with Map. By S. McBean. (W. H. Allen and Co.) This small volume discusses no new project. It advocates a line of railway from London to Bombay, which, exclusive of the Bosphorus and English Channel, would be 8,129 miles in length; and to traverse which from end to end would take the ordinary traveller eight days and thirteen hours, or the express traveller six days and ten hours, instead of the twenty-four days now requisite to accomplish the misnamed "Overland" Route via Brindisi and Suez. We have no wish to ridicule or to throw cold water on so stupendous, or, to use a recently popularised expression, so truly "grandiose" a proposal. Far from it; we have full faith in the feasibility and eventual realisation of a Turko-Persian railway line to India. But the speculating public will assuredly want details of a different kind from those here given, before drawing a conclusion upon merits. The author falls into the errors of his energetic predecessors, who have been writing up the Euphrates Valley line for the last twenty years. He deals too much in generalities; talks more of politics and philanthropy than of the practical part of his scheme; and contemplates results when he should be guiding his reader, step by step, along his chosen track. Granted that he has found the proper way to Baghdad, we doubt whether in keeping the sea-coast from below Basrah to Karáchi he indicates the fittest continuation of the route. His reasons in this respect may be gathered from the following extract:—

"From Bussorah to the entrance of the Persian Gulf a great many rivers have to be crossed in Persian territory, and a large outlay on this head is required over a distance of 800 miles. From the Persian boundary to Kurrachee, through the Beloochistan

coast, there are comparatively easy works, with few rivers of any importance. The works being along the Persian Gulf and Indian Ocean from Bussorah to Kurrachee, a distance of 1,753 miles, or more than one half of the entire length, renders the construction of the line a very simple matter so far as transport is concerned, because the plant and materials required can be landed at every port along the coast in proper quantity where required; and the works might be carried on over the whole length at the same time, if necessary."

This argument is valid so far as it goes. But it is perhaps the only valid one in favour of these inhospitable shores. On the other hand, what would be the views of the Shah and his Ministers on the subject? To insure the sympathy and support of the Persian Government, we must naturally do something to develop the internal traffic of the country as well as secure our own desired communications. Could we not, for instance, instead of going south of Baghdad, seek the most practicable of the Kurdistan defiles, and pass eastward, if not by Shuster or Shiraz, then by Hamadán and Ispahan (perhaps, too, Yazd and Karmán), reaching the sea first at Bandar Abbas or Jask? Nor is the climate on the sea-level by any means agreeable or refreshing at all times. What the writer is pleased to call the "healthy influence of the cool sea-breeze" on the coast of Persia and Baluchistan may be described with equal exactitude as "the scorching blast of the local simoom." During the long hot weather of the Persian Gulf, healthy climatic influences should rather be sought on the higher lands of the interior. But the *brochure* is wanting in essential information. Tables of distances are interesting and useful; but many other statistics than map measurements, and the cost or revenues of Indian railways, are imperatively required for the solution of a question such as this. We believe that Government would do a wise thing in encouraging by every legitimate means, whether in the form of moral support or of tangible guarantee, the construction of a through line of railway from Constantinople to Baghdad. And, during the construction of that line by a private company, the Indian authorities might, with advantage, carry a line westward along the Makrán coast, from Karáchi to Jask, or for 700 miles with the telegraph poles—to shorten the distance of the sea-voyage, and in anticipation of a future meeting of the rails.

A Chronological and Historical Chart of India; showing, at One View, all the principal Nations, Governments, and Empires which have existed in that Country from the Earliest Times to the Suppression of the Great Mutiny, A.D. 1858, with the Date of each Historical Event according to the various Eras used in India. By Arthur Allen Durntall, of the High Court of Justice in England. (W. H. Allen and Co.) This chart has its undoubted uses, and may be recommended for the lecture-room or library; but we cannot endorse the statement that by it "any person may readily obtain a clear view of the broad lines of Indian History, and of the revolutions which have resulted in the dominion of her Majesty as Empress of India." Let a pupil take, for instance, the line for A.D. 1838. He begins in the pale-blue column with the words "Besieged by Persia (Sir E. Pottinger)," and naturally asks to whom or what allusion is made. Looking up the column he finds, after some trouble, that "Herat" is intended; but he also discovers that Kámrán is, three times, mis-spelt "Kamram" and that "Khán" is converted into the less Oriental name of "Kahn." He is, moreover, left in uncertainty why Eldred Pottinger is confined in brackets and called "Sir E." Following the line through some forty-four columns and many colours, from left to right, he learns at length the lesson that the siege of Herat occurred the year after the annexation of Coorg and burning of the London Houses of Parliament, one year before the burning of our Royal Exchange, and two years before the intro-

duction of our Penny Postage. Now as Herat was really first invested by Muhammad Shah in November, 1837, and the siege was raised in September, 1838, it would perhaps have been better to record the latter fact for the year noted. But in almost every respect the table is rather suited to practised heads than to the comprehension of beginners. Reference to its data should be made cautiously and with a certain amount of previous knowledge.

Our Indian Empire: the History of the Wonderful Rise of British Supremacy in Hindustan. By the Rev. Samuel Norwood, B.A., Head Master of the Royal Grammar School, Whalley. (Samuel Tinsley.) The declared aim of the author in publishing this volume is to impart to his fellow countrymen more knowledge than they usually possess on the subject of England's dominions in India, and the history of their acquisition. The late journey of the Prince of Wales had, moreover, its effect in inducing him to write a series of articles in the columns of a provincial newspaper, some of which are reproduced in the book under notice. Ten chapters of small 8vo and large print, forming an aggregate of 346 pages, do not afford much room for prolixity; and the fact that more than half the subject-matter, exclusive of the Introductory Chapter on early history, is devoted to Clive and Hastings shows that the author has allowed himself little space indeed to generalise. Surely nothing can be briefer in its way than the one page of original description of events commencing from the Birmese War in 1826 up to Lord Ellenborough's recall in 1844: but Mr. Norwood labours under serious misapprehension, and may convey very mistaken notions to his pupils, if he considers the battle of Miáni to represent a "signal revenge taken upon the Afghans" (p. 246). Miáni was fought by Sir Charles Napier with the Amirs of Sind, who were Talpur Baluchis; and, though these may have been suspected of hostility to the British during the Afghan War, such conduct was independent of any retribution exacted from the Afghan chiefs of Kabul for our disasters in Afghanistan. Though we cannot give it a very hearty welcome as a contribution to the stores of the reading public, the volume may doubtless be found useful and instructive to many. Its style is better than might be feared from the specimen on the second page, where there is a somewhat complex, single-sentenced paragraph of nearly eighteen lines, calculated to discourage the votaries of the terse, vigorous and essentially clear school of composition.

Visits to the Indian Empire debated by India in Council; also why the Council approved of the Title of "Empress." A Narrative in Rhyme by Viator. (John B. Day.)

"Joy in the city of great Juganáh!
Joy in the seven-headed idol's shrine!"

sang Robert Southey more than half a century ago; and those who at the present hour care to know the India of British poesy would do well to revert to that Laureate's grand exposition of the *dramatis personae* of Hindú mythology. But we doubt whether a new bard, blest even with the genius of the poet-biographer, could make the subject popular to the reading public of 1876; and if, in place of the bold varying strains of the "Curse of Keháma," he were to use the didactic unchanging measures of the "Rape of the Lock" or "Dunciad," his heroes would assuredly have but a short life, and scarcely a happy one. It will be seen, therefore, that the poem under review, commencing

"Excitement on Mount Meru! thither stray,
Muse! for the Gods hold council there to-day,"

does not, to our thinking, illustrate a successful conception. As regards execution, we take a quotation from the postscript headed, "India in Council on the Royal Titles Bill," which will,

perhaps, give a fair specimen of the style and matter of the whole brochure:—

"Queen to be Empress at a nation's will,
Empress of Ind, tho' Queen of England still !'
Now mused the councillors, in wisdom's school,
Brought up in all the elements of rule—
'Why not?' thought they: 'for surely now's the time
Title of Empress, in their northern clime,
To give to rulers of the Indian land,
After the welcome from heart, lip, and hand,
To Albert Edward, whose grand visit here
Will ease the Hindu mind for many a year.'"

The italics commence at a point where Loyalty runs clean away from Letters.

In India. Sketches of Indian Life and Travel from Letters and Journals. By Mrs. Murray Mitchell. (T. Nelson and Co.) A small but welcome contribution to the descriptive literature of modern India, introduced by the writer's husband, the Rev. J. Murray Mitchell, LL.D., in a short preface rendering account of editorship. This gentleman is known and respected in the East not only as an energetic and eminent missionary, but as a scholar of superior attainments. He was an early member of the Senate and Faculty of Arts of the Bombay University, and one of the instructors of the Free General Assembly's Institution affiliated thereto, under the superintendence of the learned convener, Dr. John Wilson, whose death has been so recently lamented. As might be expected, he appears frequently among the prominent characters of Mrs. Mitchell's book; and, however mysterious to the general reader may be the several *dramatis personae* under the guise of capital initials, we can seldom be mistaken in the identity of Dr. M. The prevailing tone of these Indian sketches is that of the zealous missionary—cheerful and contented in surrounding realities; earnest and hopeful in things unseen and spiritual. But there is life and talent exhibited in the portrayal of everyday objects, animate and inanimate; and the writer has both pleasant and instructive secular matter to jot down at Calcutta, Benares, Delhi, and other places. Not the least interesting chapter in the volume is that headed the "Durga Pūja," in which occurs the following passage:—

"There is considerably over a million of the youth of this country now receiving a liberal English education, but an entirely secular one, except in so far as the missionaries can counteract this state of things. All this education, if not intermixed with the leaven of religion, will assuredly work harm; and non-religion, infidelity, and immorality will come in like a flood. Already some of the most respectable and far-seeing of the Hindus are themselves afraid of this; and if things do not mend, the last state of this great country may be worse than the first. The cure, however, seems plain enough: all education should be mingled with moral and religious truth, so that spiritual training may keep pace with intellectual. A good, pure, healthy literature is also much wanted, full of sound principles, and conveying the same moral and religious lessons as the school-books, and at the same time as entertaining and attractive as possible."

A quotation follows from the *Indian Mirror*, said to be "the organ of the progressive section of the Brahmo-Somaj." It gives strong testimony to the higher morality of English missionary education, when contrasted with the teaching of Government schools. All we can reply to this is that, if such be the case, it is so by no law of necessity. Christian morality may and should be inculcated in Government schools, though the Bible and religion be no part of the daily teaching. The simplest solution of the difficulty seems to foreshadow itself in the consideration of what would be the result were Englishmen in India to supply by example in their own lives the missing element of spiritual education. Such illustration could involve no forbidden procedure; for all action would be regulated by charity, and charity neither admits of gratuitous offence nor rejects

kindly tact in dealings between man and man. Mrs. Mitchell's record of Behari Lal Singh's estimate of the late Sir Donald Macleod (p. 274) is a great help to our argument. The highly intelligent author of *Gorinda Samanta* is reputed to have thus expressed himself:—"It was the pious example of this gentleman—his integrity, his honesty, his disinterestedness, and his active benevolence—that made me think Christianity was something living. . . . This was the turning-point in my religious history, which led to my conversion."

Famines in India: their Causes and Possible Prevention. Being the Cambridge University Le Bas Prize Essay, 1875. By A. Lukyn Williams, B.A. (Henry S. King and Co.) This volume is worthy of serious attention. Written in a scholarly as well as practical spirit, it deals with the great question of Indian famines by demonstration of causes, facts, and remedies. It abounds with notes and extracts from the best authorities of the day, supporting or suggesting the writer's textual arguments, without in any way invalidating his position as an original thinker. We gather from its pages that famines in India are caused by droughts and floods, to both of which the country is liable, from want of rain as also from excessive rain; that scarcity is not restricted to one article of consumption, for, while the rice districts were affected in 1874, the wheat failed in 1837 and 1861; that mistakes connected with the land tenure—illustrated by exorbitant rates, as recently in Asia Minor, or by assessment for too lengthy periods, as in the case of some of our own revenue settlements—have helped to bring about the dreaded evil; that the native systems of agriculture are not so faulty as represented by many European innovators, though more regard might be had to certain European expedients, such as the use of manure; and that the prevalence of caste, apathy, and fatalism may be held causes of famine, equally with the more natural action of disease and locusts. On the other hand, remedies are to be found in better means of communication, facilitating the distribution of the essentials of subsistence; in increased security of property, and spread of that education which applies knowledge to the occupations and requirements of ordinary life; in intelligent rather than wholesale treatment of irrigation, whether in respect of wells, tanks, or canals; and in providing, so far as practicable, for the increased proportion of population to edible products, by the improvements of cultivation on soil already cultivated and the utilisation or reclamation of additional land. Nothing could well afford a stronger proof of the advantages of railway communications in India than the fact that in no certain case has famine ever extended over the whole Peninsula. We are told (p. 62) of the famine of 1770, in Bengal, that it "was indeed disastrous, but there was abundance of grain in the neighbouring districts both on the south-west and north-west." Reverting to the records of the period, we find no evidence conflicting with that adduced by the author in this respect; but there is a terrible tale told of the avarice and cruelty of our predecessors in the East on the occasion of the crisis under reference. An account of the fatal visitation of 1770 appeared in the *Gentleman's Magazine* shortly after the facts became known in England. If the statement then published be true, certain servants of the East India Company, foreseeing the calamity, had bought up as much rice as they could manage to procure; and such proceeding was made subject of complaint on the part of the natives, especially in Bahár and Parneah. Rice, which had cost the former a rupee for the 120 or 140 *seers*, was sold at 15 *seers* to the rupee, a percentage of profit which enabled the vendors to realise rapid fortunes. The native merchants subsequently lost by fire much of the grain thus dearly purchased, which they had deposited in granaries near Calcutta; and were further prohibited by Government from obtaining larger returns than by resale at 10 *seers*

the rupee. By the force of circumstances, however, the prices rose to 3 *seers* of bad rice the rupee, in the *bazár*, and purchases even at this rate were effected in secret. Mr. Williams does not enter into any detail of remedial measures for the modification or abrogation of existing arrangements of Land Tenure. But he gives an interesting, if brief, exposition of the three systems of settlement—i.e., annual, for a term of years, or in perpetuity—respectively in force for Madras, the North-West and Western India, and part of Audh, Bengal, Bahár, and Orissa. The objection to undue length of tenure appears to us substantially the same as that urged to high rates; because the mischief is not so much in the settlement being obsolete and inapplicable as that it has become burdensome and oppressive. The deductions obtained by Mr. Williams are so sensible, and his arguments have been so well sustained, that we see no reason to dissent from his conclusion that,

"unless some great change occurs in the climate of India, we cannot expect to altogether prevent a natural scarcity of food sometimes taking place. We may make it less likely to happen, and of smaller extent when it does take place, but do away with it altogether we cannot. And yet the effect of this scarcity may be altogether removed. *The prevention of famines is possible.*"

India in 1875-76. The Visit of the Prince of Wales, a Chronicle of His Royal Highness's Journeys in India, Ceylon, Spain, and Portugal. By George Wheeler (of the Inner Temple), Special Correspondent of the "Central News." With Map and Diaries. (Chapman & Hall.) As the record of a "sight-seeing" expedition, for the most part in choice and pleasant company, and as descriptive of the passage through India of a pageant under circumstances which have rendered it historical, this volume may be favourably regarded, and has a certain claim to attention. As a critical survey of British India in 1875 and 1876, its uses are indirect and problematical. Believing it intended to illustrate the former idea, we commend the book to the general reader with one or two remarks suggested by its pages:—1. Sir Mungulduss Nuthobhoy, "decorated with the Star of India," and "president of a society which seeks to impress on Government the rights and grievances of his race," when interviewed by the writer, stated his whole desire to be the contentment of her Majesty's millions of Indian subjects, but "that could not be the case so long as we overworked the officials sent out to govern;" adding, "no sooner did a Civil servant get into a groove of activity and usefulness than he was removed" (p. 45). He might have said, with equal truth, that the last objection applied especially to English officers attached to the native army, and that steam and electricity have not done the mischief so much as wholesale legislation. 2. The beauty and freshness of the English ladies at Madras (p. 174) presents a more satisfactory picture than the mirthless melancholy of the natives (p. 176), and says a good deal for the careful mode of life of our countrywomen in a climate heretofore warranted to "wash out" and blanch the best and healthiest European complexions. This reform, at least, is a subject of sincere congratulation. 3. The late Bishop Milman was a nephew, not, as stated (p. 193), a "brother of the lamented Dean of St. Paul's." And why "readers of mature age" should be said to "have some recollection of a pleasant book published while they were yet young" (p. 15), in reference to the popular *Old Deccan Days*, when the said book only appeared from Mr. Murray's storehouse about eight years ago, we are not able quite to comprehend.

THE Marquis of Huntly has accepted the post of President of the Social Science Congress at Liverpool this year. The list of presidents of sections is now complete.

NOTES AND NEWS.

THE Rev. L. Tyerman, author of *The Life and Times of John Wesley*, has now in the press a biography of George Whitefield. Original letters, pamphlets, and documents, in many instances quite unknown to Whitefield's previous biographers, have come into Mr. Tyerman's possession. The work, which it is expected will be as exhaustive a Life of Whitefield as it is possible to compile, will be published towards the end of the year by Messrs. Hodder and Stoughton.

MISS BETHAM-EDWARDS, who has been spending the last twelve months abroad, is occupied on a new work, *A Year in Western France*, which will embrace three months' travel in Brittany, Anjou, Aunis, La Vendée and Poitou, with descriptions of French town and country life.

THE forthcoming part of the *Transactions* of the Society of Biblical Archaeology (vol. v. part 1) will contain the following papers, together with others of minor interest:—Prof. Sayce on "The Hamathite Inscriptions;" the Rev. W. H. Houghton on "The Assyrian Mammalia;" Dr. Ginsburg on "The Babylonian Codex of Hosea and Joel, dated 916 A.D.;" Dr. Birch on "The Mummy of Nebset (Stafford House);" Mr. Bosanquet on "The Book of Esther;" Mr. Fox Talbot on "The Sixth Izdubar Tablet and the Myth of Bel and the Dragon;" M. Pierides on "Cypriote Palaeography;" the first part of a sketch of a Sabeian Grammar by Capt. W. F. Prideaux; and Mr. Boscawen on "The Tower of Babel." The papers will be illustrated by fourteen plates.

THE Rev. Canon McClatchie, M.A., Secretary of C. M. S. Missions in China, has just published at Shanghai a translation of the Confucian *Yi-King*, or the Classic of Change, with notes and appendix.

On the 3rd inst., Dr. Gustaf Henrik Mellin, a distinguished Swedish man of letters, died at his parsonage of Nordre Wram. He was born in Finland in 1803, and won an early reputation by his excellent historical novels, among which *Sivard Kruses Bröllop* is considered the best. Of his poems, "Hebe" is the most successful. He was also the author of a history of Scandinavia down to the year 1248.

THE eighth annual session of the American Philological Association was concluded on July 20 by a series of papers and discussions on the much-needed reform of our English spelling. The Rev. J. C. Wightman began by proposing to utilise the old long *S* by employing it to denote the palatal sibilant, and Prof. Martin followed with a lament over the composition and spelling of scientific terms. Then Prof. Sawyer expatiated on the numerous and excessive defects of our present alphabet, while Prof. Shearen, in dealing with the subject of "Phonetic Reform," insisted that the only practical means of securing the desirable end was by educating public opinion to the necessity of an improvement upon our system of spelling. Prof. Whitney also read the following report, drawn up by the committee appointed last year to consider the question of a reform in our spelling:—

"1. The true and sole office of alphabetical writing is faithfully and intelligibly to represent spoken speech, so-called 'historical' orthography being a concession to the weakness of prejudice.

"2. The ideal of an alphabet is that every sound should have its own unvarying sign, and every sign its own unvarying sound.

"3. An alphabet intended for use by a vast community need not attempt an exhaustive analysis of the elements of utterance or a representation of the nicest varieties of articulation, though it may well leave room for the unavoidable play of individual and local pronunciation.

"4. An ideal alphabet would seek to adopt for its characters forms which would suggest the sounds signified, and of which the resemblances should, in some measure, represent the similarities of the sounds. But for general practical use there is no advantage in

a system which aims to depict in detail the physical processes of utterance.

"5. No language has ever had, or is likely to have, a perfect alphabet; and in changing and amending the mode of writing of a language already long written regard must necessarily be paid to what is practically possible, quite as much as to what is inherently desirable.

"6. To prepare the way for such a change the first step is to break down, by the combined influence of enlightened scholars and of practical educators, the immense and stubborn prejudice which regards the established modes of spelling almost as constituting the language, and as having a sacred character in themselves, preferable to others. All agitations and all definite proposals of reform are to be welcomed as far as they work in this direction.

"7. An altered orthography will be unavoidably offensive to those who are first called upon to use it, but any sensible and consistent new system will rapidly win the hearty preference of the mass of writers.

"8. The Roman alphabet is so widely and firmly established in use among the leading civilised nations that it cannot be displaced. In adapting it to improved use for English, the efforts of scholars should, therefore, be directed towards its use with uniformity, and in conformity with other nations."

In the animated discussion which followed Mr. S. P. Andrews stated that he was perfecting a system of spelling which would permit the printing of all languages by the present alphabet more successfully than was done by the complicated system of Lepsius, and the committee was instructed to continue its labours during the ensuing year under the presidency of Prof. Marsh. Prof. Marsh was further empowered to confer with the various philological associations of America and England, in order to see what may be done towards removing "that national disgrace and linguistic monstrosity, our present English spelling."

To prevent possible misunderstandings, it may be well to point out that the Bibliography of the Michel Angelo Festival which, through the kindness of Mr. Heath Wilson, and evidently at the cost of very great labour on his part, we were enabled to give in our number of July 15 was obviously intended to include only those popular publications which appeared in Italy, and in most cases in Florence, at the time, and so far it is, we believe, exhaustive. To include French, English, and German publications would have demanded more space than we were able to bestow. The few words of introduction with which the list was prefaced, and for which we ourselves are, of course, responsible, should perhaps have explained this more clearly; and it may be added that Passerini's volume was purposely excluded, as Gotti's and Milanesi's might likewise have been, as in no wise coming under the head of "popular publications."

DENMARK has lost one of the ablest of her younger philologists in Dr. Richard Christensen, who died on the 2nd instant, at the village of Vebaek, in attempting to save the life of a drowning child. He had but lately married the well-known artist, Miss Anthonore Tscherning. His latest labours will be found in the new volume of *Opuscula Latina* printed by the University of Copenhagen, which opens with a monograph by Dr. Christensen on certain points involved in the relation of Athens to the smaller Greek States.

WE are sorry to learn from the Cape of Good Hope that the Library Committee do not see their way towards continuing the salary received by Dr. Bleek as custodian of the Grey collection, and used by him in the prosecution of his invaluable researches into the languages and folklore of Southern Africa. Miss Lloyd has been entrusted with the task of completing that part of his work which was left in the most finished state, and a sum of money has been placed for the purpose on the Government estimates; but her engagement is to terminate in November. It is of the highest importance that Dr. Bleek's studies should be carried on by a competent philo-

logist and the linguistic memorials of the fast-perishing Bushman race be preserved before it is too late; and we hope therefore that means will be found for adequately supplying Dr. Bleek's place. Meanwhile, as we learn from the *Volksblad*, the movement at the Cape for the establishment of a Chair of Comparative Philology there is still going on, and a question put by Mr. Dowling to the Colonial Secretary drew from him an answer by no means discouraging to the project. If the matter is pressed by European philologists it is not improbable that the Colonial Government, if helped by England, may be induced to endow the chair in question. South Africa is at present one of the most hopeful philological fields that exist, and the foundation of a professorship is the best way that offers itself of carrying on Dr. Bleek's labours and providing him with a successor. The philological wealth of the Capetown library has been considerably increased during the past year. The Rev. F. W. Weber has presented a collection of songs, proverbs, and household stories in the Namaqua Hottentot dialect as taken down and translated by himself; and Archdeacon Waters has sent a vocabulary of Eastern Bushman. The Basle Missionary Society has also sent a collection of seventeen publications in the Ashanti and Akra languages; and the Rev. J. G. Christaller three publications in the Gedebo dialect of the Kru language. Some Zulu books have also been added to the library, including articles on "Zulu Philology" and "Zulu Traditions" by Mr. J. Sanderson, which are partly selections from the papers of the late Mr. D. Leslie, and contain explanations of the Zulu names of the moon throughout the year, as well as remarks by the Bishops of Natal and St. John's (Dr. Callaway) on the native custom of *Hlonipa*. New copies of Bushman paintings have further been contributed by Mr. H. C. Schunke, copied by himself in an almost inaccessible cave in the Zwartberg and three other caves in the rocky hills of the Brak river and the Kammanassie mountains. We ought to add that the Library Committee, now elected annually by the subscribers to the public library, wish to deliver up their powers into the hands of the Government, on condition that the library be administered on the same principle as the National Library in the British Museum.

A VIVID picture of ancient life in Alexandria is given by Wachsmuth in the last number of *Im neuen Reich*. The language is oratorical, being, in fact, a speech which he delivered in June last before the University of Göttingen. Still the position of the author will carry with it a guarantee that all his statements have been acquired by faithful research. As regards the library, he has no belief in the current tale that Egyptian, Chaldean, Roman, and Hebrew records and books were there preserved in Greek translations. The philology of the time was content with Greek. The Museum was an institution founded by votaries of science who, forming themselves into a guild, and, like the other guilds of players, singers, &c., having to choose patron deities, chose most naturally the Muses who were the acknowledged representatives of the various sciences. We have lost that simple idea now. Science has gone beyond Divine patronage, and we observe that for the decoration of the new Natural History Museum at South Kensington art has been employed to rival the lower forms of natural life—perhaps with more success and less cost than if figures of the Muses had been ordered from the contractor. The Museum of Alexandria was a place for the student of science. It was not a public institution where all except "children in arms" were freely admitted and allowed to pass out without examination as to what they had learned on their visit. Imagine the staff, say, of the British Museum, stationed in the hall to examine visitors, to weigh them, scientifically speaking, as they go in and come out. We do not say this was done to the students of Alexandria; but it would be a curious

experiment. The mixture of races in Alexandria, their extraordinary success in trade, and their passion for horse-racing, are features which, when described rhetorically, at once suggest a modern comparison.

A TRANSLATION of M. Taine's *Les Origines de la France Contemporaine* has been published by Mr. Durand (Daldy, Isbister and Co.). The translator tells us that the reader "will find certain words spelt in a different mode from that which prevails in England; also words used according to a different standard of expression." He explains that the book has been printed from American stereotype plates. A critical reader would be inclined to remark, not so much on the prevalence of American idioms, as on the prevalence of French idioms. Translation is, however, an exceedingly difficult work, and Mr. Durand may be thanked for placing a book of such interest in the hands of those who want it, in a form which is on the whole so satisfactory.

THE following Parliamentary Papers have lately been published:—Nineteenth Report of the Inspector of Reformatory and Industrial Schools of Great Britain (price 1s. 8d.); Report of Select Committee on Depreciation of Silver (price 3s. 8d.); Statistical Abstract for Colonial and other possessions of the United Kingdom, from 1860 to 1874 (price 7d.); Correspondence between Great Britain, France, Belgium, and Holland, respecting the International Sugar Convention (price 8d.); Report of Select Committee on the Telegraph Department of the Post Office (price 4d.); Reports from H.M.'s Consuls on Manufactures, Commerce, &c., Part IV. (price 2s.); Report of Joint Committee of Lords and Commons on Parliamentary Agency (price 9d.); Appendix to Fifty-Fourth Report of Inspectors-General on the Prisons of Ireland, 1875 (price 2s.); Accounts of the Metropolitan Gas Companies for 1875 (price 4d.); Report on the Analysis of Butter by the Principal of the Chemical Laboratory, Somerset House (price 1d.); Abstract relating to Turnpike Trusts in Scotland (price 3d.); Eleventh detailed Annual Report of the Registrar-General of Marriages, &c., in Ireland (price 10d.); Return of Number of Vessels launched and added to the Navy since 1855, and now building, &c. (price 4d.); Report of Select Committee on Oyster Fisheries (price 3d.); First Annual Report of the Public Works Loan Board, 1876 (price 6d.); Delagoa Bay: Correspondence respecting the Claims of H.M.'s Government, with Maps, &c. (price 8d.); Papers relating to the late Disturbances in Barbadoes (price 2s. 9d.); Forty-Second Report of the Commissioners of National Education in Ireland (price 3d.); Further Papers relating to the improvement of Prison Discipline in the Colonies (price 2s.); Third Annual Report of the Board of Education for Scotland (price 2s. 2d.); Correspondence respecting the Murder of the French and German Consuls at Salonica (price 1s. 6d.); Correspondence respecting the Affairs of Turkey, and the Insurrection in Bosnia and Herzegovina (price 4s. 2d.); The Eighth Report of the Deputy-Keeper of Public Records in Ireland (price 1s. 3d.).

FOREIGN REVIEWS OF ENGLISH BOOKS.

The Editor will be greatly obliged if the Publishers of foreign Journals will send him copies of those numbers which contain Reviews of English Books.

CAMPBELL, Sir G. C. Specimens of Languages of India. *Literarisches Centralblatt*, June 24.
GARDNER, P. Sicilian Studies. *Jenaer Literaturzeitung*, July 1.
PHILLIPS, George. The Doctrine of Addai, the Apostle. (Trübner.) *Literarisches Centralblatt*, July 15.

NOTES OF TRAVEL.

THE fears which were beginning to be entertained for the safety of Mr. Stanley have been happily set at rest by the letters newly received from him by the proprietors of the *Daily Tele-*

graph. The first of these, dated from Mahyiga Island in July last year, with the sketch map of the south-western portion of the Victoria Nyanza, completes the whole outline of the great lake, filling up a blank which was left in Mr. Stanley's former chart. The letters about to be published will have even a more stirring interest for geographers, since they describe the passage across the unknown country between the Victoria and Albert lakes, intersecting the routes of Speke and Grant, and doubtless adding much to confirm M. Gessi's recent description of the second lake. From this region Mr. Stanley went southward towards the Tanganyika, and is supposed to have arrived at the now familiar district of Ujiji only two months ago.

THE exploration of the south coast of New Guinea is being actively carried on by the members of the London Missionary Society. The Rev. J. Macfarlane, one of the discoverers of the Mai-Kassa, or Baxter River, in 1875, in examining the coast in the mission steamer *Ellangowan*, eastward of Yule Island and Port Moresby, during March and April of this year, came upon a native town of not less than 2,000 inhabitants, named Kerepunu, the people of which show a remarkable degree of civilisation, living in well-built houses with carefully-cultivated gardens and cleanly-swept streets. All along the coast between Amazon Bay and China Straits the natives were found to be much more numerous, intelligent, and healthy than in the other regions yet known.

THE Italian expedition to East Africa (referred to in the *ACADEMY*, vol. ix., p. 382), after long and vexatious delays and persecutions at Zeila—due to the hostile conduct of the Egyptian agent and governor, whose instructions from the Khedive as to the reception of the expedition were not conceived in a friendly spirit—at length started on its way towards Shoa, and has been last heard of from the country of the Eesa Somali, where its members had a hospitable reception.

THE *Geographical Magazine* for this month contains a most useful sketch map of the seat of war in Turkey, illustrating the military operations during July. Mr. Ravenstein continues his examination of the census returns of the British Isles, tracing out in several interesting papers the rules which govern migration, chiefly brought about by the attractive power of the large towns, the centres of industry and commerce. A series of sketches of European life in Greenland, written by a Danish lady who was born and passed several years of her married life in these distant settlements, has been begun in this part; the first of them gives an exceedingly pleasant introduction to the every-day life, occupations, society, and amusements of the colony of Godthaab, which, in summer at least, is by no means a land of desolation. A most important letter from the Italian traveller Beccari, dated from Ternate, March 6, which throws an entirely new light upon some of the obscure questions of the ethnology of New Guinea, is sent by Prof. Giglioli, who shows that Beccari has proved the existence in New Guinea of a dwarf negroid people, who may be classed with the Bushmen and Akka of Africa.

THE essays on Servia, Montenegro, Bosnia and Bulgaria, and on the Russians in Servia which recently appeared in the *Pall Mall Gazette* from the pen of Mr. Sutherland Edwards have been gathered together in a pamphlet entitled *The Slavonian Provinces of Turkey; an Historical, Ethnological, and Political Guide to the Questions at Issue in these Lands* (Stanford). From the admirably clear and simple general view which these papers give of the past and present condition of the belligerent States, and the attitude of the outer Powers regarding them, they will be welcomed in their connected form by a great number of readers.

WE have to acknowledge the receipt, from Messrs. Longman, of new editions of several of

Mr. John Ball's Alpine guides, which are so well known to mountaineers and lovers of Switzerland—*The Central Alps, South Tyrol, and East Switzerland*—the minutely-condensed information in each of which has been brought down to the present date.

A *Smaller Practical Guide to the Isle of Wight*, by Henry Irwin Jenkinson (Stanford), will be found very useful by visitors to the "Garden of England." It is very pleasantly written, and shows considerable research into the history and traditions of the island, its accuracy being guaranteed by the assistance given to the author by old residents in the island in revising his manuscript.

IN the lately published Consular Report from Siam, Mr. D. J. Edwards, Interpreter of the Bangkok Consulate, gives a somewhat lengthy account of his journey at the beginning of last year to Chiengmai and other teak-districts of Siam, in the course of which he furnishes a considerable amount of information, geographical and otherwise, respecting the interior of the country. "The northern and north-eastern Laos States of Siam," he says, "are Chiengmai, Lamphoon, Lakhon, Prii, Nan, and Hluang Prabang. Each of these semi-independent States is governed by its own chief, who, having been invested with his authority by the King of Siam, exercises arbitrary power in the State of which he is ruler, unless when controlled by the King at Bangkok. The chief town in each State is defended by a very substantial brick wall. The distance of these provinces from Bangkok being considerable, the presents and gold and silver trees which are sent down to Bangkok as tokens of allegiance or submission have only to be forwarded once in three years. . . . One of the most important of the Laos States is Chiengmai, not only on account of its size, but also from its vicinity to the borders of British Burmah, and the quantity of teak-timber which is obtained in it for the Maulmain market." The town of Chiengmai is walled and of very considerable extent; "though in some places much of the space within the walls is left to bamboo-jungle, the population probably amounts to 15,000 people. The houses are built of wood, and each stands in its own garden of areca or cocoa-palms."

DR. JAMES HENRY.

ON July 14, at Dalkey Lodge, the residence of his brother, this remarkable man closed an active and earnest life of seventy-eight years. His health of body and vigour of mind were unimpaired when a stroke of paralysis three months ago warned him that his labours must soon draw to a close.

Born in Dublin, James Henry was educated at first at a Unitarian school, and then sent to Trinity College. He was distinguished all through his course, was a scholar, and took his degree at the head of his class, with the classical gold medal, in 1818. He then adopted the medical profession, in which he soon attained great eminence and large practice, though his sceptical and independent ways of thinking estranged him from the religious and commonplace practitioners around him. His *Remarks on the Autobiography of Dr. Cheyne*, an exceedingly sarcastic and bitter exposition of the worldly advantages of Christianity, show clearly the nature of his opinions, and the boldness with which he expressed them. He even advanced to the shocking heresy that no doctor's opinion was worth a guinea, and accordingly set the example of charging five-shilling fees, an unheard-of thing in Dublin in that day. Though his sarcastic and trenchant tracts set him at war with the profession, his practice continued to increase, and he had realised some fortune when a large legacy made him completely independent of his ordinary work and induced him to lay aside professional controversies for literary pursuits.

He began (about the year 1848) to travel

through Europe with his wife and only child, and to make researches upon his favourite author—Vergil. This occupation became an absorbing passion with him, and filled up the remainder of his life. After the death of his wife in the Tyrol (where he succeeded in cremating her and carrying off her ashes, which he preserved ever after) he continued to travel with his daughter, whom he brought up after his own heart, who emulated him in all his tastes and opinions, and who learned to assist him thoroughly and ably in his Vergilian studies. It was the habit of this curious pair to wander on foot, without luggage, through all parts of Europe, generally hunting for some ill-collated MS. of Vergil's *Aeneid*, or for some rare edition or commentator. Thus they came to know cities and libraries in a way quite foreign to the present hurrying age; they came to know all the men learned in their favourite subject, and all the librarians of the great libraries; in Florence, in Leghorn, in Dresden, in Heidelberg, in Dublin, these quaint and familiar figures will long be remembered. Seventeen times they crossed the Alps on foot, sometimes in deep snow, and more than once they were obliged to show the money they carried in abundance, before they were received into the inns where they sought shelter from night and rain.

During all these years—a full quarter of a century—they both pursued with unwearied diligence the criticism and exegesis of the text of the *Aeneid*. But a small part of the results has yet seen the light. In his *Twelve Years' Journey through the Aeneid of Vergil* Dr. Henry first disclosed to the world that a great new commentator on Vergil had arisen, and those who will look through Conington's work will see how many of the best and most original notes are ascribed to Henry. He also printed privately (he never would publish anything except a few papers in periodicals) versified accounts of his travels, something like the Roman *saturae* or medleys, and other poems more curious than beautiful—some of them, however, striking enough from their bold outspokenness in religious matters.

Having thoroughly examined every MS. of the *Aeneid* of any value, he returned a few years ago to Dublin, when declining years disposed him to rest from travel, and where the library of Trinity College afforded him a rich supply of early printed books on his subject. Here he spent most of his time, hunting up obscure allusions, seeking new illustrations, and labouring to perfect that exegesis which he held to be the main problem in editing Vergil. For in textual criticism he had become thoroughly conservative: he believed in the pure condition and good preservation of the *Aeneid*, and used to scorn those scholars who emended because they could not understand. He was with difficulty persuaded to contribute some notes on passages to *Hermathena*, from which scholars may infer the magnitude of a commentary carried out on the same scale through the whole twelve books. This commentary is complete, and has been bequeathed, I believe, to the care of Mr. Davies, the well-known editor of the *Agamemnon* and *Choephori*, a thoroughly competent scholar, and an attached friend of the author. The MS. is in such beautifully clear and accurate writing that its publication will not be difficult. A fragment of 176 pages on the first twenty-six lines (*Eneidea*) was printed a few years ago by Dr. Henry, but he could not content himself with either his own work or the work of any known printer, and so preferred the postponement of the remainder till after his death. With all its ability, its originality, its acuteness, I fear this wonderful commentary is on too large a scale, and embraces too wide a range of illustrations and discussions, to find favour with our examination-driven students. It is like the work of a sixteenth-century scholar, of a man who studied and thought and wrote without hurry or care, who loved his subject and scorned the applause of the vulgar crowd. As such, and as the fullest and best exegesis ever attempted of

Vergil, Dr. Henry's commentary cannot fail to take a permanent and unapproachable place.

To his personal friends the memory of the dear old man will stand out no less distinct and indelible. His long white locks and his somewhat fantastic fur dress, which gave him a certain Robinson Crusoe air, were combined with great beauty and vivacity of countenance and a rare geniality and vigour of discourse. There was a curious combination of rudeness and kindness, of truculence and gentleness, of severity and softness in him, which made him different from other men. He was so honestly outspoken about himself that he could hardly be offensive to others, and those who saw his deep and bitter grief ever since his daughter—the support of his age, and the hope of his future fame—was taken from him by sudden death know how keen and thorough were his affections. He never ceased thinking and talking of her, and looked with calmness and even with satisfaction upon his approaching death, though it afforded him no hope of meeting her again. It was an escape from the desolation of a life without her whom he had loved.

The following are his principal printed works, very few of which (if any) were published, and many of which are undated. They speak the history of his mind by their very titles:—

Miliaria accuratius descripta. Thesis habita in Univ. Dub., 1832; *An Account of the Drunken Sea*, Dub., 1840; *An Account of the Proceedings of the Government Police in the City of Canton*, Dub., 1840; *Dialogue between a Bilious Patient and a Physician*, Dub. (no date); *A Letter to the Secs. of the Dublin Mendicity Instit.*, Dub., 1840; *Report of a Meeting of the Informers of Dublin, the Day after the Execution of John Delahunt, by an Informer*, Dub., 1842; *Unripe Windfalls in Prose and Verse*, Dub., 1851; *A Half-year's Poems*, Dresden, 1854; *Notes of a Twelve Years' Voyage of Discovery in the First Six Books of the Eneis*, Dresden, 1853; *Thalia Petasata, a Foot-journey from Carlsruhe to Bassano*. In verse. Dresden, 1859; *Religion, Worldly-mindedness, and Philosophy* (Remarks on Dr. Cheyne) [s. l.], 1860; *Poematia*, Dresden, 1866; *My Book and other Poems*; *Six Photographs of the Heroic Times: The Eneis (I. and II.) rendered into Blank Iambic Verse*.

J. P. MAHAFFY.

THE CASKET LETTERS AT HATFIELD.

(First Article.)

AMONG the innumerable manuscripts preserved at Hatfield there are two of the famous Casket Letters which are said to have been addressed by Mary Queen of Scots to the Earl of Bothwell. They are not originals; but they are said by Mr. Froude to be genuine copies of the French originals (*History of England*, vol. ix. p. 62, note). These two letters were printed both in French and in Scotch upwards of three centuries ago, but they differ in many points from the Hatfield copies, and it is a question whether Mr. Froude is right in assuming these latter to be in the original French, or whether they are mere translations from the Scotch. To enable the reader to determine the point I will place before him, first, the letters as they were originally printed in Scotch and in French, and I will then place before him the Hatfield copies. On comparing the two he will probably be able to determine whether or not Mr. Froude has arrived at a correct conclusion.

With reference to the different languages in which these famous letters from time to time appeared, we must bear in mind that when they were first produced before Elizabeth's Commissioners at York, in the year 1568, they were in Scotch. Of this we have conclusive proof, for the despatch which they addressed to Elizabeth on the subject is still preserved in the Cotton Library, and the extracts which they give of Mary's letters are all, without exception, in Scotch. It is further stated in this despatch, and the fact is most material, that the Regent Murray and his col-

leagues declared in the most solemn manner that the letters they produced were in the handwriting of the Scottish Queen. There was no question of copies or translations. Murray and his friends were ready to swear that they were written with "her own hand." And yet these very same men were equally ready to swear two months afterwards at Westminster that the letters were in French, and in French accordingly they were produced before Elizabeth and her Ministers. Bearing these facts in mind, we proceed to lay before the reader one of the letters produced at Westminster, which corresponds with one of those now preserved at Hatfield:—

"J'aye veillé plus tard là haut, que j'en eusse fait si ce n'eust esté pour tirer ce que ce porteur vous dira, que je trouve la plus belle commodité pour excuser vostre affaire qui se pourroit présenter. J'ay promis que je luy menervay demain cestuy la. Vous aiez en soin si la chose vous semble commode. Maintenant j'ay violé l'accord; car vous aviez defendu que je n'escrivisse, ou que je n'envoyasse, par devers vous; neantmoins je ne l'ay fait pour vous offenser. Et si vous scavez en quell crainte je suis a present, vous n'aurez point tant de soupçons contraires en vostre esprit lesquels toutes fois je supporte, et pren en borne part comme provenant de la chose que je desire le plus de toutes celles qui sont sous le ciel et que je poursuy avec extremé diligence a sçavoir vostre amitié duquel les devoirs que je fay me rendent certaine et assurée. Quant a moy je n'en desespéreray jamais; et vous prie que suivant vos promesses, vous me faciez entendre vostre affection, autrement j'estimeray que cela se fait par mon malheureux destin, et par la faveur des astres envers celles, qui toutefois n'ont une tierce partie de loyauté et volonté que j'ay de vous obéir, si elles, comme si j'estoye une second amye de Jason, malgré moy, occupent le premier lieu de faveur, ce que je ne dy pour vous comparer a cet homme en l'infelicité qu'il avoit, ny moy avec une femme toute esloignée de misericorde comme estoit celle la. Combien que vous me contraignez estre en aucune partie semblable a elle, en toutes les choses qui vous concernent, ou qui vous peuvent garder et conserver a celle a laquelle seule vous estes entierement de droict; car je vous puis m'attribuer comme mien, qui vous ay acquis seul loyaument en vous aimant aussi uniquement comme je fay, et feray tant que je vivray, me rendant assurée contre les travaux et dangers qui en pourront advenir. Et pour tous ces maux, desquels m'avez esté la cause, rendez moy ceste faveur, que vous ayez souvenance de lieu qui est prochain d'icy. Je ne demande pas que vous me teniez promesse demain, ains que nous nous assemblions, et que n'adjustiez point de foy aux suspensions, sinon l'expérience faicte. Je ne demande autre chose a Dieu fors qu'entendiez ce que j'ay en l'esprit, qui est vostre; et qu'il vous garentisse de tout mal, au moins pendant que je seray en vie, laquelle je ne tient point chere sinon en tant que moy et elle vous sommes agreables. Je m'en vay coucher et vous dy a Dieu. Faites moy certaine de bon matin de vostre portement car je seray en peine jusques a ce que je l'entende. Comme l'oyseau eschappé de la cage ou la tourterle qui est sans compagne, ainsi je demeureray seule pour pleurer vostre absence, quelque brieve qu'elle puisse estre. Ceste lettre fera volontiers ce que je ne pourray faire moy mesmes, si d'aventure, comme je crain, vous ne dormez desia. Je n'ay osé escrire en presence de Joseph, Sebastian, et Joachim, qui ne faisoient que de partir quand j'ay commencé a escrire ces choses."

My impression is that this is a genuine letter of the Queen of Scots, addressed, not to Bothwell, as her accusers alleged, but to Darnley. But, as the original has long since disappeared, it may have been interpolated in parts. We know that it had been tampered with at York, where it first made its appearance in Scotch. In that language it was first presented to Elizabeth's Commissioners, with a solemn assurance that it was written "in Mary's own hand." I shall mark in italics the variations between this letter and the French original, as follows:—

"I have walkit [waked] laiter thair up then I wold have done gif it had not bene to draw *sum thing out of* him quilk this beirer will schaw yow whilk is the fairest commoditie that can be offerit to excuse your

affaires. I have promyst to bring him to him the morne. Put ordour to it, gif ye find it gude. Now Sir I have brokin my promeis because ye commandit me nouth to wryte nor send unto yow. Yit I have not done this to offend yow. And gif ye knew the fair yat I have presently ye wold not have so many contrary suspiciounis in your thocht, quilk notwithstanding I treit and chereis as proceeding from the thing in the world that I maist desyre, and seikis fastest to haif, quihilk is your gude grace; of the quihilk my behaviour sall assure me. As to me, I sall never despair of it, and prayis yow according to your promeis to discharge your hart unto me; utheways I will think that my malhure and the gude handling of hir that hes not ye third part of the faithfull nor willing obedience unto yow that I beir hes wyn agains my will yat advantage over me quihilk the second lufe of Jason wan not that I will compare yow unto ane sa unhappy as he was, nor yit myself to ane so unpitiful ane woman as scho. Howbeit ye caus me to be sumthing lyke unto hir in any thing that tuichis yow, or yat may preserve and keip yow unto hir to quhome only ye appertene; gif it be sa that I may appropriate that quihilk is wyn throch faithful yea only luifing of yow as I do, and sall do all the dayis of my lyfe, for pane or evil that can cum thair of. In recompense of the quihilk, and of all the evils quihilk ye have bene cause of to me, remember yow upon the place heir besyde. I craif with that ye keip promeis to me the morne; but that we may meit togidder and that ye gif na faith to suspiciounis without the cortanetie of thame. And I craif na uthir thing at God but that ye may know that thing that is in my hart, quihilk is youris, and that he may preserve yow from all evil, at the leist sa long as I have lyfe; quihilk I repute not precious unto me, except in so far as it and I baith ar agreeabil unto yow. I am going to bed, and will bid yow gude night. Advertiso me tymely in the morning how ye have fairin for I will be in pane unto I get worde. *Mak gude watch gif the burd eschaip out of the cage, or without hir mate. As the turtur I sall remane alone for to lament the absence, how schort yat sa ever it be.* This letter will do with ane gude hart, that thing quihilk I cannot do myself, gif it be not that I have feir that ye are in sleiping. I durst not wryte this befor Joseph, Bastiane and Joachim, that did but depart evin quhen I began to wryte."

It was in this shape that this letter was produced at York; and on comparing it with the French original it will be found that it has been altered in various places. "Tirer," for example, has been rendered "to draw out of him," to induce the reader to infer that Darnley is alluded to. "La faveur des astres envers celles" has received a totally different signification in the Scotch—i.e., "the gude handling of hir," to indicate Lady Bothwell, of whom the Queen was represented as being inordinately jealous. The Scotch translator has, moreover, mistaken the meaning of the passage which follows. Mary says:—

"Si elles, comme si j'estoye une second amyne de Jason, malgre moy, occupent le premier lieu de faveur," &c.; meaning, "if they, as if I were a second mistress of Jason [i.e., another Medea], occupy the foremost place in your affections—not that I would compare you to so unfortunate a man, nor myself to so remorseless a woman," &c.

But the translator has altered the sense by changing "a second love of Jason" into "the second love of Jason," alluding obviously to the well-known story of Medea, who was supplanted in Jason's affections by Glauce. Mary is accordingly made by the translator to speak of some one who might "wyn agains my will yat advantage over me quihilk the second lufe of Jason wan." And the blunder becomes more apparent by his immediately afterwards representing, not Medea, but this "second lufe" of Jason as the "unpitiful woman." The allusions in this letter can now only be matters of pure conjecture; but we know that Darnley gave the Queen abundant cause for jealousy, and she may in this passage have referred, half in jest and half in earnest, to some Court scandal of the day.

But the most remarkable variation between the French and the Scotch occurs towards the close of

the letter. The passage in question is thus expressed in the French:—

"Comme l'oyseau eschappé de la cage, ou la tourtre qui est sans compagne; ainsi je demeureray seule, pour pleurer vostre absence quelque brieve qu'elle puisse estre."

How is this very simple and natural sentiment rendered in the Scotch?

"*Mak gude watch*, gif the burd eschaip out of the caige or without hir mate. As the turtur I sall remane alone for to lament the absence how schort yat sa ever it be."

No one can doubt which of these two passages is the original; and no one can doubt that the remarkable variation introduced into the Scotch was designed to give a criminal meaning to an expression perfectly innocent in itself. The words "*mak gude watch*" do not occur in the French at all; and, applied as they were to the escape of a bird from its cage, the Commissioners at York could come to no other conclusion than that they referred to Darnley. Of this particular passage, accordingly, they made mention in their letter to Elizabeth. "The Queen wrote to Bothwell," they say, "especially to make good watch that the bird escape not out of the cage." The interpolator, whoever he was, makes sad havoc of the French original, which is both clearly and gracefully expressed. His version is so clumsy and confused as to be at first sight hardly intelligible. But the words which he introduced served his purpose, by attracting the attention and rousing the suspicions of Elizabeth's Commissioners, who only had his version of the letter before them.

We come now to the Hatfield letter, which will be found to differ in various points from that published by the authority, or at least by the convenience, of Elizabeth's Ministers in 1571, and which we have printed above. On further examination it will be found to be a translation, and a very literal translation, from the Scotch. The following is the Hatfield letter, with the passages marked in italics which differ from the French original, but which correspond as nearly as possible with the Scotch:—

"J'ay veillé plus tard la hault que je n'eusse fait si ce n'eust esté pour tirer ce que ce porteur vous dira: que je treuve la plus belle commodité pour excuser nostre affaire qui se pourret présenter. Je luy ay promise de le lui mener demain. Si vous le trouvéz bon, mettez y ordre. Or, monsieur, j'ay rompu ma promesse; car vous ne m'avez rien commandé de vous envoyer, ni escrire. Si ne le fais pour vous offenser; et si vous scaviez la crainte que j'en ay, vous n'auriez tant des subçons contraires que toutefois je chéris comme procédant de la chose du monde que je desire et cherche le plus: c'est votre bonne grâce de laquelle mes deportemens m'assureront, et je n'en disesparay jamais tout que selon vostre promesse vous m'en dischargez vostre coeur. Autrement je penserais que mon malheur et le bien composer de ceux qui n'ont la troisieme partie de la fidélité, ni volontair obissance que je vous porte, auront gaigné sur moy l'avantage de la seconde amyne de Jason: non que je vous compare à un si malheureux; ni moi à une si impitoiable, combien que vous m'en fussiez un peu ressembler en chose qui vous touchat ou pour vous préserver et garder à celle à qui seule vous appartenés si l'on se peult approprier ce que l'on acquiert par bien et loyalement voire uniquement aymer comme je fais et fairay toute ma vie pour peun ou mal qui m'en puisse avenir. En recompense de quoy et des tous les maux dont vous m'avez esté cause, souvenez vous du lieu icy près. Je ne demande que vous me tennés promesse demain, mais que nous trouvions et que n'adjoustiés foy au subçons qu'aurés, sans vous en certifier, et je ne demande à Dieu si non que coignoissies tout ce que je ay au coeur, qui est vostre, et qu'il vous préserve de tout mal au moys durant ma vie qui ne me sera chère qu'autant qu'elle et moy vous serons agréables. Je m'en vais coucher et vous donner le bon soir. Mandés moy demain comme vous serez porté à bon heur, car j'en seray en peun, et faites bon quet si l'oiseau sortira de sa cage ou sans son per [sic] comme la tourtre demeurera soulle à se lamenter l'absence

pour court qu'elle soit. Ce que je ne puis faire, ma lettre [sic] de bon coeur si ce n'estoit que je ay peur que soyés ondormy; car je n'ay osé escrire devant Joseph et Bastienne et Joachim qui ne font que partir quand j'ai commencé."

No one can compare, even in the most cursory manner, this letter with the Scotch without coming to the conclusion that the one is a translation, and a very literal translation, from the other. We find both the blunders and the interpolations of the Scotch translator faithfully reproduced in the French. But it may possibly be said that Mr. Froude may be right after all, for of the two letters the French may be the original and the Scotch a translation. The answer to this simply is that if the Hatfield letter is genuine, Mary's enemies not only published in 1571 a spurious version of it, but that they struck out the only expression in it—"make good watch," &c.—which plainly betrayed a criminal intent on the part of the writer. Such forbearance on the part of Mary's adversaries at a time when they were moving heaven and earth to make the world believe that she was the most wicked and abandoned of her sex is inconceivable. I say nothing of the omissions or of the orthography of the Hatfield letter further than that both furnish strong confirmatory evidence that it is not a copy but a translation.

I have stated my belief to be that this letter, as originally written, was a genuine production of the Queen of Scots, but addressed, not to Bothwell, but to Darnley. I believe that of the eight Casket Letters produced at Westminster three of them were of this description, and all originally written in French. The remaining five I believe to have been forged, and all to have been originally composed in Scotch. We know that the so-called examination of these letters was made in a very hasty and superficial manner, and that it was made, moreover, in the absence of the accused, or of any one to represent her. The following was the mode of procedure as described in the words of the official record:—

"And it is to be noted that at the time of the producing, shewing and reading of all these foresaid writings, there was no special choice nor regard had to the order of the producing thereof, but, the whole writings lying altogether upon the council table, the same were one after another shewed rather by hap, as the same did lie on the table, than with any choice made, as by the natures thereof if time had so served might have been," &c. (Anderson, vol. i. p. 19.)

It is clear, therefore, that no kind of order was observed in the proceedings of the council; and we may observe that, under the circumstances, to mix up a few genuine letters of the Queen with the forgeries was a device more ingenious than daring. Before so friendly a tribunal there was little danger of exposure; and whoever imagines that Mary's adversaries were incapable of such baseness can know but little of their previous history.

The second of the Casket Letters preserved at Hatfield is supposed to have been written from Stirling previous to the seizure of the Queen by Bothwell. I shall reserve my remarks upon it for a future number. JOHN HOSACK.

CORRESPONDENCE.

THE OERA LINDA BOOK.

29 Delamere Terrace, W.: Aug. 7, 1876.

It may interest some of your readers to know that the Over de Linden family have at last consented to send a page of their MS. to be examined by Frederik Müller, of Amsterdam, the most competent expert in the Netherlands. He gave a very decided opinion that the writing was certainly not more than seventy-five, and perhaps only twenty-five, years old. Before communicating this reply, however, to the family, he sent on the page to Mr. P. S. Van Gelder, the head of the great paper-factory at Apeldoorn, and received from him the opinion that the paper in question was undoubtedly made at the factory of Messrs. Zielens and Schrammen, at Maestricht, about thirty years ago. Mr. Over de Linden has sent to the Helder to have the paper chemically analysed, according to the present number of the *Nederlandsche Spectator*, which gives us the above particulars. But there can be no doubt that we are hearing the last about this notable hoax.

EDMUND W. GOSSE.

PETER VISCHER AND JACOPO DE' BARBARI.

Stanmore Hill: August 4, 1876.

In the letter from M. Burty published in your last number he refers to a very elegant edition on large paper of M. Ephrussi's *Notes Biographiques* on Jacopo de' Barbari, originally published in the *Gazette des Beaux-Arts*.

It would seem from M. Burty's remarks on that able paper, particularly in respect to a bronze bas-relief of which an etching is given, that he was not aware how Dr. von Lübke had confirmed my own observations and opinion, conveyed to its owner, M. Dreyfus, and to M. Ephrussi, that the bronze in question was a work by Peter Vischer, and not by Jacopo, who is unknown as a sculptor. The following is an epitome of Dr. von Lübke's remarks, which appeared in the *Beilage zur Allgemeinen Zeitung* for May 30 last. Dr. von Lübke is at present engaged upon a large and amply illustrated folio work on Peter Vischer and his productions.

C. DRURY E. FORTNUM.

Referring to communications, photographs, &c., which he had received from Mr. Drury Fortnum, of Stanmore Hill, the possessor of two of the works in question, Dr. Lübke first proceeds to describe and comment upon them. They are both inkstands, of bronze, and of nearly equal size; each represents the same idea, differently rendered. A nude female figure stands at the side of a vase—the receptacle for the ink—and rests her left hand thereon; with her right she points upwards; a skull is on the ground, also a shield and a sword in one instance, in the other the shield, enriched with a Medusa's mask, rests against the vase, and a sceptre is on the ground in lieu of the sword. On a label, the inscription, cast in relief in both examples, and in carefully-formed Roman lettering, reads *VITAM NON MORTEM RECOGITA*, by which the allegory is explained. It is important to notice in detail the differences between the two works, as indicative of the relative period of their production, and the influences under which they were produced.

On that which Dr. Lübke considers to be the earliest we find in the composition and rich

ornamentation a beautiful play of early Renaissance sentiment mingled with the Mediaeval. In the sharp outlines of the quadrangular vase and cover you recognise Gothic forms, while the ornamentation consists of acanthus-leaves and scrolls, with medallion portraits on the panels; among the former the well-known emblem of the master, two fishes back to back transfixed upon a spear, is four times repeated; it is supported on four lion's feet. A square base with fluted moulding is beneath.

The master's passion for ornament is here fully indulged, but the chief interest centres in the female figure. She rests entirely upon the left leg, while the right is slightly bent as she thrusts the skull behind her with that foot. The beautiful and life-like rhythmic movement expressed by this small figure is perfect; the bent right arm; the graceful little head, surmounted by a winged helmet, is turned slightly sideways and posed upon a short neck. The figure, somewhat short and thickset, is characteristic of the German Renaissance, "but in the entire range of its early revival we shall hardly find a second nude figure of such perfection in form, in vivid resemblance to life, and in masterly vigour of contour." The movement of the right limb would indicate the influence of the Italian Renaissance of about 1500. I should (writes Dr. Lübke) be inclined to place the execution of this work between 1510 and 1515, from its correspondence in manner with the St. Sebald's shrine.

The other is of later date. The female figure is of more slender form, and of greater elegance and refinement. It is especially interesting to note how the artist has freely varied and modified the same idea. In this everything is less strained, less sharply defined, the lines flow with more ease, the treatment is softer. Resting on the left foot, the right touches the ground; in harmony with this movement the left arm is slightly drawn inward, the hand laid upon the vase; the right is raised, that hand pointing upwards, the head following the motion with an upward gaze. It is the work of a period of greater development, but of less spontaneous freshness; all is simplified, the ornamentation subdued; the vase of elliptic form is also eminently of Renaissance character, as is its ornamentation. Behind the figure a round shield and a sword lie upon the ground; the skull is before her; an elongated square tablet rests against the vase, bearing the same inscription, but accompanied by the initials P. V., between which is the emblem of the two impaled fish; beneath the base the date, 1525, and another emblem, the barbed hook, cruciform above, are incised. In contrast to the graceful and free taste for decoration seen in the first work, here we notice a straining after simplicity, and accordingly we recognise a production of the artist's most mature and fully developed period, when, divesting himself of a fantastic mixture of ancient and mediaeval form, he yields to the stronger influence of the Italian Renaissance. This second work stands in the same relation to the first as the well-known, but lost, *Rathhaus Gitter* to the St. Sebald's shrine. "We have, besides, in both these masterpieces a further proof of that gradual aesthetic development throughout which Peter Vischer stands as a prototype of the entire current of the German art of that period." This second work is evidently the same which, according to Heller, was once in the Silberrad Collection, and designated an "Allegory; the Reminder of a Future Life." Both these bronzes are important from the fact that Peter Vischer's monument in St. Rock's Church in Nuremberg bears the same inscription, evidently adopted by him as his own motto; and, while the allusion to everlasting life has been conceived in a truly Christian spirit, yet the conception of these charming female figures in unveiled beauty and youthful vigour, as representing an emblem of earthly life, exhibits the peculiar sentiment of the Renaissance.

The metal of this last bronze has been covered

with a dark artificial *patina*, showing traces of gilding in certain details; that of the earlier work has not been coloured, and resembles in quality that of St. Sebald's shrine.

To these we may add another discovery recently made. In the *Gazette des Beaux-Arts* M. Charles Ephrussi has published an able essay on *Jacopo de' Barbari*, to which is added a masterly etching from a bronze bas-relief belonging to M. Dreyfus, of Paris, and representing Orpheus and Eurydice (see ACADEMY, July 29, 1876). This bronze he believes himself justified in ascribing to that Venetian master, from its bearing an emblem having at first sight some resemblance to the Caduceus. (On examining this relief, Mr. Fortnum immediately recognised in the emblem the impaled fish rather than the Caduceus, while the manner of treatment corresponded precisely with the workmanship of the inkstands, thus declaring the handiwork and the mark of Peter Vischer.)

This subject has also been twice treated by the master, for we have at Berlin another bronze bas-relief of similar subject but differently rendered, as in the case of the inkstands.

The Paris relief seems to be the earlier work, the Berlin later. Orpheus is standing; his head turns to the right, while playing the viol to Eurydice, who is at his side. We notice a certain harshness of treatment, although her attitude is beautiful; she holds a light scarf by her right hand, while with the left she makes a gesture of regret and hesitation; her long tresses, beautifully depicted, wave around her graceful head and faintly flutter in the wind. There is something harsh and awkward in the figure of Orpheus, the upper portion of which is imperfectly modelled, while the legs are very long. The head is of a German, not an Italian, cast. Steep cliffs, the frontiers of the nether world, rise behind Eurydice.

In the Berlin relief, the relative position of the figures is the same, but their action is totally different. Orpheus advances towards the left, poised on that foot, while he raises and draws the right after it; he plays a violin, rested beneath his shoulder, and crosses the right arm over the chest to wield the bow; the head is in profile, gazing at Eurydice. In treatment his figure is more easy, more lifelike, more rhythmic, than in the Paris bronze. A double motion is expressed in Eurydice, for, sorrowful and gazing at her beloved musician, she is yet moving to return to those regions indicated by flames at her feet; a light veil floats gracefully behind her, raised by the left hand to shroud her head, as in sorrow; her figure is softer and more delicate in outline.

From all this we conclude that we have here a second and more perfect production.

The relation between this work and Dürer's *Adam and Eve* of 1504 is merely external. Dürer's engraving may have had some influence on Vischer, but we must bear in mind that certain leading attitudes and gestures were common property in the time of the Renaissance.

"These four small works of Vischer's have this especial value to us, they afford us important revelations as to his relations with the antique, inasmuch as the greatest creation of his later period, the *Rathhaus Gitter*, is now lost." The same process of a gradually-increasing refinement and lucidity of thought in the Renaissance spirit, which makes itself manifest from St. Sebald's shrine to the *Rathhaus Gitter*, can also be traced in these small works, and surely it is interesting to note how the same restless straining after perfection and freedom revealed by the two inkstands has also produced a second treatment of the Orpheus relief. We may add that the embryo conception of the Grand Apostles of the shrine of Sebald, those purest creations of German ecclesiastical art of that period, can be traced in its earliest form in the monument of Archbishop Ernst at Magdeburg.

Another composition of Vischer's school offers

us a further subject for considering how the Renaissance reached us. The little nude archer, still at Nuremberg, bears the date of 1532, and was the work of one of Peter's sons. The idea of that figure is taken from Jacopo de' Barbari's engraving (ably reproduced in M. Ephrussi's essay), but altered in the details. We are struck by the modelling of various parts more German than Italian in conception, and from which, as we have seen, Peter Vischer was able to free himself and to arrive at nobler relations with, and a purer ideal of, beauty.

SCIENCE.

On Fermentation. By P. Schützenberger, Director of the Chemical Laboratory at the Sorbonne. With Twenty-Eight Illustrations. (London: Henry S. King & Co., 1876.)

THE subject of fermentation, taking the alcoholic kind as the type of a series, has been a perplexing one to chemists, and can only be understood by studying the physiology of the ferments, as well as noting the composition of the fermentable bodies, and the results of the process. At first it seemed simple enough that sugar should be divided into alcohol and carbonic acid, and this was the notion of Lavoisier founded upon the imperfect analysis that was practicable in his days. Further researches, however, showed that before cane-sugar entered into the fermentation provoked by yeast it took up water, by an action which Berthelot proved was due to a soluble ferment contained in the yeast. It was also discovered that, besides alcohol and carbonic dioxide, small quantities of glycerin and succinic acid made their appearance. According to the researches of Pasteur, cited by Schützenberger, "the glycerin and succinic acid are produced at the expense of the elements of sugar." Also, besides this, "the sugar yields a certain portion of its substance to the new ferment which is developed, and the lactic acid, the production of which in variable quantities has been observed in alcoholic fermentation, is the result of a special fermentation, differing from alcoholic fermentation, and proceeding simultaneously with it."

M. Schützenberger points out that, "by adding together the formulæ of glycerin and succinic acid, atom by atom, we arrive at a sum in which hydrogen and oxygen are in the proportions to form water. Thus, succinic acid $C_4H_6O_4$ + glycerin $C_3H_8O_3 = C_7H_{14}O_7$, and $C_7H_{14}O_7 + H_2O = 2 C_3H_8O_3 + CO_2$," which explains the formation of glycerin and succinic acid at the expense of glucose.

Pasteur found the proportions of these substances varying according to the rate of the fermentation, being greatest when it is slow, or when the yeast is less pure, or supplied with but few alimentary principles. A sufficient quantity of albuminoid and mineral matter being present to feed the yeast gives as a result more alcohol and less of the other bodies. Small quantities of acetic acid are also constantly met with in alcoholic fermentation, and increase in quantity when the yeast globules are not well nourished.

The substances susceptible of alcoholic fermentation comprise "all bodies capable of producing glucose and its congeners by

hydratation," such as starch, dextrine gum, and the various glucosides found in vegetable tissues.

The fermentation of cane-sugar comprises two processes: first, the hydratation of the sugar, which "changes it into two isomeric molecules, one of which crystallises and causes the plane of polarised light to deviate to the right, and the other remains uncrystallisable and turns it to the left (*levulose*);" and the second, the formation of alcohol and other products, as acts correlative with the life and growth of the ferment. Liebig endeavoured to explain fermentation by a purely chemical theory, but, now that all controversy on this question is over, it is easy to perceive that, when the yeast performs its vegetative functions of respiration and digestion, it sets up molecular motions in the sugar, which are strictly chemical, though connected with its life, and not with its decomposition.

The exact relation in which the yeast plant stands to other fungi is by no means clear, but it is not probable that the various kinds of yeast to which separate names have been given are good species, or that the "spores" obtained by Engel by a process Schützenberger describes are the only reproductive bodies that are formed. We do not notice in Schützenberger's book any reference to the experiments of Berkeley and Hoffmann, who succeeded in developing yeast into *Penicillium glaucum*; and in the last edition of the *Micrographic Dictionary*, in which Mr. Berkeley assisted, yeast is spoken of as the conidial form of that mould. In 1865 Hoffmann stated that, while beer-yeast gave rise to *P. glaucum*, yeast from brandy distilleries, kept almost dry, produced *Mucor racemosus*, either alone or together with the former.

Engel's mode of causing the yeast-cells to form spores consists in starving them. He moulds some plaster of Paris a little smaller than a vessel in which he puts it, so that there may be a space between it and the vessel's sides. The smooth surface of the plaster is moistened with fresh yeast diluted with water, and placed upwards in the vessel; water is then poured between the plaster and the vessel's sides, and the whole covered with a piece of glass. The cells which are least rich in protoplasm break up, but the others in six or ten hours form dense spots, which gradually grow into from two to four "spores," if such they can be truly called.

Schützenberger, referring to the properties of *Mucor mucedo* and *M. racemosus*, which, when placed in solution of sugar and protected from oxygen, grow like yeast, and excite the alcoholic fermentation, observes that these facts "give considerable support to the theories brought forward by some men of science as to the transformation of ferments from one to another, according to the conditions under which they are placed."

Pasteur's experiments showed that a salt of ammonia could serve as a nitrogenous food for yeast, though modified albuminous substances may be termed its natural nutriment. Mayer is referred to by Schützenberger as having shown that the inactivity of a greater part of these substances in their unaltered state arises from their not being

diffusible through the membranes of the yeast-cells when, partly decomposed by infusoria or mucedines, they become diffusible, and the yeast can digest them. It is considered that the wort of beer, and similar substances, nourish yeast, not by their albuminoid principles, properly so called, but by "allied nitrogenous substances, analogous to peptones, which have the property of passing by osmose through membranes." Washing out the soluble matter from yeast-cells weakens their powers, which may be explained by Berthelot's recent discovery that a membrane moistened on either side by two different fluids is able to effect electric decompositions. The washing tends to make both alike.

An interesting portion of Schützenberger's observations relates to the probability that the carbon required by the yeast, and which it obtains from sugar, is digested in the condition of a particular hydrate. He thinks that when plants possessing chlorophyll act upon carbon dioxide they convert it into a special hydrate, which is carried to various parts, and serves for a development of the cells that contain no chlorophyll. In its action upon the sugar it digests, the yeast may, at the moment of decomposing that body, cause its carbon to form a similar hydrate. Some such compound Schützenberger forms by treating white cast iron, which contains carbon, with cupric sulphate. The iron is thus dissolved, and when the copper is removed by contact with a solution of iron perchloride, there remains a pulverulent black mass, which is a definite carbon hydrate.

Yeast in its natural state absorbs oxygen freely for its respiratory functions; concerning which Schützenberger details a number of interesting experiments. Yeast readily deoxygenises red blood, and Pasteur shows it is able to grow when free oxygen is absent from a saccharine solution by taking that gas from the sugar. This power of breathing at the expense of sugar can be employed concomitantly with the absorption of free oxygen, and the production of alcohol and carbonic dioxide may be "the consequence of disturbance of equilibrium due to this partial abstraction of oxygen." When yeast has exhausted the sugar in a solution, it acts upon its own tissues and cell contents, still evolving the products of fermentation, together with other substances derived from its nitrogenous compounds. All living organisms, besides assimilation, carry on an opposite process of excretion, and Béchamp considers that the evolution of alcohol and carbon dioxide belongs to the latter mode of action.

Some of Pasteur's conclusions have been strongly contested in Germany by Brefeld and Traube, and especially his statement that the yeast-plant could live and produce fermentation when quite deprived of free oxygen, but at the meeting of the French Academy on May 8 the distinguished French chemist was able to state that Dr. Brefeld had repeated his experiments, and handsomely avowed his error, now admitting that the results he obtained with *Mucor racemosus* and with beer yeast confirmed what Pasteur had said.

The chapter on "Soluble Ferments" con-

tains a great deal of interesting matter, which we cannot now notice, but we do not observe any allusion to the statements made a few years ago by Béchamp, which seemed to connect the action of these substances with the appearance of living microzymes.

In the notice of acetic fermentation the vinegar-plant is of course mentioned, but M. Schützenberger does not seem to be acquainted with the interesting and instructive form used in many English households to obtain good vinegar from treacle and sugar. In this state it is like a stout piece of soft buff leather, which contains myriads of bacteria-like bodies in addition to yeast-cells. As it grows it splits horizontally, and any little piece placed in a solution of lump sugar soon forms a growing mass, transparent enough for convenient examination.

In conclusion, it may be said that this work is decidedly one of the best of the "International Series." It is a valuable guide to what has already been ascertained, and it leaves a conviction that future labours should be specially directed to the life history of the various fungi concerned in fermentation, in which important discoveries have still to be made. HENRY J. SLACK.

The Principles of Comparative Philology. By A. H. Sayce, Fellow and Tutor of Queen's College, Oxford, &c. &c. Second Edition, Revised and Enlarged. (London: Trübner & Co., 1875.)

THE appearance of a second edition of Mr. Sayce's *Principles of Comparative Philology* within less than a year of the issue of the first is a welcome sign of the interest taken in the subject which it discusses. The book in itself well deserves its rapid success. Readers of the ACADEMY will be prepared for the wide range from which Mr. Sayce draws his arguments and his illustrations, for the freshness and independence of his views, and for the vigorous and transparent style in which they are stated. But the work is not one particularly adapted to that somewhat mysterious personage the "general reader"; it enters too much upon the discussion of details to be entirely welcome to the tyro, and it is in general at least as much a work of criticism as of exposition. Hence the public may fairly claim to share with the author the credit of the hearty welcome which it has received.

The book consists of eight chapters, the substance of which was delivered in the form of lectures at Oxford early in 1873, with a ninth, subsequently added for the purpose of dwelling more at length on the important subject of the influence of analogy on language.

The first chapter contains an excellent account of the sphere of comparative philology, and its relation to the other sciences. Mr. Sayce is an adherent of what may be called the "common-sense" views of language. He is not less emphatic than Professor Whitney in the stress which he lays upon its social character, as bringing it within the sphere of historical science; and is justly severe upon the undue limitation of glottology to phonology, or to what has often been termed philology. But perhaps

he has not quite fully appreciated—he has certainly not stated his appreciation of—the causes which have led to the excessive importance attached to phonology. The fact is that it is here chiefly, if not solely, that glottology as yet walks with the assured step of science. There are many points in morphology in which doubt is still permissible. Westphal's views, for instance, may be, and probably are, demonstrably erroneous; but at least they are defended with argument by a considerable scholar. The same is the case still more clearly with the wider questions with which Mr. Sayce is dealing in the greater part of this volume. But if a writer were now a days to attack Grimm's law, or to ignore the loss of the palatal spirant in Greek, his work would be justly relegated to a place in the "Budget of Paradoxes" by the side of the lucubrations of "Parallax." Hence probably the tendency to an undue limitation, which Mr. Sayce rightly protests against. The whole of this lecture is admirably sound and clear; but a few of the *obiter dicta* in it seem to require reconsideration. After all that Ritschl and his school have done to demonstrate the true nature of the pronunciation of the Latin comic dramatists, Mr. Sayce would not surely defend the extraordinary scansion which he has quoted from Donaldson's *Varronianus* on p. 17. Whatever the merits of that ingenious but most untrustworthy work, forms like *fail* (= *facile*) and *oēilos* (= *oculos*) are simply survivals from a pre-scientific age. The parasitic *w* and *y* seem much more like products of laziness than of emphasis (p. 30), if we may judge from the character of those English dialects in which they are common. Fick, in connecting *μέρονες* with *μάργρω*, and translating the word "Greifer, Begreifer" (*Kuhn's Zeitschr.*, xx. 3), can hardly have meant the epithet to be understood as "snatchers," but rather as "graspers, comprehenders;" and the Homeric usage seems to point rather to some force of this kind. The explanation of the absence of *guna* in the dual and plural (p. 32) of forms like *οἶδα* is, perhaps, still open to doubt, although it has Benfey's sanction. Ought not "the Book of Common Prayer" to be substituted for "the authorised version of the Bible" in the following passage?—

"Much of the charm of the authorised version of the Bible is due to the fact that the translators have usually tried to bring out the meaning of a Greek word by using two English equivalents, one from a Romanic, the other from a Teutonic source."

An unfortunate misprint in the first edition (p. 29) still remains uncorrected: of course it is *hoarse*, not *horse*, which represents the O.E. *hās*.* These are but incidental references, but perhaps they are worth noticing in a book of the stamp of Mr. Sayce's.

The second lecture begins the attack on the *Idola* of the science, as it has been too often treated. The first is absolutely indefensible—that the laws of the science of language should be determined from the Aryan family alone. Like the second—the hypothesis of primeval centres—it would seem hardly to require the powerful battery which

* Mr. Sayce writes A.S. *hās*; but *hās* is only fourteenth-century English, and *hās* is the A.S. form. Probably Dr. Morris's use of O.E. has misled him.

Mr. Sayce brings against it, if it were not that experience shows how much harm it is capable of doing to those who, perhaps quite unconsciously, are misled by it. But with regard to the second, it is worth while making two remarks. In the first place, as it did not originate on linguistic grounds, so it is evident that it will not be overthrown by linguistic arguments. The question of the primitive condition of man is one which is to be settled by so much converging evidence, all of which has to fight its way through a mass of prejudice, that philologists may well keep aloof from the fray. They may content themselves with maintaining that, without assuming a portentous miracle, it is simply impossible that the utterly irreconcilable ways of viewing objects and their relations to each other and to the subject, which are revealed by the structure of different families of languages, should ever have had a common origin. But in the second place, if instead of regarding the totality of mankind, we look simply at the Aryan stock, Mr. Sayce's assumption of an original condition of dialectic variety seems far less tenable. If there never was "one original common stock-in-trade of radicals," does not the extensive similarity become an inexplicable phenomenon? Of course, no one would assert that *every* root now found in any Aryan tongue must have existed in the *Ursprache*, still less in every member of it. But when we allow for (1) the borrowing of roots from contiguous non-Aryan tribes, and (2) the differing selection made by different branches from a large stock of synonyms, there is little left to be explained by primitive dialectic differences of this character. The number of roots in Greek which exist in no cognate dialect, or but in one or two, need prove no more than the existence of *Pferd*, *horse*, and *equus* for the separateness of German, English, and Latin. It is positively easier to believe that, out of the ocean of inchoate attempts at language, there was a definite crystallisation in a particular form at one point supplied by a highly-gifted race, than to suppose that the same took place in closely-resembling forms at neighbouring points.

In his fourth chapter Mr. Sayce crosses swords with opponents more worthy of his steel, and boldly challenges what has come to be regarded as the only orthodox doctrine of roots and inflexions. In the first place, he denies that there ever was a period when men talked to each other in roots; he cannot even conceive the existence of such a period. "How *could* men talk with one another in single isolated syllables which wanted 'all designation of their relations'?" In the second place he denies that inflexion either did or could originate in agglutination. Among the Aryan races, he holds, roots were only types unconsciously felt, which lay at the bottom of the consciously-spoken word. Indeed, the Aryan brain "could produce only an inflexional language." The sentence is the unit of language, not the word; and to form a sentence words must from the first be provided with distinctive marks of their mutual relations.

Now, on the first point, I cannot think that Mr. Sayce has made good his position. It is idle to quote authorities in science,

where the question is one of a fact that may be verified; but it is not so where we are dealing with what is conceivable. Professor Max Müller's judgment (*Lectures*, ii., 84), "These germinal forms would have answered every purpose in an early stage of languages," has received the express approval of Professor Curtius (*Zur Chronologie*, p. 23), and is substantially that of Bopp, Heyse, Steinthal, Schleicher, and Whitney. Of course, if we admit of nothing but verbal roots, we involve ourselves in needless difficulties. But it is surely legitimate to regard a root as conveying a conception, which may be equivalent to a verb, a substantive, or an adjective, according to circumstances. As Mr. Sayce himself says, "Thought first lies implicit, indetermined, and confused, in a kind of rough block." Can we imagine any instrument better adapted to express this early communism of thought, and therefore of speech, than the single root which "can mean" nothing except interjectional vagueness? To say that *ak* means "to be sharp or quick" is limiting ourselves needlessly; it may just as well have been used to denote "quickness" or "quick." And every philologist would admit that at a very early period "pronominal elements," to which Mr. Sayce is a little unkind, were employed to supplement the gesticulations which had hitherto helped out the roots. We may leave it to the psychologist to determine whether such an hypothesis involves an "embryonic chaos of unconscious thought," if indeed unconscious thought be possible. But to say that by means like these it is impossible to express feelings and elementary judgments, is to ignore the lessons which may be learnt in that invaluable school for the glottologist, the observation of children.

On the question whether the process by which the Aryan *Ursprache* passed into the inflected state is sufficiently akin to that of agglutination to be identified with it, the last word has certainly not been said yet. Possibly the solution may be found in accentuating the difference between pronominal elements and verbal roots. Be this as it may, it is quite unfair of Professor Whitney to confuse the theory of Mr. Sayce with the metaphorical mysticism of the Schlegels, and to use of the former (*Oriental and Linguistic Studies*, i. p. 284) language which is proper only of the latter. Westphal, with whom Mr. Sayce here agrees, has taken pains to expose the superficiality of the views of both the Schlegels (*Vergleichende Grammatik*, p. xiii.). On the other hand, it is surprising to find Mr. Sayce saying of Westphal's third and fourth arguments (p. 149) that "they cannot well be controverted." Does any other philologist of repute now doubt that in the *n* of (say) *legunt* we have, as Pott and Schleicher showed long ago, the pronominal demonstrative *an*, which meets us *inter alia* in *ille* (= *olle* = *onole*)? And what right has Westphal to say that the thematic vowel ("fulcrum-vowel") of *bhav-a-ti* is explained as demonstrative, and then to reject this explanation as absurd? Every theory has a right to be judged in its most recent and perfect form; and Professor Curtius explains this *a* as giving, alike to noun and to verb, the notion of continuance

(cp. e.g., *Das Verbum*, i. p. 14). This explanation is at once easy and by no means "devoid of sense in such a position." Westphal's first argument is stated here in a misleading form; his second, which would be perhaps generally considered his strongest, loses much of its weight when we remember that it is based upon a theory defended by Curtius in his *Tempora und Modi*, and afterwards abandoned by him as untenable. There are some good remarks upon it by M. Bréal in his translation of Bopp, vol. iii. p. liv.

The limits of the present notice do not admit of even a brief survey of Mr. Sayce's remaining chapters. They are full of interest, and crowded with illustrations chosen from a wide range of languages, especially from those which Mr. Sayce has made so pre-eminently his own; but they do not traverse so much debateable ground as the earlier chapters, with the exception of the one upon the doctrine of roots, which has been touched upon already in anticipation. In the chapter on Philology and Religion Mr. Sayce deserves thanks for again raising a protest against the neglect of etymology by some writers on comparative mythology. As he justly says, it is this alone which gives security to our conclusions. "To discover the sun on the horizon of the sea in the frog-prince of the fairy-tale is to transgress the boundaries of scientific evidence." It is probably only by a slip that *Herculus* is derived from *arcere* instead of *hercere*; but it is strange that *cotemporary* is not impossible to a scholar who knows his Bentley.

The concluding lecture on the Influence of Analogy on Language is distinguished by admirable sobriety. The action of this principle is so extensive, and some of its effects so interesting, that there is every temptation to push it beyond due bounds. Some of the younger philologists, especially, have used it unsparingly; and there is danger lest, as Professor Curtius says, we should find "analogy" made into a huge receptacle for all unexplainable odds and ends. It is therefore the more satisfactory to find that among Mr. Sayce's numerous illustrations of its action, there is not one which can fairly be called into question.

The fresh and suggestive arguments with which, in an appendix, Mr. Sayce tries to demonstrate a course north of the Caspian for the westward Aryan migration, deserve to be compared with those by which Ernst Förstemann (*Geschichte des Deutschen Sprachstammes*, i. pp. 333-336), from an entirely different standpoint, comes to the same conclusion. The latter require us, by the way, to reject the explanation of the name *Caucasus* (older than Isidore, for it appears in *Pliny*, vi. 17, § 19) accepted by Mr. Sayce (p. 119), and to find in it a Slavo-Teutonic word for height or mountain. The phonetic corruption on which the other interpretation rests will hardly find favour with most etymologists.

To conclude a notice which the wide range covered by the work under review has made of necessity very discursive, whatever may be the final judgment of scholars on Mr. Sayce's distinctive theories, the book in which he has set them forth is exceedingly attractive, and cannot be neglected by any student of comparative philology.

AUGUSTUS S. WILKINS.

SCIENCE NOTES.

PHYSIOLOGY.

On Vaso-motor Nerves.—Kendall and Luchsinger have repeated many of the experiments described by Goltz (*ACADEMY*, August 14, 1875), and have arrived, in the main, at similar results (*Pflüger's Archiv*, xiii., 4 and 5). They fully accept his view as to the maintenance of arterial tonus by peripheral organs of a ganglionic nature situated upon, or in close proximity to, the walls of the vessels. These peripheral ganglia they believe to be connected with the cerebro-spinal axis by two sets of nerves, one of which conveys vaso-constrictor, the other vaso-dilator impulses. To illustrate the *modus operandi* of these antagonistic fibres, they refer to Bidder's view of the innervation of the submaxillary gland. According to him, the tonus of the blood-vessels supplying the secreting tissue of this gland is maintained by the automatic influence of a local centre, the submaxillary ganglion, whose functional activity is increased by irritation of the fibres supplied to it by the cervical sympathetic, diminished or inhibited by stimulation of the vaso-motor fibres contained in the chorda tympani branch of the facial nerve. Although their own investigations were limited to the sciatic nerve of the dog and the cervical sympathetic of the rabbit, Kendall and Luchsinger extend the above generalisation, not merely to all the cutaneous arterioles throughout the body, but to those supplying the tissue of the voluntary muscles as well. In fact, they are disposed to push the analogy which undoubtedly subsists between the innervation of the heart and that of the peripheral arteries as far as possible. Just as the normal contractions of the heart are kept up and regulated by its intrinsic ganglia, so the normal tonus of the vessels is maintained by perivascular organs of a similar kind; just as the activity of the intra-cardiac centres may be increased by impulses propagated along the accelerator nerves from the cerebro-spinal axis, diminished by such as travel along the vagi, so the activity of the perivascular ganglia may be exalted through the vaso-constrictor, depressed through the vaso-dilator fibres, which connect them with the brain and cord.

Physiological Action of Fuchsine.—It has recently been discovered that the aniline dye known as fuchsine, or magenta, is largely employed by dishonest wine-growers in France for improving the colour of claret, and masking its dilution with water. Unpleasant symptoms have been observed to follow the use of this medicated beverage; and MM. Feltz and Ritter have accordingly made some experiments in order to ascertain how far the added colouring-matter ought to be blamed for them (*Comptes Rendus*, 26 Juin, 1876). They found that half a gramme of fuchsine in solution, taken on an empty stomach, caused deep redness of the ears, intense itching of the mouth, and slight swelling of the gums. The wine was stained of a deep red colour. When the dose was repeated day after day for a fortnight, diarrhoea and albuminuria were developed in addition to the above symptoms. When fuchsine was injected into the stomach or the veins of a dog, it produced effects similar to those observed in the human subject; when the dose was sufficiently large or frequently repeated, albumen invariably made its appearance in the urine; and this symptom was found to be due to a peculiar degeneration of the cortical substance of the kidneys.

Apparatus for Artificial Respiration.—M. Woilley has devised an instrument which he calls a *spirophore*, for resuscitating drowned persons and warding off the risk of death by asphyxia in certain diseases (*Comptes Rendus*, 19 Juin, 1876). It consists essentially of a metal cylinder, closed at its lower end, and large enough to contain the body of a full-grown man. The upper end of the cylinder is closed by an elastic india-rubber diaphragm, with a hole in the middle, through which

the head of the patient projects. The interior of the cylinder is then partially exhausted by a sort of air-pump; with each stroke of the piston the chest of the patient expands, his diaphragm sinks, and air rushes into his respiratory passages. One advantage of this method of performing artificial respiration is that the air is never forced into the lungs under a pressure higher than that of the atmosphere; there is no risk of damage being inflicted on the delicate pulmonary tissues, as sometimes happens when insufflation is resorted to. Experiments on the dead subject showed that the average amount of air introduced at each inspiration was nearly twice as great as that drawn in during ordinary breathing. The main objection to this ingenious contrivance lies on the surface; it is not likely to be at hand when wanted, and cannot therefore compete with methods of artificial respiration which, like those of Marshall, Hall, and Silvester, require nothing more than a certain degree of skill and readiness on the part of the bystanders.

Variations of Intracranial Pressure.—By placing the interior of the skull in communication with one of Marey's tympana and writing levers, M. Salathé has succeeded in obtaining a graphic record of the periodical oscillations of intracranial pressure (*Comptes Rendus*, 19 Juin, 1876). These oscillations, synchronous with the respiratory movements, are slight during quiet breathing, and very considerable when there is muscular agitation. Their usual order is inverted when artificial is substituted for natural respiration, the pressure rising during inspiration and sinking during expiration. Besides the respiratory waves, a secondary series of oscillations, synchronous with the heart's contractions, are likewise recorded by the liver. Changes in the position of the body were found to exert a very marked influence on the intracranial pressure. Similar results were obtained by applying a modified form of cardiograph to the forehead of a man who had been deprived, years before, of a portion of his frontal bone by an accident, and whose brain was, therefore, protected only by the soft parts. The tracing showed the respiratory and cardiac waves very distinctly, the latter being markedly dicrotic.

CHEMISTRY AND MINERALOGY.

Daubréilite and Daubréite.—These two new mineral species have recently been found, and named in honour of M. Daubrée, the one by Dr. Lawrence Smith (*Comptes Rendus*, lxxxiii. 75), the other by M. Domeyko (*Comptes Rendus*, lxxxii. 922). The former is a brilliant black mineral, coating, and in some cases traversing, the nodules of troilite of certain meteoric irons. Although it resembles chromite in appearance, it is soluble in nitric acid, and is chromium monosulphide, having the composition:—

Chromium	62.38
Sulphur	37.62
	100.00

The discovery of this new body is of great interest in extending the knowledge already arrived at by aid of the spectroscopic of the distribution of chromium in cosmical bodies. The daubréite of Domeyko is a bismuth oxychloride of the form $(\text{Bi}_2\text{O}_3)_4 \cdot \text{Bi}_2\text{Cl}_3$, which has been found in the bismuth mine of Constancia, in Bolivia.

Roscoelite, a Vanadium Mica.—A well-marked species of mica, occurring in a gold mine, at Granite Creek, El Dorado County, on the western slope of the Sierra Nevada, and containing a considerable percentage of vanadium in varying degrees of oxidation, is described by Mr. Blake and Dr. Genth (*Amer. Jour. Sc.* [3] xii. 31). The crystals have a dark clove-brown to greenish-brown colour, and frequently form stellate or fan-shaped groups. The vanadium appears to be present as $2\text{V}_2\text{O}_3 \cdot \text{V}_2\text{O}_5 = \text{V}_4\text{O}_{11}$, and in this form constitutes from 20 to 22 per cent. of the mineral.

—**Psittacinite**, which takes its name from the siskin- or rather parrot-green colour of the films in which it occurs, is also described by Genth. It is a hydrated vanadate of lead and copper, having the formula: $3(3\text{PbO}, \text{V}_2\text{O}_5) + 3\text{CuO}, \text{V}_2\text{O}_5 + 6(\text{CuO}, \text{H}_2\text{O}) + 12\text{H}_2\text{O}$. It is found, associated with gold, and small quantities of cerussite, chalcopyrite and limonite, on quartz in several of the mines of the Silver Star District, Montana.

Aspartic Acid.—W. von Knieriem has noticed (*Med. Centr. Blatt*, xiv. 254) that if a large quantity of gluten be exposed to the digestive action of the pancreatic juice, and the peptones, leucine, and tyrosine having been removed, if the liquid then be boiled with copper hydrate, that a considerable quantity passes into solution, in which solution the presence of aspartic and glutaminic acid can be detected; and he has confirmed this result by an analysis of these acids. The author has shown that aspartic acid, when introduced into the system, is converted into urea, and he regards aspartic acid as the normal intermediate product in the formation of urea.

Greek Glass.—Landerer has recently published (*Berg. und Hüttenm. Zeitung*, xxxv. 189) an interesting paper on the composition of the glass found in Greek tombs. He states that it is a soda and potash glass containing much lead oxide. Many of the darker specimens, of a deep green or blackish-brown hue, appear to be volcanic glass, formed, it is believed, from the obsidian of Thera-Mylos; these, however, also contain lead oxide, which has probably been added to make the glass run more readily. A yellow opaque glass appears to owe its characters to alumina mixed with iron oxide. A blue glass contained copper oxide, which may have been produced by the addition of malachite.

WE had occasion a few weeks since (see ACADEMY, June 17), to direct attention to some imperfections in the method of arrangement of the Loan Collection of Scientific Apparatus at South Kensington (*Sections XIII. and XVII., Chemistry, Mineralogy, &c.*), and to some of the blunders in the first edition of the Catalogue. In the second edition, which has recently been issued, the greater part of these errors have been rectified; the additional matter, however, which has been incorporated in the new edition, and swelled it considerably, is very incorrect. While the collection may be justly styled scientific, that term cannot be applied to the method in which the objects are classified in the catalogue, and many of the blunders are of such a character that it is hard to conceive it possible that they could escape the notice of a printer's reader, still less that they should pass unchallenged the scrutiny of a scientific editor. Why, it may be asked, are apparatus for demonstrating the physical properties of steam and the steam-jet placed among apparatus for teaching mineralogy? Why are the original tubes containing gases liquefied by Faraday placed in Section XIII. (*Chemistry*), while his Laboratory Note Book, recording the results of his valuable researches on the condensation and liquefaction of these gases, is to be found 300 pages off in Section V. (*Molecular Physics*)? Why are silicates employed for optical purposes, in each case incorrectly described as "compounds of silicon with various metals," classified in one instance under Section VII. (*Light*), and in the other under Section XI. (*Astronomy*)? And on what principle could such a classification, even if it were faultless, include "crystallisation of alumina and magnesia" and "plate of crystals of aluminium." And how does it happen that another specimen is described as an "aluminate of silicium and magnetism"? Why, moreover, is a photograph of a "Wild's Polaristrobometer" exhibited in Section XIII. (*Chemistry*), and the instrument, described as a "Wild's Polari-Strobometer," placed 350 pages off under Section VII. (*Light*)? One feature of the new edition is the incorporation of a number of foreign collections of chemical compounds and

apparatus. Such a special collection, sent from Berlin, is one stated, on the authority of Prof. Hofmann, to consist of substances of which Liebig was the discoverer. They are nearly one hundred in number, and we find them, on a superficial inspection, to include formic acid, asparagine, butyric acid, cane sugar, stearic acid, tartaric acid, urea, uric acid, creatine, atropine, caffeine, cinchonine, morphine, narcotine, nicotine, piperine, valeric acid, &c., none of which were "discovered by Liebig" as stated on p. 523. Four pages further on four salts are described each as a hyposulphite: if they are so, the formulae are wrong; if the formulae are correct, which the varying amounts of water of crystallisation would lead us to believe, each salt is a hyposulphate (dithionate). The Berlin Gas Company exhibit bicarbonate of ammonia found "in the gas-discharge pipes of hydraulic machines." From what follows this statement we are led to believe that "the hydraulic main" is here referred to. In printing the names and addresses of the contributors the same want of accuracy has been shown, and so we read of the "Physical Institute of the University of Freiberg, Baden." In many cases the foreign names of pieces of apparatus have not been translated at all, although an English equivalent is to be found without difficulty: we meet, for example, with such words as "étuve," "stativ," "bobine," &c.; others again which have been rendered into English are not in the form familiar to the man of science: such are "charcoal sticks" for carbon points, "effective substance" for active principle, "Grove pile," "chroites crystals," "rhomboid of Iceland spar," &c. The mode of rendering other scientific terms in common use in England is equally unhappy, and of these we may instance "atterism," "apparatuses," "a chemical harmonica," and "Spee-gear, bottle in case," whatever that may be; while the term "pantigraph" is still retained in the Introduction. The blunders appear to be impartially distributed over the various sub-sections: while we have "wolfram phosphide," "silicon-calcium," and "molibdate of lead," on the one hand, we meet with "Kemala" and "Sabor-andi" on the other; and among the rocks and minerals, "Trooshte" for troostite, "dimyte," repeated, for dunite, "Garnet fils," "Rosed fel-syte," "Hokscharowite," &c. Finally, we will confine ourselves to directing attention to about a dozen of the errors in the names of persons which we have met with during a superficial examination of this revised edition of the Catalogue:—"Andrew" for Andrews, "Berzélius," "Bilstein" for Beilstein, "Cloës" for Cloez, "Sir Humphrey Davy," "Eisenrohr" for Eisenlohr, "Erltenmeyer" for Erlenmeyer, "Fritzshe," "Kakuli" for Kekulé, "Rutlerow," "Rudnen" for Rudneff, "Schick" for Schiek, "Siemgan" for Siemens, "Smith" for Smithson, and "Wrohlesky" for Wroblevsky.

PHILOLOGY.

PROF. NISSEN has just published at Berlin a monograph on six newly-found leaves of a manuscript of Ammianus Marcellinus. They contain xxiii. 6 *cremat. et si aqua potiri bonis omnibus*; xxviii. 4 *quod et in maiores*—xxviii. 6 *rogaretur adfectis nonnisi abun*—, with the loss in two places of seven lines each; xxx. 2 *qua regressa aduenit surena*; xxx. 4 *potestatis negotiorum examina spec*— They were discovered by Gustav Koennecke at Marburg, whither they had been brought from Cassel some years before. They had been used to cover certain *acta* (? registers of accounts) drawn up by the comptrollers of the castle of Friedewald, about seven miles from Hersfeld, in the years 1584, 1585, 1586, 1589. Nissen concludes, no doubt rightly, that they belonged originally to the *codex vetustus*, formerly in possession of the abbey of Hersfeld, which Gelenius used for the 1533 edition of Ammianus, and with which the Fulda codex brought to light by

Poggio, and now in the Vatican, No. 1873, can alone claim equal antiquity. The Marburg fragments (of which a photographed specimen accompanies Nissen's monograph) are assigned doubtfully to the years 900-1100 A.D.; and the same authorities agree in considering them to be earlier than the Vatican MS. If this is true, they represent the earliest tradition of the text of Ammianus at present known; and it is most regrettable that Koennecke's researches in the neighbourhood of Hersfeld have failed to unearth any more leaves.

In the *Hermes*, vol. xi. part 2, Bernays ("Politianus und Georgius Valla") shows, with characteristic learning and acuteness, that Joannes Lydus was known to Politian, and traces to its source in the Prolegomena to Porphyry's *Eisagôgê* the story of the last words of Archimedes, τὰν κεφαλὰν καὶ μὴ τὰν γραμμὰν. R. Hirzel has a short but interesting essay on the philosophy of Alcmaeon. Pack ("Der Heilige Krieg im 16ten Buche Diodors") argues that Diodorus in a large part of his account of the Sacred War followed Demophilus. Important critical matter is contained in the articles by Schöll on the Palatine codex of Lysias and the Medicean of Aeschylus; by R. Neubauer, "Epigramme aus den Ephebengymnasium;" and by Hercher on a number of passages in Greek prose writers. The main contributions to Latin scholarship are Hirschfeld's second article on the Fasti Capitolini, Gemoll's essay on the fragment "De Munitionibus Castrorum," and Gruppe's on the relation of Manilius to Varro. Breysig contributes notes on Avienus.

In the *Rheinisches Museum*, vol. xxxi. part 2, C. Curtius publishes for the first time some Athenian jurymen's tickets in the Berlin Museum. There are two articles on the Latin anthology by Peiper and Baehrens. L. Mendelssohn contributes an important paper on the criticism of Apian. Seeliger discusses the law of inheritance quoted in the *Makartatea* of Demosthenes; Dziatzko, the *Andria* and *Perinthia* of Menander. There are also interesting essays by Schreiber on the authorities used by Pliny for his lists of works of art, and by Wellhausen on the progress and present condition of the science of interpreting cuneiform inscriptions.

FINE ART.

On Restoration. By E. Viollet-le-Duc. With a Notice of his Works in Connexion with the Historical Monuments of France, by Charles Wethered. (London: Sampson Low & Co., 1875.)

THE first part of this book is a translation of an article in the eighth volume of the *Dictionnaire raisonné de l'Architecture Française*, published in 1866. The translation is well done, but unfortunately the article selected is probably the only important one in the Dictionary which will convey no useful information to English readers. The doctrine taught by M. Viollet-le-Duc is that propounded by the leaders of the English Gothic movement twenty-five years ago, the unsoundness of which is only now being very slowly recognised here. There is much that is very just and true in what M. Viollet-le-Duc says, but all is vitiated by the idea of *restoration* which pervades it. "Every building and every part of a building," he tells us, "should be restored in its own style." What this means at home we know only too well, and the French exaggerate its interpretation. A building with associations stretching back over a thousand years, and which carries in its fabric its history for seven or eight hundred,

is by restoration made a thing of to-day. The works of the last three centuries are wholly and entirely wiped out, and the sort of respect which is shown to earlier works does not prevent their wholesale destruction to make way for modern imitations. The old building is gone, and in its place we have a full-sized model of what the restorer thought it or its parts might or ought to have been when new. The restorer may be a very learned archaeologist and his model very excellent, but it cannot compensate for the loss of the original. It cannot be too often or too strongly insisted upon that our duty towards an ancient monument is not to restore it, but to preserve it; not to take from it its traditions, but to continue and, if need be, to add to them. An old building still in use—a church, for example—will require repair and occasional alteration to suit the changing wants and tastes of its users, and these works should be in complete sympathy with the old, but should not attempt to imitate it, or make believe to belong to any period other than their true one. We are not advocating careless or reckless alterations. To know what to preserve and how to alter requires more archaeological learning and more thought and taste from the architect than does the more popular process of restoration.

M. Viollet-le-Duc does not attempt to justify restoration. He begins with a defence of the study of mediæval work (which may still be necessary in France, although here it is difficult to persuade architects to study anything else), and thence he quietly passes on to restoration as if it were a necessary consequence of that study. We did the same in England a quarter of a century ago, although even then we had a few good men, like the late Mr. Petit, sufficiently enlightened to see and point out the error and to protest against it.

To the translation Mr. Wethered appends an article of his own, which he would have been well advised to have omitted. We can understand and, to a great extent, sympathise with his admiration for M. Viollet-le-Duc, and for that very reason the more protest against his fulsome panegyric. M. Viollet-le-Duc's literary and archaeological labours have our fullest respect, and we much wish that we possessed English parallels to his two great dictionaries; he may be *facile princeps* among the Gothic architects of his own country, but we cannot forget that even the best modern French Gothic work scarcely rises above the level of the Manchester School among ourselves. The personal part of the story is far too personal, and will scarcely please its hero, if it ever reaches him. Would the writer have written in the same way of a living English celebrity? Mr. Wethered's standpoint for architectural criticism may be gathered from what he says about Notre Dame at Paris. He commends the black pointing of the masonry, calls the painting of the chapels "exquisite," and tells us that "there has been no scraping of the surfaces of old stones; in all cases wherever un mutilated they have been left untouched." What a large number of "mutilated" stones there must have been before the restoration! J. T. MICKLETHWAITE.

THE RE-OPENING OF THE NATIONAL GALLERY.

BEFORE this is in the reader's hands, the National Gallery will be again open. Much has been done during the months while it was closed. The group of new rooms in the rear of the building, designed by Mr. E. M. Barry, has been at last finished, and thrown into communication with the old rooms in the front. The hanging space at Trafalgar Square is thus nearly double what it was; and not only have the collections been wholly re-arranged in consequence, but large additions have been made to them. The Vernon collection has been brought over from South Kensington, and hangs in four of the old rooms west of the entrance. The Wynn Ellis bequest has been sifted, and the hundred and odd pictures chosen from it hang by themselves in the last of the old rooms east of the entrance. One room has been filled with a selection from the drawings of Turner. So that it is a National Gallery altered and enlarged, not only in dimensions but in contents, which will this week be thrown open to public curiosity.

To speak first of the accommodation—ours is certainly not an ideal National Gallery; but then, neither has any other nation got an ideal gallery, nor is it easy to determine what would be the ideal for the purpose. So far as concerns simply the purpose of exhibiting pictures, the best gallery would be one broken up into many sky-lighted chambers of very moderate size and the simplest possible decoration. In each of such chambers the pictures either of a single master, or of a single group of closely allied masters, should be hung with plenty of space between them on the wall, so that no picture might injure its neighbour, and the works of the master or the group might be studied in their mutual relations without the intrusion of distracting impressions. But this ideal is not well compatible with architectural dignity; and the very name of a National Gallery implies that it should possess architectural dignity—the dignity of a great national structure. So, at least, it is assumed, and architects on their part take care to enforce the assumption. The old galleries of Trafalgar Square, indeed, were pretty strictly adapted to the single purpose of setting off pictures. The system of lighting—by lantern lights above a perfectly plain coving—was excellent, and the rooms, with one exception, were not too large for the comfortable exhibition of some one connected group. The walls used to be lamentably overcrowded, and, even since the changes, are overcrowded still, but otherwise those modest galleries were well contrived enough. However, it has been the fashion to call the work of Wilkins mean and paltry; and Mr. Barry has only done according to expectation in attempting something grander. His additions consist of an octagonal dome-room, with four oblong rooms, or vestibules, opening out of it towards the four points of the compass, of which the south vestibule communicates with the old galleries; the east, with a great new hall in which are hung all the Rembrandts and Rubenses; the north, with a still longer hall filled with the great Italians of the *cinquecento*; the east vestibule is closed. This plan of great halls a hundred feet long or more excludes, of course, the separate groupings of which I have spoken; but it gives, from the architect's point of view, dignity. The new octagon and vestibules are not too large, however, to have made, by their dimensions, capital exhibiting rooms. But, unfortunately, here also architectural effect has been studied, and the consequence is disastrous to the effect of the paintings. Lofty domes or vaulted ceilings of ground glass let down an unsatisfactory light upon the walls. In the octagon, a floor of light-coloured marbles throws up a reflection ruinous to those pictures which, as all valuable pictures in London ought to be, are under glass. Much worse yet, the cornices above the pictures has been heavily gilt, and above the gilt cornice great spaces of

vaulting and coving and lunette have been filled with tasteless and obtrusive decoration. It is almost impossible for a spectator in the octagon, under the pressure of this tawdry canopy, this world of gilded and tinted and moulded panelings in strong light over his head, with four huge, ill-carved bas-reliefs let into the four lunette-spaces that look down upon him—it is almost impossible for him to fix his attention upon that to which alone attention should be called. We shall probably hear much of the magnificence of all this. It is not magnificent: it is pompous, ill-conceived, and absurd. If architecture we must have, let it be architecture less flagrant than this. The former paltriness was better than the present grandeur. Inasmuch as the changes give us double space, let us be heartily thankful; but let us acknowledge, before the verdict of Europe tells us, that for architectural dignity they give us the worst kind of architectural pretension. And now to the pictures themselves.

The task of wholly re-hanging this great collection, which has fallen in the last months on the Director and Keeper, must have been a task of many problems and much fatigue. The doubled space is still insufficient. The necessary endeavour to maintain something like symmetry in the distribution of pictures, especially on the walls of the great new rooms, has conflicted, inevitably, with the endeavour to place the works of one master or one school with something like strictness together. But the result, considering the conditions, is very admirable. For the first time we can see what we have got, and nothing is too far from the eye. I propose merely to put down, for the information of readers of the ACADEMY, the general order of arrangement, and a few of the general impressions of a first walk taken among the familiar treasures with their new additions and in their unfamiliar order. In old days one used, coming upon the landing, to find oneself first of all among the primitive Italians. The Italians have left all this part of the building now, and it is given over to our own countrymen. In order to take the English pictures in historical order, let us begin with what used to be the third room on the right from the landing—the room where Perugino's altar-piece used to hang, and Bellini's *Peter Martyr* and *Doge Loredano*. This now contains the English masters of the eighteenth century by themselves. The series of Hogarth's *Marriage à la Mode* hangs on one wall under Gainsborough's great group of the *Baillie Family*. On another, Gainsborough's *Watering Place* is flanked by his *Mrs. Siddons* and *Parish Clerk*; and here are Reynolds's *Lord Heathfield*, and his *Infant Samuel*, and the cluster of singing heads; a choice and lovely assemblage, but far too small, from the best days of English art. In the narrow room behind this, where the Labouchere Michelangelo and the Garvagh Raphael and the *St. Cecilia* used to hang, are placed the historical pictures of that manly and interesting artist, Copley. Moving westward, we enter the long gallery formerly occupied by the masterpieces of the mature schools of Italy: this is now entirely hung with the oil-pictures of Turner. The water-colour drawings of the same master, including the set for the *Liber Studiorum*, fill, with a few of his oil-paintings, the next room also—that which used to belong to the Italians of the fifteenth century, Pollaiuolo, Botticelli, Crivelli, and so forth. In no public gallery is there so vast a display of the works of one master as here of Turner. The narrow room behind this, next the landing, contains, on the south wall, West's large *Christ Healing the Sick*, flanked by Lawrence's full-length portrait of Mrs. Siddons, and Barker's *Woodcutter*; besides Haydon's *Mayday*, John Martin's *Pompeii*, and a company of Smirkes. Still walking from east to west, the next room has a miscellaneous choice of figure and landscape, partly from the Vernon gallery, partly from the previous collections in Trafalgar Square, by the artists of the earlier years of the present century.

Here is an admirable early Calcott—the *Old Pier, Littlehampton*; here are three Cromes, including the noble *Mousehold Heath*, and the upright picture, different in dimensions but somewhat similar in character and feeling, which was bought at the Watts Russell sale last year; and Constable's *Cornfield* and *Valley Farm*; two masterly little Nasmyths; three Stothards, one of them the rich and successful little Titianesque cento called *Nymphs Bathing*; five familiar Wilkies; and an architectural piece and a battle-piece of Jones, sometime soldier and presently Academician. In the next gallery, Ward's enormous piece of the *Alderney Bull and Cows* hangs surrounded with works principally of later date—with the elegant compositions of Eastlake, the most accomplished of critics and least original of painters; with the well-known things of Mulready, Etty, Leslie, and their contemporaries. The next room, the easternmost of the old suite—what used to be the Turner room—carries the history of the school on a little later yet. Here are the works of painters so lately dead as Landseer—*Wellington on the Field of Waterloo*, the *Comus*, the *Peace and War*, the *Maid and Maggie*; and of painters still living such as Mr. E. M. Ward—*The South Sea Bubble*, *James II. Receiving the News of William's Landing*, *Dr. Johnson in the Ante-room of Lord Chesterfield*; of Mr. Frith—*The Derby Day*; and Mr. Armitage—*Judas* and the *Pharisees*, presented by the painter.

It is something of a shock, at first, to find this series of our own later painters on walls where we had been accustomed to look for their greater predecessors. Still that a historical series of the English school should find its place in the English National Gallery is evidently a right and proper thing. Only, what one feels is that this series betrays too much the casualness of its origin. Brought together by no systematic selection, but by accidents of bequest and gift, including the one preponderating Vernon bequest, it represents our school disadvantageously. Our great time, from 1740 to 1790, fills but one small room. We want more of Hogarth, more of Gainsborough, very much more indeed of Reynolds; while Romney, that prolific and delightful master, is represented by the single sketch of Lady Hamilton. We have too little, in a word, from that excellent period of native art which ends with Morland, and too much from that period, in so many things melancholy and mistaken, which begins with Wilkie and has not fairly ended yet. It is painful to learn from so many reiterated examples how the diligence of a draughtsman like Mulready, and the power of a colourist like Etty, availed them nothing; how the idylls of the one, and the mythologies of the other, are infected by the same spirit of laboured triviality and hopeless commonness. Of the most vigorous and refined tendencies of recent or living art this collection has no examples. It is right that the weakness, the exaggeration, the vulgarities of our school should be exhibited, but its strength ought to be exhibited in fair proportion. To redress the balance systematic care should henceforth be taken in the purchase of English pictures; or better, may we not hope that the more judicious munificence of some future collector may endow us with the best our school has done?

To find our way now among the re-distributed foreign schools, let us go back to the eighteenth-century room, from which we started. In the room next to the east of that are hung the pictures of the French school. In these we are very poor, and one longs for a choice, say, from the vast collection of Sir Richard Wallace, in order that France may have something like her due. Recognising Claude le Lorrain among the French school, the authorities have, as in duty bound, hung in the same place with Claude the two pictures painted by Turner in rivalry of him; but even so the room is not over full. Through an opening broken into the north wall of this room we pass into the south vestibule of Mr. Barry's

great new annex. Here are hung the Spanish pictures, so thinly upon the walls as to remind us that this is another great and busy school of which we have far too few examples; but yet closely enough for pleasure in study; we wish we could afford for all other schools as much space in proportion. Passing hence into the octagon, we find ourselves, for the first time, among the Italians. There is not much hanging space, nor, as I have said, can the pictures be very well seen, in this room; so that the authorities have done wisely in choosing nothing quite of the first rank for exhibition here. Garofalo's enthroned *Madonna*, Parmigiano's *Vision of Jerome*, Bramantino's *Adoration of the Magi*, hang each above one of the interesting and animated set of little pictures ascribed, but surely without sufficient reason, to Pinturicchio, which were bought at Mr. Barker's sale. On the left opens the west vestibule, devoted to the primitive Italians, from Margaritone in the middle of the thirteenth century to Uccello at the beginning of the fifteenth. The north vestibule is given to a selection of examples the most perfect in themselves, and needing to be seen the most perfectly, chiefly from the Italian sixteenth century; Van Eyck's splendid portrait of John Arnolfini and his wife is an exception that does not look out of place beside the masters of Venice, who learned from the masters of Bruges so many secrets of their craft. On the right-hand wall Titian's *Bacchus and Ariadne*, in a good light and looking more glorious than ever, hangs between his *Noli me Tangere* and Bassano's *Good Samaritan*. Opposite, the unfinished *Deposition* of Michelangelo is flanked by Raphael's *St. Cecilia*, the Garvagh Raphael, the noble Solario portrait bought last year, Andrea del Sarto's portrait of himself, Bellini's *Doge Loredano*; while the Labouchere Michelangelo hangs, a little too obscurely, in the corner. Then we advance into the great north gallery, which runs at right angles to this vestibule. Admitting that great halls are desirable, and putting aside the unpleasant effect of the decorations, the pageant here is noble in the extreme. The peculiar distinction of the National Gallery—the traditional distinction, it may almost be said, and one which the present administration is doing its utmost to keep up—lies in the determined choice of acquisitions which, if they have suffered, have suffered from decay and not from renovation. Assuredly no other room in the world contains so many great pictures so nearly in the state in which they left their painters' hands. The mighty Sebastian del Piombo, which holds the central place, is blackened indeed—irrecoverably perhaps—and looks even blacker than in its former station. But the general multitude is one of masterpieces which have suffered little, some of them not at all. On either side of Sebastian's *Lazarus* hang two perfect Titians, one the familiar *Madonna and Child with St. Catharine*; another, that *Holy Family with a Shepherd Adoring*, bequeathed long ago by Mr. Carr, which used to hang high and look obscure, but now, brought down and cleaned with a scrupulous and sparing hand, proves to be in faultless preservation and has all the value of a new acquisition. Close by to right and left hang what are really new acquisitions—two out of the four portraits purchased the other day from the Fenaroli Gallery at Brescia. One of these is by Moretto, and fit to take rank with that sumptuous portrait of Count Sciarra Martinengo which has long been one of our best treasures. The full-length figure of a young man with a short beard leans with his elbow on a ledge of architecture, and wears that peculiar expression of longing outlook, that stately melancholy of sentiment, which are common to the portraits of Moretto and Lorenzo Lotto. The black quilted jacket, the brown slashed sleeves and brown hose, the grey stained column, and corner of noble landscape high up on the right, are of perfect finish and perfectly subordinate to a

faultless head and hands. The pendant, also new, is a full-length of Moroni, who was no harmonious idealist like Moretto, but above all things a forcible master of individual character, and a noble colourist, chiefly in tones of black and grey. In the present picture, the subject stands before a wall in a dark suit, with pieces of dark armour strewn upon the ground. The third of the new pictures is the portrait of a lady, not interesting in character of head, but of great force and beauty in the painting of her red and amber-coloured clothes. The fourth is a half-length of immense force and individuality, of a brown-bearded man of law in a black suit. Altogether, this acquisition of Brescian portraits is an excellent one. At the western end of this gallery, Veronese fills the central place with the *Family of Darius before Alexander*; to right and left are the scowling gold-haired beauty of Paris Bordone, and Moretto's Count Sciarra Martinengo aforesaid. Along the south wall are ranged old friends one after another—the *Ecce Homo* and *Venus and Cupid* of Correggio, the *Madonna* of Beltraffio, the superb three-divided altar-piece of Perugino, the Francias. Passing by the Borgognones on the west wall, we come into a square room, in which are hung, a little confusedly as it seems to me, the beloved masters of Italy's learning and expanding age; the Crivellis—a complete gallery of that grim master—the two precious Piero della Francesca panels, the things of Botticelli, Lippo Lippi, and the rest. Then we turn to the right, and enter a second long gallery at right-angles to the first. Here are the pictures of the Bruges school, except Van Eyck; there are goodly ranges of Rembrandt and Rubens. This gallery communicates on the right with the central octagon by way of the east vestibule, to which has been transferred the Peel collection, already familiar to us, of Dutch pictures.

Passing by this, and coming out at the south end of the Rubens and Rembrandt room, we find ourselves back again in the old galleries, in the end room next St. Martin's Church. This is filled with the Wynn Ellis collection. The only old Italian things worth mentioning here are a Florentine fragment in tempera, injured but very lovely, of an adoring angel, and a carelessly-drawn Venetian pastoral of some far-off imitator of Giorgione. There is, indeed, a Canaletto, the most animated and perhaps the most important in existence, showing the Maundy Thursday procession in the piazza outside San Rocco. Among the earlier Netherlands there is a version—the most quaint, strained, and grim of all—of the famous and often-repeated *Money-Changers* of Quintin Matsys; and there is a small and precious portrait—grave, tender, and a little prim in feeling and handling—said to be of Memling by himself. But the great riches of the collection are in the Dutch school proper; Teniers the elder and Teniers the younger; Cuyp; Wouvermans—a hunt, with a background of misty pool, valley, and mountain, highly wrought in exquisite tones of silvery grey; cows by the one Vandewelde, and ships at sea by the other; ships at sea by Vandecapelle; airy and spacious landscapes by De Koning; black and lowering ones by Ruysdael; a Hobbema of branching trees, and cottages in the clear shadow of open glades; a masterly study of imaginary marble architecture by Dirk van Deelen; two, more masterly still, of real brick architecture by Van der Heyden. Between the Peel purchase and this new bequest we are now as rich as it is possible to desire in perfect examples of Dutch seventeenth century handicraft.

Adjacent to the Wynn Ellis Gallery on the right is the only room of the old suite into which we have not yet been. Here are placed the late and decadent Italians—the Caracci, Guido, Barocci; but among them a picture which, if room could have been found for it in the north gallery, ought certainly to have gone there: I mean Veronese's noble *Adoration of the Magi* from the church of

San Silvestro at Venice. And so we bring to an end our hurried walk, if with no increased respect for our capabilities in public works, yet with an increased sense of the splendour of our public possessions, and with much gratitude to those who have newly set them in order.

SIDNEY COLVIN.

NOTES AND NEWS.

WE hear that the long-delayed volume by Mr. Drury Fortnum on the European bronzes in the South Kensington Museum may be shortly expected.

MR. NESBITT is at present engaged in preparing his volume of the same valuable series of descriptive catalogues, the subject being Glass of all times and countries, more particularly referring to the examples in that museum.

MESSRS. SIMPSON AND SONS have had on view at their premises, No. 100 St. Martin's Lane, a series of decorative tile-paintings from the history of Elijah, to be placed on the peristyle of Cardiff Castle, the seat of the Marquis of Bute. The designer of these works is Mr. H. W. Lonsdale; Mr. Burges being the architect in charge. Mr. Lonsdale's designs are reasonable, creditable works, not exceeding either in archaic stiffness or in anti-architectonic laxity. The tile-paintings are, as facsimiles of the designs, excellently true; all contours and all tints being reproduced with diligent and unflinching precision. There are a great number of tasteful and well-invented, and a still greater number of skilfully-executed, works of decoration in Messrs. Simpson's show-rooms—painted tiles, stained glass, metal work, &c.—and a good idea of certain phases of our art-activity at the present day may be obtained from looking over the stock.

LOVERS and collectors of Rembrandt's etchings will be interested to hear that a new edition of Wilson's Catalogue has been for some time past in preparation. It is well known that the descriptive catalogue published in 1836 is far from perfect, especially in regard to the definition of the various states. M. Charles Blanc's charming volume published in 1859 has not entirely remedied this defect, and the Rev. O. H. Middleton, who has undertaken the task of preparing the new edition of Wilson, will find much still remaining to be done in order that the catalogue may be made entirely worthy of the master. The kind of devotion needed to perfect a labour of this kind is exceedingly rare, but among all amateurs of Rembrandt the result is sure of full recognition. Mr. Middleton has made the plan of his research sufficiently wide to embrace all the important collections, both English and foreign. Besides devoting particular attention to the various states, he will add notes upon the deceptive copies that have from time to time appeared. The numeration adopted by Wilson will be followed, not because it is the best, but because so many of the most valuable English collections are arranged after it, and because it has been followed by the majority of English writers who have referred to Rembrandt. In the prosecution of his labours it is needless to say that Mr. Middleton has made ample use of the splendid Rembrandt collection in the Print Room of the British Museum.

AT the recent sale of Mr. Rose's collection of prints some important examples were secured by Mr. Reid for the national collection. Among perhaps the most curious is a portrait of Queen Elizabeth nowhere described, and signed by an artist whose name does not appear in any list of engravers. Johannes Rutlinger has not found a biographer, but it is evident from this work alone that he was by no means wanting in artistic power. The characterisation, as expressed both in the face and in the action of the hands, is strong and decided. The lines are few, but they are stamped with an individuality that leaves no doubt as to the veracity of the portrait. In com-

paring the face with other parts of the composition there is found some ground for the suggestion that the work was left incomplete. Portions of the jewelled costume are highly elaborated and engraved with greater depth and variety of tone than has been employed upon the features. The portrait is a half-length, with the left hand resting upon a table and holding a fan of ostrich-plumes. It is just possible that a copy of the print might be found among the Royal portraits at Windsor, and it would be interesting to learn from Mr. Holmes whether such is the case.

ART and literature are both represented in the new American Embassy. Mr. William J. Hoppin, the chief secretary to the Legation, who arrived in England at the end of June, is not merely an accomplished lawyer, but is also well-known to American readers as a cultivated and serious art-critic. He has been for some time a notable contributor to the *Atlantic Monthly Magazine*, and he is now writing in *L'Art* a very interesting account of the present state of American art.

THE twenty-seventh Annual Report of the Council of the Arundel Society has lately been published. It is satisfactory to learn that the financial prosperity of a society that has for its object the "promotion of the knowledge of art" is increasing. The report for 1874 told the other way, but it seems that this was only a temporary falling off, for the gross receipts of 1875 amount to 7,187*l.*, a larger sum than has ever before been known in the Society's history, except in 1872, a year which has always been noted as exceptional. The chief source of profit appears to lie in the sale of what are called *Supernumerary* and *Occasional Publications*. The sale of the latter alone amounted to 1,156*l.* last year, against 478*l.* the year before. This great advance was doubtless owing to the publication of three new chromolithographs, one of which, *The Meeting of Mary and Elizabeth*, by Mariotto Albertinelli, was so extremely popular that it produced 380*l.*, a sum more than sufficient to "repay in a single year," we are told, "the entire cost incurred, both in 1874 and 1875, upon its preparation." The number of new members also, which in 1874 was only 126, rose last year to 150. Altogether, indeed, the results of the year are encouraging, although it is owned that the increase of income was not gained without a "more than equivalent increase of expenditure." This, however, is stated to be no cause for dissatisfaction, as it only results from the unusually large sum expended under the head of the Copying Fund, a mode of expenditure that must necessarily be gradual in yielding returns. Water-colour copies were made last year of no less than ten important Italian paintings, and of a small triptych by Mabuse in the museum at Palermo. Several of these works are now preparing for publication, and the council are so satisfied with them that it has been resolved to give further commissions to the artists, Herr Kaiser, Signor Fattorini, and Herr Schultz, for copies of various other works this year. Herr Kaiser will resume his work at Assisi, and will afterwards probably visit Siena for the purpose of copying the remaining fresco by Bazzi, of the *Visions of St. Catherine*. Signor Fattorini has been commissioned to make a drawing of Pinturicchio's *Nativity* in S. Maria del Popolo at Rome, and Herr Schultz is to copy Albrecht Dürer's magnificent painting of the *Adoration of the Trinity* at Vienna.

THE fifth exhibition of the Union Centrale, distinguished by its magnificent display of tapestry, was opened on the 1st of this month at the Palais des Champs-Élysées. Never, certainly, has such a collection of work of this kind been made before. Not only have all the finest pieces of French manufacture been gathered from the Gobelins, the dépôt of the Garde-meuble, and different churches in France which happened to possess remarkable examples, but various foreign museums, such as the Uffizi at Florence, the Royal Museum at Madrid, and South Kensington,

have contributed numerous specimens from their collections. Private collectors and amateurs also have freely yielded their treasures, especially when these have been wanting to fill historical gaps, for, as we have before stated, the exhibition of the Union Centrale aims at presenting a complete history of the development of tapestry from the sixteenth century to the present time. Besides the tapestry, a small collection of pictures and drawings illustrating the history of the town of Paris is exhibited, and the whole series of designs executed for the Commission of Historic Monuments by some of the principal architects of France. Various portions of this collection have been exhibited before, but not the whole series, which comprises as many as 400 drawings from all the chief buildings and historic monuments of France. A number of casts from the most important works of French sculpture executed for the same Commission are also noteworthy.

A CURIOUS confessional, of Italian workmanship of the sixteenth century, and a forged iron pulpit of the same date have just been added to the Cluny Museum. The pulpit, according to the *Chronique*, was obtained from a monastery in the department of Vaucluse, at the price of 22,000 fr.

FORTY-FOUR new plates have been added to the excellent series of photographs taken from the pictures in the Dresden Gallery.

A LARGE and fine piece of Roman mosaic, of elaborate design and in good preservation, has been found at Lyon. It is supposed to have formed the pavement of a room measuring 25 mètres.

THE death is announced in Rome of the Italian painter Prof. G. Battista Canevari, at the age of eighty-seven. He was a member of the Academies of St. Luca and Raffaello, and fought in his youth under Napoleon I.

AMONG Italian painters of the day Ferdinando Folchi may be mentioned as an accurate and conscientious artist, who has been steadily gaining fame for his historical and sacred subjects executed both in oil and fresco. Several of the leading patrician families in Florence have entrusted him with important commissions. Two entire rooms in the southern quarter of the Royal Pitti Palace have been decorated by him; also the large altar-piece of the *Descent from the Cross* in the Church of the Annunciation is his work, and another representing a *Miracle by Saint Francis*, painted for the Church of Santa Maria del Soccorso in Livorno. The work upon which he is at present engaged, for the Church of San Firenze, represents *The Appearance of the Sacred Heart of Jesus to Saint Marguerite Marie Alacoque*. The *Raffaello* describes it as a composition of great merit.

NO ONE at the present day has a better right than Prof. Brunn, of Munich, to pronounce an opinion on the artistic merits of the sculptures recently discovered at Olympia in the German excavations, and it is, therefore, with pleasure that we have received his contribution to a subject on which a good deal has been written in these pages. We may refer in particular to Prof. Colvin's articles (*ACADEMY*, April 15, 22, 29, 1876) written after his visit to Olympia, the more so as Brunn (*Transactions of the Bavarian Academy*, 1876, p. 337) accepts Prof. Colvin's general estimate of the newly-found sculptures as compared with the previously-known reliefs from Olympia in the Louvre. To speak correctly, Prof. Brunn pronounces no opinion on the new acquisitions, because he has neither seen the sculptures themselves nor even satisfactory photographs of them. What he does is to give us the opinion which he had formed and communicated to his students two years ago on the style of the sculptor Paeonios and his relation to Pheidias and the Attic school. Certain of his results have appeared from time to time in the *ACADEMY*, and to

those who have taken an interest in them the fuller explanation now given will be welcome. Compared with the Peloponnesian school of sculpture, which aimed at perfection in reproducing the bodily form of man in all its truthfulness so far as a minute examination of living specimens could go (see the Egrina marbles in Munich), or compared with the Attic school in which the sculptor approached his work with an ideal in his mind which we all know, the school of Northern Greece to which Paeonios belonged was characterised, according to Brunn, by a painter's desire of obtaining a complete general effect with a consistent carelessness in working out details of form in the way in which the strict demands of sculpture require them to be worked out. The demonstration of this peculiarity of style and the theory as to how it grew up in Northern Greece is the most interesting part of the present paper.

THE Cavaliere G. Botti, whose ingenious process for removing and restoring ancient and dilapidated wall-paintings has been successfully applied to several of the great frescoes of the early Italian masters, and has gained him great distinction in Italy, has lately been employing his skill for the preservation of Correggio's fresco of the Annunciation in the Church of the Annunziata at Parma. This fresco, which is believed by almost all authorities to be genuine, is supposed to have been originally painted for a large lunette in the old Church of the Annunziata outside the town, but it was removed from that church as early as 1548 and placed in the then newly-built church of the same name in Parma, where it has remained ever since, though, on account of the dampness of the wall and other evils, it has gradually fallen into a most ruinous condition. The difficulties attending the removal of such works are always very great, but they were increased in this case by the wall on which the fresco had been placed being composed, not of bricks only, but of a mixture of bricks, shells, and small stones, which offered an uncertain surface to the iron blade that Cavaliere Botti passed between the wall itself and the cement on which the fresco was painted in order to detach it from its position. In spite, however, of all obstacles, the hazardous feat of the transportation of this dilapidated work has, we hear, been successfully accomplished. It is to be hoped that, after this happy deliverance from the dangers that were fast threatening to destroy it in its dark damp resting-place in Sta. Annunziata, it will not fall into greater ones in the hands of the restorer. Although the picture has suffered dreadfully from the effects of saltpetre, and is in many parts almost obliterated, the exquisite beauty of the face of the Virgin which was noticed by Tiraboschi is still perceptible, and the wonderful grace of the Angel, who has alighted on earth on a cherub-borne cloud, fully reveals the charming style of the master. These traits would infallibly be lost should the picture be over-restored, or "improved"—the term now applied to work of this kind in Florence. Many of the processes applied for this "improvement" of old paintings in Italy are most destructive. A correspondent tells us that one has just been patented consisting of a solvent which reduces an old picture to its dead colour in ten minutes. "A torpedo," he adds, "is a trifle to it." Cavaliere Botti's process, however, is not so fatal as this. It is principally concerned with the transportation and preservation of old works, and does not, we believe, attempt their improvement. The removal of the Correggio Annunciation was commissioned by the Italian Government, which has employed Cavaliere Botti on many similar works.

THE STAGE.

PLAYGOERS' GRIEVANCES.

A GRIEVANCE of the humbler playgoer, which may well gain a little attention in an empty season, is the outrageous length of time that the

hiner of any unreserved seat is expected to pass in the playhouse before the play begins. The late dinner-hour of society makes it impossible that the important piece which people really go to see shall begin before half-past eight o'clock, but the tradition of the theatre is that the doors shall be opened, and the manager's servants be ready to take the playgoer's money as early as seven. The sooner the tradition is done away with the better, for it clashes with modern habits, and obliges most visitors who do not take a stall beforehand to waste what is probably an hour, and may be even more than an hour and a half. For if the important piece of the evening be indeed an attractive one, everybody is anxious to be in the front row or near it—whether his place be pit, or dress-circle, or boxes—and, accordingly, the humbler playgoer gathers round the doors and jostles his fellow-playgoer at a quarter to seven, ere he is admitted to the theatre at seven o'clock. He is not allowed the resource which was open to the playgoer of the end of the sixteenth century, when one Gosson, the author of the *School of Abuse*, "a pleasant invective against poets, players, and such like caterpillars of a commonwealth," mentioned among the sights of the waiting-period "such heaving, such pitching and shouldering to sit by women, such giving them pippins to pass the time." For half an hour nowadays the playgoer, debarred this entertainment, gloomily surveys the empty stalls and the dimly-lighted house; then, about the advertised moment for beginning, the band straggles leisurely into the orchestra; eventually the leader gives his sign, and the long overture commences; it is finished at a quarter to eight, and the curtain rises on the familiar interior in which is laid the scene of every farce—the octagonal apartment with the cane-seated chairs, the ricketty red mahogany chiffonier, the blistering wall-paper, and the striped curtains from Tottenham Court Road. Half an hour is now passed by the comedians unhappy enough to be engaged, in the performance of practical jokes which the English taste of thirty years ago supposed to be witty because they were rough, and which the playgoer of to-day laughs at sadly, out of respect for the past. To every one concerned the traditional farce may be described in the words Théophile Gautier reserved for music, as "the most expensive noise he knew of." This noise, however, is maintained for thirty minutes, and then there is another "wait" until the curtain may rise on the piece which an hour and a half ago three persons out of every four in the theatre had already arrived to see.

It is true that there are one or two managers who have had the good sense to abolish this first piece altogether, and that there are one or two others who are careful that it shall be worth seeing, and that its sole recommendation shall not be that it is the work of some friend of the manager, who has done the manager substantial service in quite other departments of literary labour. But these are, we fear, the exceptions, and the comfort of the humbler playgoer would hardly be more consulted by the shortening of the time between the opening of the doors and the end of the overture than by the suppression of the first piece altogether, or the habitual care that the piece shall be a good one, as it is almost invariably in France.

As to the length of time that passes between the opening of the doors and the beginning of the piece which all the world comes to see, we shall be told, no doubt, that a theatre cannot be filled in ten minutes. It cannot. But it can well be filled in twenty. And the rapidity or slowness of the work depends much on the size of the staff engaged to do it. There might well be more box-keepers, and only at the one or two theatres where box-keepers do not take fees (unless they are stuck, by the foolish rich, in the frames of looking-glasses) would the increased staff add expense to the management. Generally, "the front of the house" is a source of revenue: not of ex-

pense. Generally, a box-keeper is not the paid servant of the management; but the management's customer—a prosperous speculator, who hires the cloak-room and the keys, and counts upon the shillings of the public.

FREDERICK WEDMORE.

ANOTHER week absolutely barren of production, save for the interpolation into the Haymarket programme on Thursday—too late for any considerable notice—of the *School for Scandal*, played for the benefit of the acting manager, who was fortunate enough to get Miss Neilson to be Lady Teazle. The actress, having come back from the German baths, proposes, we hear, to leave immediately for America.

MR. OGHLAN is about to go to America, where he will no doubt take engagements to act.

MESSRS. JAMES AND THORNE, if we may judge by the programmes, have by this time thought fit to retire, for a while at least, from the performance of *Our Boys*, which, having passed its five-hundredth night, will in all human probability reach its one-thousandth, since nothing that can be done for a piece by its own merits or by criticism can approach in value the substantial fact that for five hundred nights the theatre has been filled with people satisfied to see it. The result, of course, not only in the case of *Our Boys*, but in all kindred successes, is one on which author and managers are to be congratulated much more than the actors. There must be very genuine quality in any actor who can withstand the deteriorating influence of any run of several hundred nights, and there are few who can wholly withstand it. Mr. Neville acted the Ticket-of-Leave Man too often, and Miss Bateman, Leah. That is in the recollection of many playgoers. Moreover, for many actors playing one part for several hundred nights there is the inconvenience that they become identified by the public with the special character. An actor like Mr. Jefferson, freely choosing this, evidently does not feel the inconvenience of it. He is an exception. Generally the actor condemned to play one thing only becomes less of an artist and more of a mechanic. At almost the only theatre in Europe where the art is seriously studied—at the Théâtre Français—this is not allowed. There being seven performances a week, the popular piece of the season is played at five of them. At one of the two remaining ones, the actor engaged in the popular piece rests, and at the other he appears in a part which gives him variety.

MISS LYDIA THOMPSON and her company are at the Theatre Royal, Bristol.

MR. BARRY SULLIVAN is coming to London in September, to play at Drury Lane, it is announced.

TO-NIGHT the *Colleen Bawn*, at the Adelphi Theatre, gives place to *Arrah-na-Pogue*.

THE Paris Vaudeville company has started on a short tour of the Norman watering-places, with *Domino Rose* and other pieces.

M. MAURICE COSTE, the actor, has committed suicide; and Mlle. Hélène Therval, a promising young actress of comedy, has died this week.

MANY changes have taken place in the functions of the Gymnase Theatre since its foundation, fifty-seven years ago. Here is a curious notification of the approval of the scheme of the theatre by the Government of that day:—

“Le Gouvernement vient d'approuver le projet d'un nouveau théâtre destiné à former des élèves et à servir de pépinière aux théâtres lyriques et à la Comédie-Française. Il s'appellera *Gymnase Dramatique*, et aura pour acteurs tous les jeunes gens qui montreront des dispositions remarquables, et principalement des élèves du Conservatoire qui viendront y perfectionner leurs études devant le public. La Comédie-Française et les deux opéras pourront y recruter les sujets qui leur conviendront en prévenant l'administration un an d'avance. C'est donc un théâtre en faveur des autres théâtres.”

M. LÉON GAILLARD has just published a curious little study of the *Sociétariat* of the Théâtre Français. “To-day as formerly,” he says, “artists are judged by their peers, and the list of comedians who by their comrades' votes have entered the Society is a long one.” Eighty-three *sociétaires* (or “Fellows,” as it may be more convenient to call them) were named from Molière to the time of the union of the companies of the Hôtel de Bourgogne and of the Hôtel Guénégaud. From the time of that union (1680) to 1793, there were 174 Fellows admitted; and from the reconstitution of the Théâtre Français—May 1799—to July 1, 1876, there were admitted ninety-seven Fellows: in all, 304 *sociétaires*, from Molière to Mlle. Baretta, and of these the number of men has only slightly exceeded that of women.

If the new piece at the Paris Vaudeville were conducted with more clearness it would be an amusing piece, all accounts agree. *La Crise de Monsieur Thomassin* is a three-act comedy by M. Vercousin, and the intrigue is a simple one, but the author has not brought up the attention and interest of the audience to a given point, but has distributed them too much over details which are essential. M. Octave Feuillet's works of fiction explain the word “crisis” as it is here meant to be apprehended. There is an age, according to that philosopher, and no less according to M. Vercousin, at which a person of domestic habits becomes dissatisfied with those habits. It lasts, these philosophers aver, but a short time, and if the malady is treated favourably it gives place to renewed satisfaction. This is how a critic explains it, and the play of M. Vercousin to boot:—Imagine an honest *bourgeois* who has married early, and has had no youth; he has known nothing, suspected nothing, of the storms of the heart; and he has thus reached the critical age of forty-five. His wife absents herself and leaves him to be delivered to the suggestions of *la crise*. Chance throws him in the way of a person of doubtful repute; and he is prompt to lose his head about her. Monsieur Thomassin will be pushed, like a heroine of Octave Feuillet's, to the edge of the precipice; but the morality of the Gymnase will prevent his tumbling over. In a last scene of Feuillet's the heroine is reconciled with her husband. In M. Vercousin's last scene the hero is reconciled with his wife. They embrace, and the difficult time is well over. The subject, thus conceived and understood, is easily distributed over three acts:—

“Le premier est consacré à la peinture de l'intérieur bienveillant de M. Thomassin. Le second est pris tout entier par les projets incendiaires qu'il médite, et les joies désordonnées qu'il se promet chez Mme. de Valfleury. Le troisième amène le dénouement, qui renverra dans ses foyers M. Thomassin contrit et repentant.”

The part of the unfortunate Thomassin, who has to go through these experiences in which our *soldisant* philosophical dramatists so fully believe, is played by Francès, and ought, says one of the critics, to have been played by Geoffroy. Francès, who is excellent in rendering a *figure épisodique*—a type grotesquely caricatured—has neither the large style, nor the ease, nor the vivacity, for a foreground figure in the dramatist's canvas. Landrol is amusing in a smaller part.

THE Ambigu has given, *à propos* of a much-talked-of exhibition, a funny piece, entitled *Le Voyage à Philadelphie*. In these *pièces de circonstance* it is generally the circumstance that is new and not the idea, and *Le Voyage à Philadelphie* is no exception to the rule. At the Variétés, quite lately, *Une Semaine à Londres* was of the same order.

THE Palais Royal has revived *Célimare le bien-aimé*, one of the most amusing pieces in its repertory, and played now with just the old verve by Geoffroy, Hyacinthe, and Libérty, the actors who originally “created” the parts still entrusted to them.

MUSIC.

WAGNER'S “RING DES NIBELUNGEN.” (Fourth Article.)

IN proceeding to speak of the music of this most extraordinary work, even greater difficulties present themselves than in any analysis of the libretto. It is never easy to give an idea of music by mere verbal description and without the aid of quotations in music type; and the task in the present case is more than ordinarily arduous because of the entire novelty of the work both in its form and its ideas. Any technical details, even did space allow them, would be mostly uninteresting, if not unintelligible; all that will be attempted now will be to convey some general notion of the principles upon which the work is constructed, and of the points wherein it differs from the operas of its composer's predecessors.

The first point to be noticed is that, as an outcome of Wagner's art-theories, the musical form is everywhere subservient to the requirements of the drama, instead of being, as in ordinary cases, the chief factor of the work. Hence the whole of the customary forms of operatic pieces—airs, duets, &c.—are abandoned. There is hardly in the entire series of dramas one single movement which can, without modification, be detached from its context for use in a concert room. It is only in very rare cases, and for special effects, that any repetition of words is permitted; the music closely follows the development of the drama. In accordance with the same principle, there is scarcely any concerted music. Except in the second and third acts of *Götterdämmerung* there is no chorus at all, and the only instances in which more than one singer are heard together are the songs of the Rhine-daughters, one or two unimportant passages in the great duets in the first act of *Die Walküre* and the third act of *Siegfried*, the scene with the eight Walkyrs (*Walküre*, Act iii.), and the oath of vengeance taken by Brünnhilde, Gunther, and Hagen, at the end of the second act of *Götterdämmerung*, in all which cases the justification to be found in the dramatic situation. Everywhere else we find a succession of soliloquy and dialogue, just as in a play of Shakspeare.

Those who have heard *Lohengrin* in London will not be surprised to learn that Wagner nowhere makes the slightest concession either to the *amour propre* of the singer or to the taste of the public. There is most assuredly no operatic work in existence which contains so many fine singing and acting parts as the *Ring des Nibelungen*; there are very few even of the secondary characters who have not opportunities for individual display; and, though undoubtedly exacting, the parts cannot be called ungrateful. But nowhere is a *bravura* passage or a *cadenza* introduced merely for the gratification of the vocalist, or to tickle the ears of the public; nowhere is there a break in the music to afford an opportunity to applaud the *prima donna*, or pelt her with bouquets. All such manifestations, which destroy the stage-illusion altogether, must perforce be postponed to the close of the act; the individual executant must be content to sink his or her personality completely in the work. Nor are the ordinary requirements of the opera-going public any more consulted. For example, in the first two acts of *Siegfried* there is no music at all for a female voice, excepting the short solos for the bird in the tree. Both acts consist, with this trifling exception, entirely of dialogues for male voices. Under ordinary circumstances it might be expected that the effect would be monotonous; here the dramatic interest of the situations and the constant variety of the music are likely to prevent any such feeling.

From what has been said it will be inferred that the musical form which Wagner has adopted is entirely new, and such is, in fact, the case. One of the commonest charges brought against his music is that it is altogether wanting in form—that it is, in fact, a mere chaos. It has more than once been seriously stated that his later operas are nothing but an interminable series of recitatives.

So far is this from being correct that it may safely be maintained that not one-fiftieth part of the music is recitative, in the ordinary sense of that word. It is perfectly true that the character of the vocal melody depends upon the words uttered—"melodic declamation" will perhaps be a correct name for the treatment of the voice part; but the melody is not subordinate to the declamation, as in recitative, but actually identical with it; and in this consists much of the individuality of Wagner's style. But, besides this, the task of the orchestra in expressing emotion and commenting upon the text is most important. It has been well pointed out by Gottlieb Federlein, in his masterly essays on *Die Walküre*, which appeared in the *Musikalisches Wochenblatt* for 1872, that the vocal melody with its intimate connexion with the words expresses the dramatic situation, while the orchestra depicts the attendant mental emotions. Whenever these latter are the result of the action, the orchestra is subordinate, while it is prominent when the actions spring from the emotions themselves.

It will be obvious that this new method of treating the musical drama will necessitate new forms of composition. All repetitions of words being done away with, it would be evidently absurd to repeat entire periods of music; and because Wagner has not done this he is charged, often in perfectly good faith, with want of form. This incoherence is only apparent: there is in reality a deep organic connexion between the various portions; but, from the system on which the music is constructed, this connexion cannot possibly be appreciated on a first hearing; it requires long and careful study to be able to follow the thread. And this leads to the mention of the salient peculiarity of Wagner's method—his use of "leading themes" or "Leitmotive." Each character, each incident, each important sentiment, is accompanied on its first appearance by some special musical phrase, which subsequently reappears whenever the same subject is either directly or indirectly referred to. Other composers (especially Liszt) have employed the same method, though by no means always with the same success. One of my most painful musical recollections is that of the constant and wearisome recurrence of "Leitmotive" in Liszt's *St. Elizabeth*. It is not given to every one to bend the bow of Ulysses. With Wagner, however, the themes themselves are so pregnant, and the variety of their treatment so exhaustless, that at each fresh appearance they are hailed with interest, and often powerfully heighten the dramatic effect of the work. The deep poetic insight shown in their employment is also at times very remarkable. One or two instances of this may be given in illustration. A theme of great importance throughout the entire work is that which may be termed the theme of the "Renunciation of Love." It is that to which are set the words of Woglinde in the *Rheingold*,

"Nur wer der Minne
Macht versagt," &c.,

quoted in a previous article. This theme sometimes appears in places where, on a superficial view, it seems most incongruous. For instance, in the first act of *Die Walküre*, as Siegmund is about to draw the sword out of the old ash-stem, he sings

"Heiligster Minne
höchste Noth,
sehnender Liebe
sehrende Noth
brennt mir hell in der Brust,
drängt zu That und Tod,"

to the music of the "Renunciation of Love." At first sight, nothing can appear more inappropriate than the introduction of this theme at the moment of the most ardent passion; yet in reality it has a deep significance, for by his act Siegmund (though he knows it not) is renouncing love for ever; he is fixing his own doom, and will die on the morrow; for him love shall

be no more. Again, it has been mentioned that the different "Leitmotive" are introduced with the utmost variety of form—sometimes, indeed, so much altered as to be hardly recognisable at first; but there is one theme which is a very striking exception. The theme of the "Curse" pronounced by Alberich upon his ring is never varied; from first to last it appears in precisely the same shape, thus showing that, however much all else may alter, the curse attached to the ring is unchanged and unchangeable.

Our readers will now be able to see wherein consists the difficulty of following the train of Wagner's ideas; to do this it is necessary to have the whole of the "Leitmotive," of which the work contains at least eighty, so to speak, "at one's finger's ends," to recognise each as it appears, and to see its connexion, not always apparent at first sight, with the dialogue and the dramatic action. This without long preliminary study is absolutely impossible; and it is very certain that those who hear the music at Bayreuth without any previous knowledge of it will fail to a great extent to appreciate it as a whole, however much they may be impressed with the wonderful beauty and power of isolated portions.

The question will naturally arise, Is it an advantage to art that music should be produced which requires so much study to make it intelligible? Take an ordinarily well-educated man who has no knowledge of music to hear *Don Giovanni*, and, if he have any susceptibility at all, he will come away delighted; take the same man to hear the *Rheingold*, and the chances are he will either be hopelessly confused or inexpressibly bored—perhaps both. Such music as that of the *Ring des Nibelungen* is in the highest degree intellectual; and it is no more possible for any one not musically educated properly to appreciate it than it would be for a child of six years of age to understand Carlyle's *Sartor Resartus*. This tendency toward abstruseness seems characteristic of all the best modern music; nowhere, perhaps, do we find it more strongly marked than in the finest works of Brahms. The days of the childish simplicity of Haydn, of the limpid clearness of Mozart, have gone for ever; our musicians have eaten of the tree of knowledge, and we must take the consequences. We may regret this, but it is useless to ignore it.

Wagner's wonderful mastery of orchestration is well known; but nowhere has he produced such marvellous effects of tone-colour as in the scores of the present work. He has employed a much larger orchestra than usual; as a musical curiosity many readers may be interested by a list of the instruments used. They are the following:—sixteen first and sixteen second violins, twelve violas, twelve violoncellos, eight double-basses, three flutes, one piccolo flute, three oboes, one corno inglese, three clarinets, one bass-clarinet, three bassoons, eight horns, two tenor-tubas, two bass-tubas, one contrabass-tuba, three trumpets, one bass-trumpet, three trombones, one contrabass-trombone, two pairs of kettledrums, one side-drum, one triangle, one pair of cymbals, one gong, one glockenspiel, and six harps. It will be seen that with such an instrumental force as this, the resources at the disposal of the composer are absolutely exhaustless; and, though it will readily be imagined that in reading such a score, which often contains from twenty-five to thirty staves, it is by no means easy to realise with the mind's ear the full effect of the very elaborate combinations, I feel perfectly safe in affirming, even before I hear the work, that many absolutely new shades of orchestral colouring have been obtained. Did space allow, it would be most interesting to enlarge upon this subject; only one important feature can be mentioned here. By increasing the number of each kind of wind-instrument used, Wagner has been able to produce a complete four-part harmony of any one particular quality of tone. Thus we can get with the brass four different shades, by chords on four horns, four

tubas, four trombones, or four trumpets, and the contrasts between these various groups are sometimes (as, for instance, in the second act of *Die Walküre*, in the scene between Brünnhilde and Siegmund) wonderful in their effect.

A question will probably suggest itself to many, as to what will be the effect of the work as a whole. Of this it is very difficult to speak with absolute certainty from mere reading; a few remarks can, however, be made on this point. In the first place, there can be not the least doubt that the impression produced, whether it be thought agreeable or not, will be totally different from that made by any ordinary operatic performance. The usual relations between music and words being changed—in places one might almost say reversed—the former, apart from any question of its intrinsic merit, must needs affect the hearer in quite another manner than that in which it does when it is, so to speak, the be-all and the end-all. There are many parts of Wagner's music which it is extremely difficult to estimate apart from the stage—this is particularly the case with certain parts of *Siegfried* and *Götterdämmerung*—there are even certain portions in which it is so difficult from mere reading to grasp fully the composer's idea that after repeated and close study I still feel bound to reserve my opinion upon them till I have heard them in their proper place. It is very possible, not to say probable, that some of the passages which in mere reading or playing at the piano appear the least effective may be precisely those which in performance will produce the most profound impression. Among these are the long scene between Wotan and Brünnhilde in the second act of *Die Walküre*, and that between Brünnhilde and Waltraute in the first act of *Götterdämmerung*. Those who have heard *Lohengrin* will remember the wonderfully impressive opening scene of the second act, one of the finest portions of the work, and yet one which either played on the piano or even heard in the concert-room would be tedious in the extreme. The same difference will probably be observable in many parts of the present work. On the other hand, there are numerous passages of which it is perfectly easy to tell, even from the mere reading, that the effect will be overpowering. Such are the close of the *Rheingold*, with Donner's storm-song, and the wonderful music depicting the rainbow-bridge thrown across the valley to Walhalla. Such, again, are the whole of the first and third acts of *Die Walküre*, and the most touching scene in the second act in which Brünnhilde announces to Siegmund his approaching death. The sounds of nature in the forest ("Waldweben") in the second act of *Siegfried*, and the whole of the third act, may be safely expected to produce an immense effect; while *Götterdämmerung*—as a whole, perhaps the finest of the four works—is crowded with beauties of the first order. The scene in the prelude, of the farewell of Siegfried and Brünnhilde, and the entire third act, with the stupendous funeral march following Siegfried's death, and the finale working up to a climax of indescribable power, are among the most colossal things in modern music. Whether the portions indicated will produce upon one who hears them without previous preparation, and without such acquaintance with the music as to enable him to recognise the various "Leitmotive," such an effect as they produce upon myself, it is difficult to foretell. I speak from a long and intimate knowledge of the scores, and find that each repeated reading throws a wonderful amount of new light on the music. It is not to be expected that those who only hear it once should be able fully to appreciate it; yet it is hardly conceivable that any one of ordinary musical feeling can fail to be deeply impressed by many of the passages I have named.

I must apologise to my readers for so largely obtruding my personality in these remarks. I have been unwilling to do so; but, in recording my impressions of the music, it has been difficult

to avoid it, while it has appeared necessary to say upon what those impressions were founded.

Of the *mise-en-scène* of the work, which presents apparently all but insuperable difficulties to the stage-manager and machinist, I must defer my notice till after the performance, as also of the cast of the work, simply saying of the latter that it brings together such an assemblage of the most distinguished operatic singers from the whole of Germany as has certainly never been seen at any one performance. Next week I hope to write from Bayreuth, and give some preliminary information, previous to the performance, which commences to-morrow.

EBENEZER PROUT.

THE proceeds of the Balfé Festival lately held at the Alexandra Palace are to be devoted to the foundation of a free scholarship for one year in the Royal Academy of Music; to be competed for always at Christmas by female and male candidates in alternate years. The candidates must be British-born subjects, and between the ages of twelve and eighteen. The first election will take place next Christmas.

THE performance of Prof. Macfarren's new oratorio, *The Resurrection*, at the approaching Birmingham Festival will be conducted by Mr. Walter Macfarren, brother of the composer.

A GRAND musical festival, with a choir of 4,000 singers, will be held at Amsterdam on September 9 to 11 next. Bruch, Gounod, Hiller, Liszt, Vieuxtemps, &c., are expected to be present.

It is reported that Mdme. Pauline Lucca will sing for the first time in the Italian Opera at Moscow next season. Some papers, however, announce the engagement of this lady at St. Petersburg.

VERDI'S *Aida* will be produced next winter at the Court Theatre, Dresden.

A MUSICAL CONTEST of the leading bands in the United States was announced to take place in Philadelphia on the 5th of last month; but, although the appointed judges duly assembled, not a single band which had entered for the contest put in an appearance.

THE following is extracted from the *Buffalo Courier*:-

"A portion of the musical community in New York is very much interested just now in the voice of a newly-imported singer recently arrived from Paris. Her name is Mdme. Marguerite Selvi, and she has already been engaged to sing in the choir of St. Mark's Episcopal Church. Her voice is pronounced by competent judges to be a pure tenor, and is remarkable for its clearness and strength in the upper register. She renders tenor solos with magnificent effect, and she is already regarded as a musical phenomenon. Her ability to sing without apparent effort the most difficult music written for tenors has been tested upon several occasions in the presence of some of the most famous masters in the city. Mdme. Selvi is as phenomenal as a tenor as a certain gentleman who has for a long time creditably sustained an alto part in a quartet choir attached to one of the Brooklyn churches. This gentleman is an amateur strictly, but his voice is a pure contralto. The chest notes are perfect, and upon hearing him it is difficult to believe that one is listening to a masculine voice."

A. BREIDENSTEIN, professor of music at the University of Bonn, died on July 13. The death at Bordeaux is also announced of Augustine Castan, a young singer well known in France and Belgium.

HERR AUGUST NICKEL, the Berlin musician, died at Polz, in Upper Bavaria, on July 19, from the effects of the sting of an insect.

THE Council of Trinity College, London, have decided to take up the scheme of local examinations in elementary music, recently discontinued by the Society of Arts. These examinations, at which prizes will be awarded, will be open to all comers. A new branch of the college has been established in Dublin under the care of Prof. T. R. Jozé, Mus. B., T. C. D., L. Mus., T. C. L.

LITERATURE.

Seven Letters concerning the Politics of Switzerland, pending the Outbreak of the Civil War in 1847. By Geo. Grote, Esq., author of a "History of Greece." (London: John Murray, 1876.)

WHEN Cromwell's ambassadors—John Pell and John Dury—arrived in Switzerland, they were astonished to find that the famous Republics, which had given such mighty divines as Zwingli and Bullinger to Reformed Christendom, and whose natives France was so eager to enlist in her armies, did not possess more extensive territories. The majority of Englishmen still think that as Switzerland is so small, and is never the cause of much worry or much glee upon the Stock Exchange, her politics cannot be of great moment to the other civilised nations. If the Swiss Sonderbund, and the civil war which followed upon it, stirred up Englishmen thirty years ago to take a slight passing interest in the Confederate Cantons, it was neither out of any care for Switzerland herself, nor from any sense of the importance of the Swiss struggle to civilisation, but out of concern at the possible profit which Austrian and French diplomatists might make out of the breaking-up of the ancient Eidgenossenschaft. Mr. Grote perceived, more clearly than any of his countrymen, that issues of far greater moment to Europe than the cursory diplomatic ones were involved in the conflict between the Bund and the refractory cantons of the Sonderbund.

Mr. Grote hurried to Switzerland in the summer of 1847 in order to examine the Swiss question for himself upon the spot. But he was not originally drawn thither as an English politician or as a cosmopolitan Liberal, but simply as the historian of Greece. He conceived that he should be able to study the politics of the ancient Greek States in a manner almost experimental, and from the living model, in the intricate turmoil of the loosely confederated Swiss States. It needed little foresight to predict to which side in the struggle such a man as Mr. Grote would incline; his bent is easily discovered in his admirable conspectus of the position of affairs in his first letter to his wife in September, 1847; and it is confessed plainly enough in the final letter, addressed to M. de Tocqueville after the defeat of the Sonderbund, which is published for the first time in the present edition. Nevertheless, he approached the subject as an enquirer and not as a partisan, taking the most deliberately judicial attitude, and caring mainly to get at the actual facts. His own words to

Sir G. C. Lewis in October, 1847, deserve quotation for the sake of the light which they throw upon himself as the writer of these Letters.

"In England," he wrote, "people talk about the question of the Jesuits without taking any pains to acquaint themselves with the particular facts of recent history which have envenomed it. My little volume will somewhat dispel this ignorance; though it is really amazing how little desire there is in anyone to know and appreciate the reality of the case. What people want to know is, with which of the parties they are to side, and they seem quite satisfied with the part of shouting and bitter partisans, in preference to that of discriminating critics. The longer I live, the more I see that Bishop Butler was right when he said that a man who really loved truth in the world was almost as rare as a black swan."
